Green, between Webster and Buchanan, two-story frame. Owner, Edward J. Duffield; architects, Copeland & Banks; contractor, John A. Shepard; cost, $4,906; signed, Feb. 28; filed March 1; sureties, T. H. Jones and J. P. Shepard; limit, 90 days; $1,000 fram d; $1,000 brown coated; $682 white coated; $1,000 completed; $1,224, 35 days.

Haight corner Webster, three-story frame. Owner, John Cordes; architect, B. E. Henriksen; contractors, Rountree Bros; amount, $7,755; sureties, Thos. Richardson, John Coop; signed, February 16; filed, February 19. Payments: roofed, $1,454; outside finish on, $1,454; sashes glazed and hung, $1,454; trimmings on, $1,454; $1,939, 35 days.

Harrison and Fifth, stable. Owner, J. L. Moody, architect; Chas. I. Havens; contractor, F. W. Kern; cost, $5,295; signed, Feb. 26; filed Feb. 27; sureties, Behrend Joost and O. W. Nordwell; limit, 40 days; $1,000 roof rafters on; $1,200 roof complete; $1,595 completed; $1,500, 35 days.

Howard, near Fourteenth, alterations, etc. Owner, L. Dumas; architect, M. J. Welsh; contractor, C. E. Dunshee; amount, $1,691; signed, Jan. 31; filed, Feb. 11; limit, 40 days; $600 rustic on; $600 ready to plaster; $491, completed.

Henry, between Noe and Ridley, additions. Owner and builder, P. N. Williams; cost, $2,000.

Henry between Noe and Ridley, one-story cottage. Owner, Mrs. Ford; contractor, Mr. Brown; cost, $1,300.

Jackson, near Fillmore, building. Owner Katie Jacobs, et al; architects, Salfield & Kolberg; Contractor, John T. Grant; amount, $5,087; signed, Jan 20; filed, Feb. 13; sureties, C. S. Holmes & C. Hanson; $5,000 limit, 90 days; $800 framed; $1,000 roof on; $1,000 brown coated; $1,287 35 days.

Jackson, near Mason, two-story frame. Owner, M. Hartmann; architect, Henry Geilfuss; contractor, L. M. Weissmann; amount, $3,050; signed, Jan. 28; filed, Feb. 14; $450 framed; $450 partitions set; $450 brown coated; $450 white coated; completed, $765 35 days.

Jones and Pleasant, frame building. Owner, George Whittell; architect, Clinton Day; contractor, C. A. Parker; cost $4,475; signed, Feb. 1; filed, Feb. 8; $900 ready to shingle; $800 brown coated; $800 stairs ready for painter; $856 completed; $1,119, 35 days.

Kearny and Post, shelving, glazing, etc. for store. Owners, Roos Bros; architect, Henry Geilfuss; contractor, George R. Bowles; amount, $2,250; signed, Feb. 8; filed Feb. 15; $1,687 50 set up; $562 50 35 days.

Lyon, near Grove, two-story frame. Owner, Julia A. Campbell, architect, Chas. I. Havens; contractor, John G. Adams; cost, $3,929; signed, Feb. 25; filed, Feb. 27; sureties, S. H. Harmon and F. Joost; limit, 90 days; $700 enclosed; $700 brown coated; $750 outside primed; $779 completed; $1,000, 35 days.

Liberty, near Guerrero, two-story frame. Owner, D. W. Parkhurst; architect, A. J. Barnett; contractor, Brennan Bros.; cost, $5,800; signed, Feb. 4; filed, Feb. 28; sureties, Frank P. Latson and Martin Connor, $3,000; limit 90 days. Payments to be made as work progresses, at the rate of 75 per cent. of value of work done, balance 35 days after.

Market, between Ninth and Tenth, repairs. Owner, Mrs. M. F. S. Searles; architects, Schulze & Meeker; contractor, John T. Grant; cost, $2,800; signed, Feb. 2; filed, Feb. 9; $1,000 boiler house is built and main building roofed and tinned; $1,100 completed; $700, 35 days.

Market cor Gough, repairs. Owners, Will & Finck; cost, $1,200.

Mission, near Thirteenth, two-story frame. cost; $1,800.

Market, near Noe, two-story frame. Owner, Dennis H. Boyle; architect, A. J. Barnett; contractors. G. W. Farnum and R. R. Thornton; cost $3,660; signed, March 1; filed March 1; sureties, Hugh B. Jones and Matthew Harris, $2,000; limit, 60 days; $800 main roof on; $945 brown coated; $1,000 completed; $915, 35 days.

Market near Fourth, concrete work. Owner, California Academy of Science; architect, Percy & Hamilton; contractor, George Goodman; amount, $3,294; sureties, Jeremiah Mahoney and Calvin Nutting; signed, February 2; filed, Feb.2; limit, 30 days. 75 per cent. on first Saturday of each month as work progresses; balance, 25 per cent., 35 days.

McAllister near Lott, two-story frame. Owner, Ed. E. Cook; architect, Wm. H. Wharff; contractor, F. A. Williams; amount, $4,739; signed, Feb. 21; filed, Feb. 21; limit, 90 days; sureties, H. C. Smith, $2,000; $700 framed; $700 enclosed; $700 brown coated; $700 outside carpenter work done; $754 completed, $1,185; 35 days.

McAllister, near Gough, two-story frame and barn in rear. Owner, G. Ammerup; architect, H. Geilfuss; contractors, Von Borstel & Conrad; amount, $5,350; signed, Feb. 18; filed, Feb. 19; $800 framed; $800 floor laid; outside finish on $800; inside finish on $800; completed, $1,350; 35 days.

New City Hall contracts for the plinth course let to Antonelli & Doe. Value, 14,500; for finishing rooms, to McCann & Riddle; cost, 5,700.

Nebraska near Sonoma, altering cottage and building new one. Owner, Henry Kohler; contractor, Thomas F. Mitchell; amount, $1,914; signed, Feb. 18; filed, Feb. 19; $638 old house is raised and frame of new one up; $800 brown coated; completed, $634.

Oak and Franklin, three-story building. Owner, John F. Schroeder; architect, H. D. Mitchell; contractor, Richard Sinnott; amount, $12,300; signed, February 11; filed, February 12; sureties, H. C. Smith and W. J. Adams. Payments: First floor, $2,000. rustic on, $2,000; outside frames set, $2,500; framed, $2,500; 2,300, 35 days. Limit, June 15, 1889.

Powell, near California, additions, cost, $500.

Pond, between Sixteenth and Seventeenth, two-story frame. Owner, Wm. Schottler; contractor, C. H. Murasky; cost, $2,800.

Plymouth avenue, near Patton street, one-story frame. Owner, Mrs. M. K. O'Brien; architect, M. J. Welsh; contractors, L. Cuneo & Co; amount, $1,725; signed, Feb. 13; filed, Feb. 14; limit, 70 days; $400 roofed; $400 brown mortar on; $400 completed; $525 35 days.

Point Lobos Ave. and Tenth avenue, two-story frame and barn in rear. Owner, Chas Callahan; architect, C. I. Havens; contractors, Chas. Johnson and R. J. Andrew; amount, $4,400; signed, February 6; filed, February 19; sureties, A. F. Johnson and Geo. A. Hartman; limit, 112 days. Payments: framed, $800; brown coated, $800; outside primed, $800; completed, $900; $1,100, 35 days.

Pacific, between Gough and Octavia, two-story building; Owner, Alice and Edith Hastings; architects, Percy & Hamilton; contractor, J. C. Bateman et al; amount, $6,997; signed, February 1; filed, February 5; limit, 10½ months. Payments: 75 per cent. on first Saturday of each month, of the value of work done; balance, 25 per cent, 35 days.

Sanchez and Ridley, two-story frame. Owner, D. McSweeney; architect, A. H. Daley; contractor, N. R. Ellis; cost, $4,000.

Sixteenth, between Noe and Castro, two-story frame. Owner and builder, Mr. Hyde; cost, $4,500.

Sixteenth, between Noe and Castro, two-story frame. Owner and builder, Martin Dempsey; cost, $5,000.

Sixteenth, between Noe and Castro, two-story frame. Owner and builder, Mr. Smith; cost, $4,000.

Second corner Frederick, three one-story and one two-story frames. Owner, R. Hughes; day work; cost, $5,000.

South Park between Second and Third, three-story frame. Owner, Henry Joost; architect, Casper Zinierlein; contractor, Casper Zinierlein; cost, $7,635; signed, Feb. 5; filed, Feb. 9; sureties, J. F. Kennedy; limit, 90 days; $1,500 enclosed; $1,500 brown mortar; $1,500 white mortar; $1,225 completed; $1,910, 35 days.

Seventeenth near Pond, one-story frame. Owner Mr. Henry; contractor, A. J. McKee; cost, $1,700.

Stockton, near Sacramento, brick building, May 1, 1889. Owner, James Goetz; contractor, Rhody Ringross; architect, T. J. Welsh; amount, $10,000; signed, Feb. 20; filed, Feb. 20; sureties, W. P. Doherty and Charles L. Hinckle; $2,500 basement is built, $2,500 columns set; $2,500, 3d story is up and joists set; $2,500 completed; $3,775 35 days.

Sacramento, near Lyon, two-story frame. Owner, B. B. Dobbas; architects, B. McDougall & Son; contractors, P. J. and M. Brannan; cost, $5,500; signed, Feb. 9; filed, Feb. 9; $960 frame up; $900 floors laid, etc; $1,000 brown coated, etc; $1,325 completed; $1,375, 36 days.

San Jose avenue and Army street, grading and brick work. Owner, F. Kaufman; architects, Townsend & Wyneken; contractor, I. H. Wilson; amount, $1,550; signed, Feb. 9; filed, Feb. 11; limit, 35 days; $500 raised; $600 brick work done; $390 35 days.

Steiner and Sacramento, building. Owner, Georgette Bitter; architect, Wm. Mooser; contractor, J. H. McKay; amount, $3,350; signed, Feb. 2; filed Feb. 12; sureties, E. Depiere; limit, 90 days; 75 per cent. as work progresses; balance, 25 per cent. 35 days.

Seventeenth, between Mission and Howard, two-story building. Owner, Jacques Puchen; architect, Wm. Mooser; contraetor, J. J. Lunn; amount, $3,837; sureties, Behrend Joost, C. S. Holmes; signed, January 31st; filed, February 5th; limit, 90 days; Payments: 75 per cent. as work progresses; balance, 25 per cent. 35 days.

Twenty-Eight, near Church, one-story frame. Owner, G. Rolando; cost, $800.

Twenty-Eight, near Church, two one-story frames. Owner and builder, R. Bergfield; cost, $3,600.

Twenty-Eighth, near Church, one-story frame. Owner, Winder; contractor, K. Taylor; cost, $1,800.

Twenty-Second, near Fair Oaks, double tenement, frame. Owner, James C. Blair, et al; architect, H. F. Bestor; contractors, Doyle & Son; amount, $2,950; signed, Feb. 14; filed, Feb. 16; $475 rustic on; $600 brown coated; $610 doors, sashes and glass in; $525 completed; $740, 35 days.

Tehama, between Fifth and Sixth, additions. Owner, Caroline K. Bowes; architect, R. H. White; contractors, Moore Bros.; amount, $1865; signed, February 11; filed, Feb. 13; limit, 60 days. Payments: Ready to lath, $700; white coated, $600; completed, $565.

Twenty-Fourth street, between San Jose and Guerrero street, May 1, 1889, two-story frame. Owner, Charles Thompson and wife; contractor, Christian Peterson; architect, Christian Peterson; amount, $2,850; signed, Feb. 20; filed, Feb. 20; $550 foundation in $600 framed; $600 partitions set; $600 primed on outside; $500 completed.

Texas, between Solano and Mariposa, two-story frame and basement building. Owner, J. Gardiner; architect, Wm. Fyffe; contractor, John M. Robertson, et. al.; amount, $2,600; signed, January 27; filed, February 2. No payment given.

Third and Stevenson, two-story and basement, brick. Owner, G. W. Beckh; architects, Schmidt & Shea; contractor, Chas. H. Ackerson; cost, $20,850; signed, March 1; filed, March 2; sureties, C. Hanson and C. S. Holmes; limit, 100 days; $10,000 ready for roofing; $5,600 completed; $5,250, 35 days.

Vienna and Naples, two-story frame stable. Owner, Wm. G. Loeme; architect, Emil John; contractor, Adam Miller; cost, $5,300; signed, Feb. 25; filed, March 2; limit, May 1, 1889; framed $100; outside boarded, $1,000; upper floors are laid $975; finished, 1,000; $1,325, 35 days.

Washington and Baker, two-story frame. Owner, H. C. Firebaugh; architect, J. E. Kraft; contractor, W. Plums; amount, $6,700; sureties, D. Wormser and F. Joost; signed, February 4, filed, February 5; limit, 105 days. Payments: Roof on, $1525; brown coated, $1,500; completed, $2,000; $1,675, 35 days.

AN ENGINEER'S SUIT

His Claim for Inspecting the Plans of the City Hall Commission.

Calvin Brown has commenced an action against the New City Hall Commissioners to recover the sum of $1,900, which he claims is due him for services rendered the city. The complaint sets forth that the plaintiff is a civil engineer, and was employed under a resolution adopted by the Commission in August, 1888, to make a scientific examination of the plans proposed for the new main tower, and the foundations of the McAllister street wings. He alleges that he performed the work and furnished the Commission with his views. He now asks for payment for his time and labor.

CURTIS vs. BENNETT.

A complaint filed in the Superior Court by John M. Curtis, sets forth that complainant and A. A. Bennett, on the 15th of February, 1883, formed a partnership for two years, as architects, under the firm name of Curtis & Bennett; that during the existence of said partnership they drew plans and specifications for a court house and jail to be erected at Eureka, Humboldt county, under a contract with the Supervisors of that county, for a remuneration of 5 per cent on the contract price for buildings, less $400 paid on adoption of plans and specifications. The architects superintended the work on the building until October, 1885, when Bennett, as Curtis alleges, assumed the entire superintendence of the work without the consent of Curtis. The firm partnership was dissolved on the 15th of February, 1885, and their business affairs were settled between them, except the Eureka contract. The contract price of this work was $141,580, and it is charged that Bennett received $7,079, of which he paid Curtis $448, instead of one-half, which he claims to be entitled to. Curtis prays for an accounting and judgment for the amount found to be due him.

OAKLAND AND VICINITY.

Oakland mechanics are busy, and although the price of lumber has advanced slightly it is still within bounds, and sales are larger than ever.

The number of houses built since the opening of the year is 130. Not including the cost of the several large business blocks now building, the cost of new structures will aggregate $430,000. At the present rate of growth Oakland will see an accession of fully 1,000 homes during the year, at a cost of nearly three million of dollars. From the bay to the foothills the signs of improvements are visible. The cottage predominates in numbers, and is an indication of ownership. Probably a larger proportion of the population of Oakland own homes than that of any city of like size in the United States. This evidence of thrift and prosperity is gratifying. Oakland will have a population of 100,000 by the year 1893. And this growth is mainly due to the ease with which homes are secured, by reason of the moderate rates for real estate and the facilities for purchase on the installment plan given by builders and dealers.

A larger number of contracts has been made and is being let or considered than in any previous first two months of the year in the history of Oakland. All mechanical branches are active, while the recent rains give great encouragement to hopes for a prosperous year in agricultural matters. Cities and towns will share in the prosperity.

W. T. Veitch states that he has a large amount of work in view and that the growth of Oakland is more steady and healthy than that of towns he has visited, where spasmodic increase was followed by a corresponding depression.

Mrs. T. B. Simpson is building a modern residence of eleven rooms on the northwest corner of Telegraph and Simpson avenues. Twohig & Moore, contractors; Charles Mau, architect. The cost will be $6,000.

A cottage of seven rooms, costing about $2,000 is going up on Seventh and Alice streets. It is for the Kreyenhagen estate, and W. N. Concannon is the contractor.

A. P. Patridge is building an eight room residence on Ninth street, between Chester and Center streets, to cost $2,000.

Mr. Edwards is building two cottages, one to cost $2,500, the other $2,000, on Tenth street, between Magnolia and Union.

J. N. Paul is building a cottage of six rooms on Jones street, between Telegraph and San Pablo avenues, to cost $1,500. McCracken, contractor.

V. W. Gaskill is building two cottages on Twenty-seventh street, near Grove, each to cost $1,800.

SAN FRANCISCO, APRIL 15, 1889.

On Wednesday, May 1st, 1889, at the regular monthly meeting of the San Francisco Architectural League, an interesting stereopticon exhibition on "Scenes through Italy," will be delivered by Frank Shea, Esq., architect.

San Francisco Chapter American Institute of Architects.

Never, since the first formation of the Chapter, has there been such a meeting of architects and students, as was witnessed on the evening of April 5th, at the new rooms 408 California street. In addition to a large percentage of the membership of the Chapter, many of the students of the Architectural League, and several draughtsmen from the various offices were in attendance.

George E. Voelkel was proposed for membership as a Fellow. Referred to Committee, Percy, Babson and Pissis.

Mr. Bestor remarked that E. J. Molera could not be present owing to unavoidable detainance, but it was the desire of the latter named to request the Mechanics' Institute to have at their next exhibition and to offer premiums for the best exhibit of building materials. In order to properly have the matter come before that Institution, it was proposed to have a committee appointed by the Chapter to confer with committees from other associations and decide on some course of action. He would, therefore, make a motion to that effect. Committee appointed, Bestor and Percy. The communication from the Builders' Association in regard to the appointment of a committee on "Legislation" was favorably received and on motion S. Babson and J. E. Wolfe were appointed as such Committee. Mr. Sanders then began the reading of a most interesting paper on the subject, the "Age of Iron." The speaker gradually traced the different formations, through the various geological periods; from the mine to the foundry; from the manufactory to the bridge and building where the material was to be used. The whole paper was beautifully illustrated by dissolving views. The views of various bridges throughout the world was the most complete ever seen in the city. Beginning with the massive structures of ages past, the various developments in construction were successfully shown, until the modern iron bridge with its long spans, its light and airy grandeur combined with wonderful strength, was shown in all its grandeur. All the details of construction were successfully pictured on the canvas. Turning from the subject of bridges, the speaker portrayed the uses of iron in the construction of roofs.

The lecture was listened to with profound attention, and the beautiful illustrations brought forth murmers of applause. At its close, the speaker was tendered a vote of thanks by the Chapter and the paper was ordered printed in full in the California Architect.

Many of those present were in the new rooms for the first time and expressed themselves as well pleased with the arrangements. It is already necessary to enlarge the meeting room and a further space of sixteen feet will be added, making the room sixteen feet wide by fifty-four feet in length. This will be ample for some years to come. Students' room is also on the same floor.

The next meeting will be held on Friday, May 3d. Visiting architects are always welcome to the rooms and to the meeting of the Chapter.

Venice and Rome.

Lecture Delivered by Miss Jewett, Before the San Francisco Architectural League.

The regular monthly meeting of the league was held Wednesday evening, April 3, 1889, at their rooms, 408 California Street, with Vice-President J. F. Wieland in the chair, and eighteen members present. Messrs. Smith, O'Brien and Wetmore elected members, and Messrs. Bugbee, Larsen and Pass were proposed as members of the league.

After the business of the evening was completed a very interesting lecture on "Venice and Rome" was delivered by Miss F. Jewett, the well known High School teacher, who was introduced to the league by President Louis Stone.

Miss Jewett, who recently returned from Europe, described her impressions of Venice and Rome very clearly. Her remarks were illustrated by a very fine collection of large photographs, which added greatly to the interest of her hearers.

In entering Venice, you arrive by train, in the northwestern part of the city, and are taken by gondoliers through the Grand Canal, which passes southeasterly through the city, and is two miles long, and varies from forty to sixty yards in width. She spoke of the luxuriousness of the gondolas, which glide along so quickly, and with so little apparent motion that it seems to go by magic. Especially is the feeling intensified as the gondolier stands behind the passengers, and one does not see the actua

motive power. The lady described the "Rialto Bridge," and "Bridge of Sighs," which span the Grand Canal in single arches, and are entirely built of marble. She was greatly impressed with St. Mark's Church, with the beautiful Mosaic work, of which there is 47,000 square feet in the building, and of the magnificent effect of the afternoon sun upon the gilding, and the rich mosaic work in the spandrils of the arches. The Doge's Palace and Palace of Desdemona were also described, with their beautiful gothic tracery, and immense variety of carved capitals, every one being different. A large number of photographs of the Campanile, Doge's and Desdemona's palaces, St. Mark's Church, the many bridges and other points of interest were passed around among the members, who manifested great interest, and asked many questions. From Venice, Miss Jewett carried her audience to Rome.

Rome is entirely surrounded by a wall fifty feet high and eighteen feet wide, which is complete and in excellent condition. Miss Jewett, in describing the "Strangers' quarter" in Rome, said that the streets of that part reminded her of the new portion of New York City, as there are many five-story apartment houses of modern construction, of much the same appearance. She described the monastery of the Capuchin monks, and exhibited a photograph of the interior, showing the walls and ceilings decorated with skulls, vertebrae and other parts of the bodies of monks who died there.

From describing Rome generally, she came to the center of attraction, the great church of St. Peter's and the Vatican. She was one of the 90,000 people who occupied St. Peter's during the Pope's jubilee, last June. At the jubilee, invitations were issued only to fill the nave and the transepts, or 120,000 people could have been placed in the body of the church. She spoke of the great size of the Vatican, with its 13,000 rooms, and vast retinue of servants.

The splendid photographs of the St. Peter's, Arch of Constantine, the Roman Forum, Colosseum, the many temples, statuary and fountains, were especially interesting to the league.

At the conclusion of the lecture a vote of thanks was tendered Miss Jewett for her kindness in consenting to lecture before the league.

On the 17th of this month there will be a lecture delivered on "Chemistry," by Mr. D. C. Stone, who will illustrate his subject with a number of experiments.

The following is a list of the San Francisco Architectural League's membership and its officers:

MEMBERS.

Lionel D. Deane, Geo. H. Sanders, Augustus Borradaile, J. F. Wieland, Geo. P. Wetmore, Obert F. Simpson, Joseph W. Rowell, Samuel Benson, Sylvester W. Hemenway, C. Herbert Hasty, Victor Monet, Carl Hilpisch, F. Rabin, R. M. Turner, Smith O'Brien, W. C. Mahoney, Louis Stone, Alfred Owen, J. Brady, M. G. O'Brien, H. J. Van Vlack.

BOARD OF DIRECTORS.

Louis Stone, President; J. Farley Wieland, Vice-President; Lionel D. Deane, Treasurer; S. W. Hemenway, Secretary; William Shea, Augustus Borradaile, R. M. Turner.

SEMI-ANNUAL COMPETITION

.....OF THE.....

San Francisco Architectural League.

Open to all draughtsmen and students in City of San Francisco. Subject, "Town Library," with requirements as follows: Entrance Hall, Library proper to accommodate 20,000 volumes, Librarian's and Reference rooms, Newspaper and Periodical room, Ladies' and Gent's Toilets. Location—Center of square. Material—Stone, Brick or Terra Cotta.

All drawings are to be designated by motto and accompanied by letter with name of competitor. They must be sent to S. W. Hemenway, Secretary of the League, room 6, 418 California Street, not later than May 14, 1889.

A committee of three prominent architects will be appointed by the League to decide the competition.

First prize, gold medal; second prize, silver medal.

S. W. Hemenway, Secretary. Louis Stone, President.

An Examination for Architects.

It would seem needless, after the experiences of the last few years, to urge upon our lawmakers the necessity of an examination for architects. I am not pleading for the "regulars," neither am I opposing the "quacks," but as an architect, looking after the interests of my clients and the public welfare, I must advocate measures which, in my opinion, will tend to remove the cause of many building disasters.

Our profession is made up of three distinct elements: First, students from technical institutions; second, students from the offices of architects; third, those who have "picked up" the business. Of the first element—technical students—there are two classes: those who have taken the regular four-year course, and others who have been put through by telegraph in two years. Although the number of practicing architects who have taken the four-year course is small, they exert an elevating influence upon the profession, and such a course will be the rule instead of the exception in a few years. The two-year course of the "specials" does them no harm, and when supplemented by a few years in the office of a skilled architect, they become sufficiently familiar with the profession to practice without injurious results.

Those composing the second element who have been fortunate enough to get a liberal education, and have made themselves familiar with the standard architectural work, have an aptitude for the work, and who have been connected with an architect for three or more years, have thus far proven the most successful architects. Aided by able and intelligent papers like the *American* and California Architect, these architects have brought the standard of the profession to its present elevation, and are working hand in hand with the institute graduates to raise it still higher, and at the same time are educating the public to understand the difference between good taste and abortiveness.

The third element, those who have "picked up" the business, have shown excellent judgment in choosing something to "pick up;" they display commendable ambition in seeking to elevate themselves by their own bootstraps. They certainly are not to be blamed for wishing to ally themselves with a profession, the members of which prosper only as their fellow men prosper, and the history of which is the world's history. But have the public no rights in the matter? Are important questions of construction and design to be intrusted to those who, like Miss Wozenham's relatives, have "failed in pick?"

We can liken the standard of architecture to that of literature, and the public will say, "All books can be published, why cannot all styles of buildings be erected?" But the public cannot be compelled to read all the vicious or absurd works which get into print; but we are absolutely obliged to look upon abortions in architecture, because they surround us on every side. Yet this is, perhaps, the least of the evils resulting from "picking up" the business.

That many human lives have been sacrificed because of ignorance of the principles of construction, who can deny? That today many important buildings are being erected in a manner discreditable to this age, and false in nearly every principle of construction, is a fact, which, if the matter is honestly investigated, must be acknowledged. True, our building laws are good, and our inspectors intelligent and watchful; but a skillful and conscientious architect is better than both put together.

Light, heat, and air, upon the proper distribution of which every human being is dependent, are all utterly ignored by this "picking-up" genius in architecture, as he goes blundering through the world, making life shorter and more disagreeable by his ignorance of the principles of the profession upon which he wished to grow financially fat. But, it will be asked, may not some of the first two elements be also incompetent? Are they as likely to be? And will not the examination be a fair test of the abilities of all?

We need an examination for architects. The first element does not object to it, the second will welcome it, and the public safety requires that no one ignorant of the principles of construction should be allowed to construct. W. H. M.

We are in receipt of the advertisement of the Dunning Boiler which appears on page three, with a very suggestive motto which is strikingly peculiar, as we do not know of any other steam heating boiler having such an established record. The motto is "The sun never sets upon the Dunning Boiler because it is in use all over the world." Read advertisement and apply for catalogue with full information as to its merits.

OUR ILLUSTRATIONS

The California Hotel and Theater.

THE California Hotel and Theatre Building, situated on Bush street near Kearny in San Francisco, will be one of its *representative* structures and in fact may be put down as the first strictly modern hotel and theatre building in this city. As the accompanying cut in this month's issue of the Architect indicates the style of architecture, of the front is in the modern Romanesque and the object of the architect has evidently been to produce a building which would attract notice more on account of its dignity, lines of proportion and symetry, rather than the elaboration of ornament and the crowding the front with projecting excressences so common to San Francisco architecture. The two lower stories of the front are of rock faced Arizona brown stone. Above that point the remaining stories are in red pressed brick and red terra cotta. A description of arrangement of the front would hardly be necessary as the accompanying cut gives a perfect idea of the front when finished, but it might be well to state that the arches at main entrance to theatre and at the hotel entrance are richly carved. The interior of the hotel, as well as the entrance to the theatre will be finished in the romanesque school of architecture. The interior of the theatre in the East Indian. The hotel will be supplied with every adjunct of a strictly modern and first class hotel. It will be heated by steam and lighted throughout by the incandescent electric light. In general arrangement and finish the hotel will be second to none in this country, and San Francisco can not only speak with pride of the elegant cuisine of its restaurants as it is noted for this, but will soon be able to boast of a cafe whose surroundings will aid its patrons to a better enjoyment of the good things served. Regarding the theatre, one of its most important features is the absolute safety to its patrons. It stands by itself detached from any other building, with exits and iron stairways on all sides. It has four independent exits on each floor from the auditorium and two from the stage, the aggregate width of exits being seventy-four feet. Next to the question of safety to patrons is the one of perfect lines of vision and on this point it can be definitely stated that there is not a single seat even in the back of Proscenium boxes, that do not command a view of the entire stage. The question of ventilation has been thoroughly considered, and the architect guarantees a change of air in the house every fifteen minutes, and says that the question of accoustics has given him no une siness as he has built nearly fifty theatres and holds the indorsements of the most prominent stars of the profession, regarding the perfection of the accoustic of every theatre. The stage is fitted with every modern appliance and it will be supplied with an equipment of scenery unexcelled for variety and modern effects by any theatre in the eastern metropolitan cities. The comforts of the profession has not been neglected, as an addition has been added to the building which is devoted to their use, furnishing fifteen dressing rooms, each having a window opening on to the open court and supplied with hot and cold water, marble make-up stands, etc., with toilet room on each story of addition. There are also commodious scene rooms, property rooms, etc., a carpenter shop sixty feet long disconnected from the stage.

The entire theatre is supplied with the Barnes Automatic Fire Extinguishers and with stand pipes and thirteen hose reels in plain sight and so distributed through the auditorium and stage, and adjusted that an incipient fire could be extinguished instantly without the aid of the fire department. To operate this apparatus there will be at all times in the building during an entertainment, firemen detailed by the fire warden. The theatre will be supplied with ladies' retiring and toilet rooms, and gents' smoking and toilet rooms. The opera chairs, carpets and draperies were designed expressly for this house and everything in the line of architectural design, decorations and furnishings will be thoroughly East Indian. The entire building will be practically fire proof. The building is being erected by Mrs. Kate M. McDonough who left with her family for Europe before it was commenced and whose interests are represented by her attorney, Mr. E. F. Preston of this city. The architecture and superintendence of the work was entrusted to Mr. J. M. Wood of Chicago, upon the recommendation of Messrs. Booth & Barrett, the eminent artists who will dedicate the theatre on the evening of the 13th of May, 1889, and there is no doubt but that it will be one of the greatest events in the history of San Francisco. Mr. Wood is now building the Benhawk theatre of Los Angeles, California. The Loring of Riverside, California. The Tacoma theatre of Tacoma, W. T., and is completing plans for an elegant theatre and business block at Portland, Oregon. A magnificent theatre and bachelor apartment building at Denver, Colorado and a hotel and theatre at Lincoln, Nebraska.

CUT-STONE WORK.

The stone of which the front is being built came from Flagstaff, Arizona, and is of beautiful reddish brown color, of a very dense nature and has the property of withstanding the most intense heat. It can be quarried to any size or dimension required for any ordinary purpose. Blocks have been taken out 20 feet long, 10 feet thick and 15 feet broad. Were it necessary to order larger stone, the only drawback would be the means of transportation, as the average railway car only carry a specified weight. The new Court House, now being built by O. E. Brady in Los Angeles, will have two stories of this stone, also the new Post Office in the southern metropolis, as well as numerous other buildings. Since the introduction of the stone about one year ago, the demand for it has steadily increased, until now the proprietors find it onerous to fill the many orders. The stone is handled in this part of the state by O. E. Brady, the gentleman who has put up the cut stone work of our present sketch and from the quality of work performed by Mr. Brady, the fact is evident, that he will be able to point with pride, in the future, to the new California theatre and hotel.

IRON WORK.

The iron work of the California Hotel and Theatre was furnished by the Joshua Hendy Machine Works. Our description of this massive structure would be incomplete without reference being made to the heavy cast iron columns, girders and stairs which form so important a part, and add strength to the building.

This work was performed under a contract with the Joshua Handy Machine Works, of Nos. 39 to 51 Fremont street, this city, in which corporation the City Iron Works have been merged, and this capacious and admirably arranged foundry is now situated at, and has recently been erected on the block bounded by Kearney, Bay, Dupont and Francisco streets, and where they are prepared to furnish architectural iron work, and light and heavy castings of every description. And the character of the work supplied for the use of this building attests their ability in this department.

INTERIOR WOOD WORK.

The interior wood work for this elegant structure is being manufactured by the well known firm of F. W. Kreling & Sons, 532 to 536 Market street, from designs furnished by J. M. Wood, the architect, and abound with beautiful ideas. The main entrance will be one of the features, with red oak finishes, beautifully carved. The doors will have elegantly stained glass in upper panels, the lower ones being of metal.

Removal Notices.

Chas. J. I. Devlin has moved from 330 Pine street to 240 Montgomery street. The new offices are very handsome in their appointments.

Chas. Geddes has moved from 528 California street to 415 Montgomery street.

Reid Bros, formerly of San Diego, and architects of the Coronado Beach Hotel, have opened an office in the McCreery Building, 213 Sansome street.

John W. Curtis, so long at 528 California street, has moved to the Thurlow Block, 126 Kearny street.

M. T. Welsh has moved his office to the corner of Market street and City Hall avenue.

Under a New Management.

This journal is now under the control of the "Architect Publishing Company." All accounts due are payable to the company, at their new offices, 408 California street, rooms 14, 15, 16 and 17.

Iron Beam and Girder Connection.

THE strength and safe bearing loads that rolled iron and steel beams will bear, in the tables of our text-books, are based on loads evenly applied, either upon their top, or equally on each side, as in the support of brick or other arches, so that all the resisting parts of the beam are uniformly employed in support of the load.

Fig. 4b

In figure 3, the beams *d and d1* form a girder, each bears its proportion of the load of beam *c* on its top, and the compressive and tensile resisting parts of each beam are equally employed in the manner intended in the tables of strengths and safe-bearing loads of beams; deviate from these direct applications and the beams will fail to sustain the loads given in the text-books.

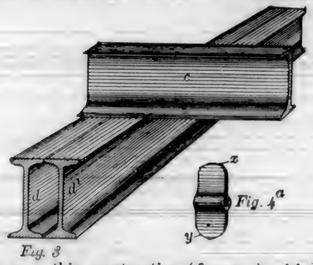

Fig. 3

Fig. 4a

In many cases this construction (*figure 3*), with the beam upon the top of the girders is not admittable for want of room, as for the support of vault roofs under sidewalks, floors of buildings and the like, to meet this requirement the faulty construction shown in figure 4 is frequently used.

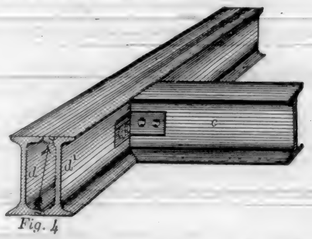

Fig. 4

In figure 4, the beams *d and d1* form the girder, and sustain the load of the end of beam *c*, but each beam of the girder is engaged quite differently than in figure 3 as hereafter explained, and it is questionable if the two are much or any stronger than *if the girder was but a single beam with the load on its top.* In this figure the single beam *d1* of the girder supports the weight of the end of the beam *c*, and to the *disadvantage of its strength upon one side*, and that upon a single bottom flange. The diaphragm *4a*. when in place, fits between the beams of the girder, and is employed as explained in the next section as a medium to *transmit the strength of beam d* to its companion beam *d1* which carries the load of the end of beam *c*.

The deflection of the beam d' from carrying the load *c* independently considered, is not directly in a downward direction, but inclines towards the side load it is carrying.

Downward deflection is resisted on the opposite side of the beam to the load, by a diagonal upward resistance or pressure from the bevel top edge *x* of the diaphragm *4a* when in place by pressing under the flange *x* of the beam. This pressure is impelled by the bottom of the diaphragm at *y* resting upon the single bottom flange *y* of the companion beam *d*.

The direction of this assisting diagonal upward force is indicated by the arrow in figure 4, and tends to further distress the already burdened beam *d1* by *forcing it abnormally* and straining it across the web.

With two solid beams of timber this severe application of the load on one side would not have the same effect.

The treatment of the loaded beam d, figure 4 may be compared to the man shown in figure *4b* carrying a heavy load in one hand sufficient for two men, bending him over in the direction of the load, and his companion assisting him (an equivalent to beam *d*) by forcing up his shoulder opposite the load, further contributing to double up the loaded man in the direction of the load.

The strength of the assisting beam *d* considered independently, loaded as it is upon the single flange *y* and upon one side, cannot be much in excess of one-half its normal strength when loaded properly on its top as in figure 3. *Therefore, the strength of the two beams d and d1 forming the girder in figure 4, may be considered not greater than a single beam girder properly loaded.*

One instance of this faulty construction is in the girder beams supporting the vault roof and sidewalk of buildings No. 309 to 317 Market street, this city, beam *d1* of the girder is deflected more than its companion beam *d* from carrying beam *c* with the incumbent vault-roof and sidewalk,and the deflection of *d1* varies in proportion as the sidewalk is loaded, causing it to leak between the beams of the girder whenever it rains.

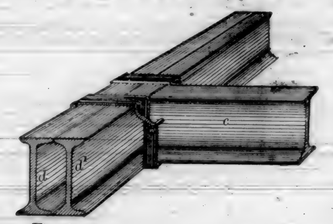

Fig. 5

Figure 5 is the same construction as figure 4, but an effort is made to remedy the fault by using a bridle or stirrup iron, one end of which is secured to the back of beam *d*, and passing over the tops of beams *d* and *d1* and down, receiyes and supports the end of beam *c*. The diaphragm *4a* is used between the girder beams with the result as described in figure 4.

The supporting value of this stirrup iron in addition to that shown and described for figure 4, is *only* what weight it will take to bend two strap irons, each a half or five-eights inch in thickness, across the edge of beam *d*, if for a 10½ inch beam would be at a leverage of 4½ inches the width of *d1*. This will not exceed 250 or 300 pounds. Figure 6 shows the stirrup iron bent from the load.

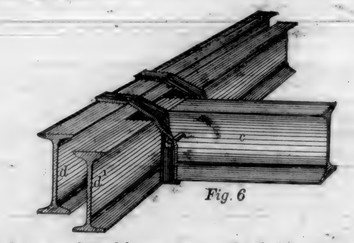

Fig. 6

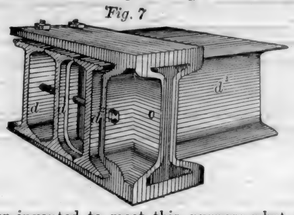
Rolled iron and steel beams are costly, their top and bottom flanges are adjusted to resist compressive force and tensile strain, and are connected by a thin web; with the load applied

in a direct manner they fulfill the intention for which they are proportioned, but deviate from it, and their strength is diminished in proportion to the treatment, and largely in cases of figures 4 and 5. This has been the writer's experience in testing over 700 iron beams and girders by weight and hydraulic pressure for the Department of Buildings of New York City.

The strength of any construction is that of its weakest part. It is evident if the top and bottom flanges at the end of beam *c* (with the web between them cut away) extended above and beneath the beams of the girder, and were bolted to each other at the back, and the junctions of the flanges to the main part of the beam was of increased thickness to provide against any possible bending, as in figure *6 a*, when employed, it would be the same as if the entire beam *c* laid on top of the girder beams, as in figure *3*.

It is evident if the top and bottom flanges at the end of beam *c* (with the rib between *them cut away*) extended above and beneath the beams of the grider, and were bolted to each other at the back, and the junctions of the flanges to the main part of the beam was of increased thickness to provide against any possible bending as in figure *6a*, when employed it would be the same as if the entire beam *c* laid on top of the grider beam as in figure *3*

Fig. 7



The writer invented to meet this purpose what is shown in figure 7, a heavy cast iron shoe, *which is rigidly secured to the end of beam c, and becomes an extended part of it*, with heavy top and bottom tongues or flanges (equivalent to the top and bottom flanges of beam *c*, with the web between cut away, as described for figure *6 a*). These project over the top and bottom of the beams of the girder and are bolted to each other at the extremity. These two flanges are equal to the single top flange of beam *c*, of a combined thickness of both. These combined tongues or flanges bolted to each other from their thickness, width and shortness of span are rigid against bending, and are fully equal as if beam *c* rested on top of all the beams of the girder, as in figure *3*.

This met the problem.

The great weight of the cast iron shoe (to be consistent in strength with remaining part of beam *c*) with the bolts, are fully 200 pounds. This, together with the expense of punching holes in the beams, makes them so costly as to forbid their general use in competition with the cheap and frail constructions before described. But they are in use in several prominent buildings in San Francisco.

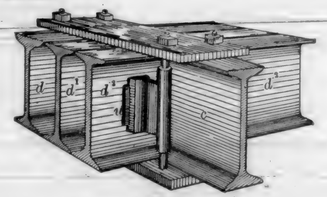


Fig 8

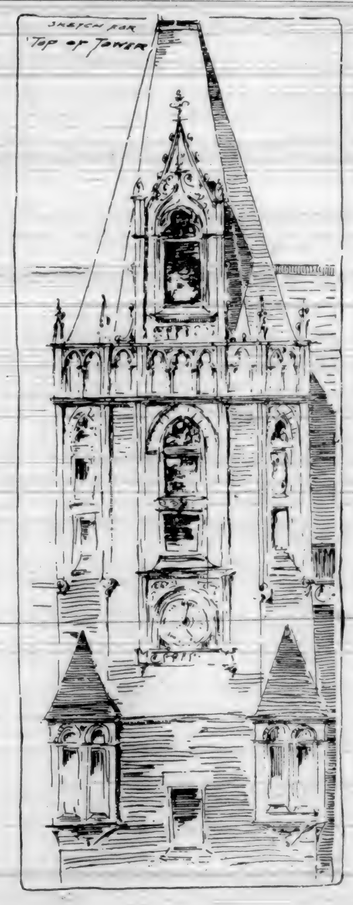
The writer afterward devised to meet the demand for a cheaper article, a wrought iron shoe, as shown in figure *8*, composed of two heavy wrought iron plates, equivalent to the two tongues or flanges described before for figure 7, of a combined thickness of 1¾ inches; these are clamped to the end of beam *c* and to the beams of the girder by heavy bolts and nuts, holding all the beams as if in a vise.

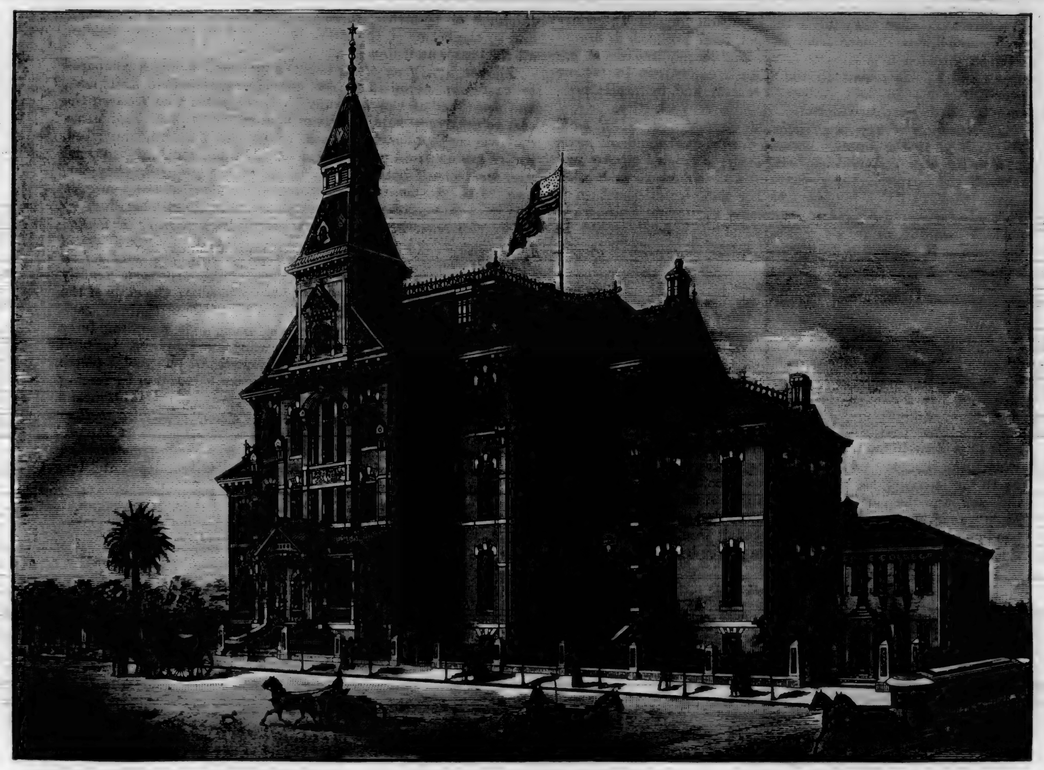
The wrought iron plates being of increased strength compared to cast iron, permitted a considerable reduction in thickness, and were then of equal strength. This construction reduced the cost to nearly one-half of those of figure 7, and at a slight increase cost over the common deceptive as to strength of the kind described. These wrought iron plates are of considerable width, and extend over the top and bottom of the beams of the girder, be they one, two three or more beams (three are shown in the figure *8*), and from their thickness and width are rigid against bending.

By this construction, none of the beams require drilling, punching, or other workmanship, but may be delivered direct from the Rolling Mill to the building or structure, and set in place, and the wrought iron plates and bolts are then readily adjusted. The end of the beam *c*, and also where the ends of the beams of the girder meet, is where they abut against each other, are so tightly clamped as to be immovable, a pulling force of tons makes no impression, requiring no fishplates to bind the ends of the beams together. In addition, the wedge pieces *u u* clamp the beams of the girder in a cross direction by forcing them over against the resisting bolts at the back. By this means *the beams of the girder are clamped transversely as well as vertically.*

Figure *1* shows the application to the best vault construction, in so far as it is all of wrought iron, and is of less depth and less cost than cast iron of equal strength.

P. H. JACKSON.





The Cogswell Technical School, San Francisco. CHAS. GEDDES, Architect.

Dr. H. D. Cogswell and Caroline E. Cogswell on March 21, 1887, executed a trust deed, setting apart certain real property to establish and endow the Cogswell Polytechnic College. The trust deeds declare the object of the college is to give the boys and the girls of the state of California a practical training in the mechanical arts and other industries.

The college is not designed to teach trades, but to fully prepare the student to enter successfully upon any line of work. The aim is to fully develop the boy and the girl, mentally, morally and physically, thereby producing self-reliant and self-helpful men and women.

This college affords students an opportunity to continue their literary, scientific and mathematical studies and at the same time, to receive a thorough training in the industrial arts.

Dr. H. D. Cogswell thus describes the importance of manual training:

"The education that does not prepare one to intelligently direct his labor is not worthy of a moment's consideration. Most of our boys and girls have no occupation, and are not prepared, to intelligently learn one, when they leave school. They have a certain kind of learning, but no capacity for work. The *new* education, demanded by the necessities of the nineteenth century calls for the training of the eye and the hand, and stamps such a training as being just as important as the study of language, science or mathematics."

COURSE OF INSTRUCTION.

The course of instruction covers a period of four years. In addition to a thorough course in principles of construction and the literature of the various languages, applied mathematics, applied science, chemistry, phonography, telegraphy, and other branches, the following will show the advantages to be derived by students of the two sexes:

For boys only, a course in mechanical art, including free-hand and mechanical drawing, carpentering, wood turning, wood carving, pattern making, iron turning, iron finishing, iron forging, iron moulding, copper and brass work, and a thorough course in the principles of machine construction.

For girls only, a course in industrial art, including clay moulding, drawing, designing, interior decoration, china painting, wood carving, metal work, plain and ornamental needle work.

THE OBJECTS OF THE SCHOOL

Are best told in the words of James G. Kennedy. "The theory on which the school is based is that education should correspond to the spirit of the people. That is, in an agricultural district it should be agricultural; in manufacturing and commercial districts it should pertain to manufacturing and to commerce, so that when a boy goes out he may have not only something to do, but be recognized as a superior workman, having intelligence outside of his practical knowledge of the use of tools. For boys we have first, a wood laboratory where they will learn to make all kinds of joints and everything else a carpenter can learn. Second, is an iron shop; third, a forging shop; fourth, a foundry; fifth, assaying laboratory.

"The girls learn first clay modeling—the basis for all kinds of modeling of brackets, chandeliers, etc. Second is drawing, third designing, fourth china painting, fifth *repousse* work—hammering out brass, gold, silver and copperwork—sixth wood carving, seventh plain and ornamental sewing. Cooking may come later, but thus far no provision has been made for it. That is merely an outline of the manual work. Of course while the pupils are pursuing their course in handicraft, they are also learning English and either Latin, French, German or Spanish, applied mathematics, etc. We will teach on the principle that it does not take a boy as long to learn the principles of physics and chemistry while working at the bench as it does to teach him the theory without the practice. We will waste no time on the study of English, but we will study English, spelling, grammar and rhetoric daily with our history or other subjects. It is my hobby that those branches which we use every time we read or talk or write should be inseparably interwoven into all other studies. It will be the teaching of the future. In future there will be no such thing as a sepapate hour devoted to spelling, one to grammar, one to composition, but all will come in with the study of history or any other branches wherein are to be found words and ideas new to the pupils. These boys will go hence with more sound practical English, grammar, higher mathematics, chemistry, physics (besides a trade they can follow) than any boy graduated from the San Francisco High School. Mind you, I don't say that when they begin they will be as rapid workmen as those who have devoted all their lives to work and work only. But after a little practice they will not only become as rapid in the accomplishment of their work but will be more valuable employes from their knowledge of the relationship their special work bears to other work in the shop. They will be superior in many other ways. I have spoken to leading founders and builders and they encourage me by promising to give the graduates of the college a fair trial after graduation. That is all I shall ask. I know that with but few exceptions the graduates of the Cogswell Polytechnical College will be acceptable in any industry they are taught."

The college buildings are on the southeast corner of Twenty-sixth and Folsom streets, and the main building faces on Twenty-sixth street. The lot fronts 245 feet on Folsom street and 182 feet on Twenty-sixth. The building is three stories in height and from its imposing and substantial appearance is the most notable structure in the southwestern portion of the city. It is seventy-one feet in width by eighty-five feet in depth, not including the projections. On each side is a wing two stories in height, each 35x40 feet. The building is surmounted with a metal roof with handsome cresting on the ridges. In front a high tower rises to the height of 127 feet, the apex topped with a revolving crystal star set in a copper pinnacle. On the face of the tower, above the third-story line, is the dial of a clock, and still lower down the name of the college. The main entrance is spacious and surrounded with a wide porch. On each side of the door is a niche for the placing of pieces of statuary. There are also two side entrances, one for boys and the other for girls. The main entrance porch is approached by a flight of stone steps. The main hallway is ten feet in width, and it opens into a cross-hallway twelve feet wide, which crosses the building from end to end. From the cross-hall stairways lead to the second story; stairs also lead to the stage at the rear and to the front of the assembly hall, in the story above. It will thus be seen that the means of egress are unusually excellent there being three wide doorways from the ground floor to the street and two from the second story to the assembly hall. There are to be ten class-rooms, each 28x30 feet, four to be on the main floor and the other six to be on the second story. Two classrooms are already ready. On the first floor also are the offices of the President and Secretary, a reception parlor, a library 16x28 feet, and a museum 20x28 feet, besides a number of dressing and toilet rooms. A spacious assembly hall occupies the entire third story. It is 68x70 feet in size, and will have a seating capacity for 1,000. It will be used for the delivery of scientific and other lectures in connection with the regular courses of study in the school. This hall will eventually be handsomely furnished and provided with a stage, with all the necessary adjuncts for completeness. All the rooms are well lighted and every appliance known to modern skill is introduced to make ventilation perfect. They are lighted with electricity, and electric bells and speaking-tubes are run throughout the structure.

A short distance in the rear of the main edifice is another building in which the shops and laboratories are fitted up. It faces the north and is 152 feet in length by 40 feet wide and two stories in height. The ground floor is devoted exclusively to iron work, both designing and molding, having departments for filing, fitting and chipping. A laboratory is established in a room 35x40 feet and fitted with all the essentials for thorough instruction in polishing, fitting and setting up of various pieces and descriptions of machinery. A machine tool laboratory is 40x40 feet in size and completely equipped with iron laths, a drillpress, planers and rollers, by the aid of which pupils will be instructed in the arts of turning, drilling and planing iron so that they will be qualified to construct tools and small pieces of machinery. A forging furnace and laboratory have also been established and occupy a space 40x40 feet. The founding laboratory will be 35x40 feet in size, and contain a smelting furnace and other necessary appliances.

The second floor will be devoted to the chemical, wood and physical departments. The carpentry department is 40x35 feet, and supplied with an extensive assortment of tools. A wood-turning factory is 40x40 feet, and supplied with lathes, a planer, a circular-saw, a bandsaw, a mortise-machine, a molder and several other machines. The remaining space on the floor will be at the disposal of the physical and chemical departments. One room, 20x20 feet in size, is fitted up with shelving inclosed in a glass front, where all the philosophical apparatus will be kept that is used in experiments in chemistry and physical instruction. The furnaces in connection with this department are in the adjoining room, 40x50 feet in size.

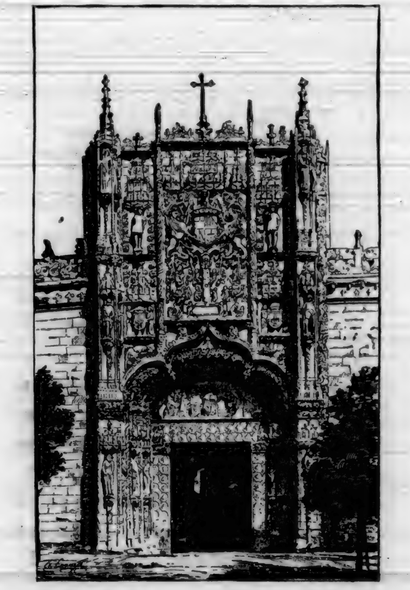
GIRLS' DEPARTMENT.

The department for instruction of girls will be fully as complete in detail as that for the boys. Here instruction will be given in wood and metal carving, sewing, cutting and fitting, as well as other mechanical studies. In the basement are well-lighted lunchrooms for the boys and girls; also rooms for the janitors and others who will reside permanently on the premises. There is also some additional space which may be utilized for classrooms or shops that may hereafter be required or found desirable. All the departments of machinery will receive motive power from a seventy-five horse power horizontal engine, which, together with the boilers, will be of the most approved pattern.

We intend to give the whole subject for which this college is founded, a thorough examination, and will report from time to time, the success, attending the efforts of those who are so nobly endeavoring to prepare the youth of both sexes to be worthy of the future government of the country's affairs.

CORPS OF TEACHERS.

The following named are those selected to preside over the various departments: James G. Kennedy, President; Mrs. Mary E. Arnold, Vice President and Superintendent of Girls' Department: Mr. A. T. Bruegel, M. E. Professor of Mathematics, Mr. Harold Howard, Professor of Modern Languages; Miss M. Van Vleck, M. I. A., Teacher of Industrial Art in Girls' Department; Miss Francis Hotchkinson, Teacher of English; Mr. J. M. Stockman, Teacher of Woodwork. Mr. G. A. Merrill, B. S., Prof. Sciences.



Good Hardware.

WE are pleased to notice an increased demand for good hardware for public buildings and residences on this coast. For the past few years there has been but little attention given to this feature of building—there being so little said in the specifications regarding it. The builder has had but little difficulty in finding locks, etc., good enough to meet the demands of his contract, his greatest difficulty has been to find them cheap enough, as for instance the architect specifies, "Mass face locks," the builder can buy them for $3 00 to $3 50 per dozen. Now any one with the average amount of common sense knows that 25 or 30 cents will not buy a lock fit to put into a door. Yet this has been one of the best markets in the United States for that class of house hardware. But property owners from past experience are becoming convinced of the importance of using a higher grade, not only of locks but of "Butts Knobs," and see that constitutes the interior hardware of a building and are treating it as they do any other feature of the structure by going personally and informing themselves in regard to the points of excellence and durability of the different styles and manufactures.

Dunham, Carrigan & Hayden Co. are taking the lead in the matter of urging the use of better goods. They have fitted up a "Bronze sample room," furnished in panels of polished woods representing the products of all parts of the world, particularly California. It would be difficult to find a more beautiful or extensive display of native woods than that which they have introduced into their room.

On these panels they have exhibited a complete line of Hopkins & Dickinson Manufacturing Co's newest designs of bronze hardware, the prominent styles "Colonial," "Grecian" rope molding, "Fluted," French" and "Italian Renaissance" are very handsome, and mark the best? of an entirely new idea in the adaptation of interior hardware to the style of architecture and inside finish, harmony and contrast, as to color, size, shape, etc. All these are shown in "Bronze," "Oxidized Silver," "Antique Brass," "Steel," "Old Copper" and "Bower Barff."

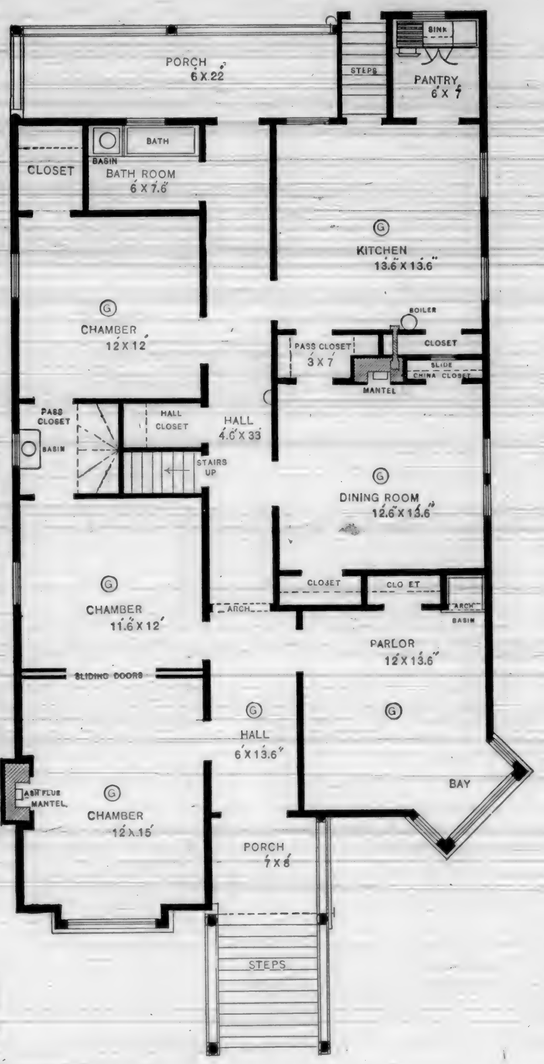
This room is fitted up extensively for the use of architects and builders who desire to take their patrons there and make selections or obtain ideas, and for those building or contemplating building. The room is always open to such, and so valuable an assistance as this to a proper choice of one of the most important features of building ought to be appreciated, and we are sure will.

Among the latest important inventions we notice Hopkins & Dickinson Manufacturing Co's new "office door cylinder locks," with the key above the knob, making key entrance easy. The key is very small and convenient to carry. These features, combined with the strength and durability of the lock, renders it most desirable for office buildings. Another fine thing is their new "hotel communicating door lock," hand made, and of the best quality.

Dunham, Carrigan & Hayden Co. cordially invite all who are interested in building to visit this department, assuring them that all specialties and novelties in their line will be exhibited in the most practical manner possible.

The Iron Age.

The paper read before the San Francisco Chapter, A. I. A., by G. H. Sanders, was ordered printed in full in the California Architect. The utmost dispatch was used in preparing the engravings, but, although we delayed publication for a few days of this issue, we found it impossible to present the paper in the artistic manner desired. So, reluctantly, we are compelled to delay the printing the "Iron Age" until our next issue. It will be the best illustrated article that has ever appeared in this Journal.



Plan of "Rio Dell Cottage."

The MAY NUMBER of this Journal will be the best illustrated issue ever presented.

THE NEW CALIFORNIA THEATRE AND HOTEL.

Architect—J. M. WOOD, Chicago.

Owner, MRS. KATE M. McDONOUGH. *Interior Wood Work furnished by KRELING & SONS.*

Iron Work furnished by JOSHUA HENDY MACHINE WORKS.

Terra Cotta Work furnished by GLADDING, McBEAN & CO. *Cut Stone furnished by O. E. BRADY*

Electroliers furnished by California Gas Fixture Co.

"Root" Boilers furnished by Geo. H. TAY & CO. *Plaster Decorations furnished by KELLETT & McMURRAY.*

New Era in Redwood Lumbering.

AN experiment was tried at Balcom & Gibbard's Excelsior mill a short time ago, the result of which is certain to bring about a new era in the manufacture of redwood lumber. The subject of kin-dried redwood for long shipments by rail has been a matter of discussion for a long time, and various projects, more or less expensive and extensive have been formulated, but not put to working test. The most practical idea heretofore was the maintenance of great lumberyards in the southern end of the state, where the lumber was to be season dried, but this incurred the keeping up of immense stocks, the cost of handling several times and consequent waste; but the project was never extensively entered into. The experiment we refer to will displace all former projects. For the requirements of their factory, Messrs. Balcom & Gibbard have set up a dryer, and a short time ago they placed in the dryer a thousand feet of redwood, fresh from the saw, some of it sawed from sunken logs, and turned on a blast of 220 degrees heat. The object was to test the resistance of redwood against checking by a high degree of heat. The blast was kept up 58 hours, and the lumber was taken out in 72 hours time, the brightest and cleanest redwood that was ever seen, without the slightest suspicion of a check. The lumber upon being placed in the dryer weighed 3,580 pounds, and upon coming out weighed 1,922 pounds, 1,658 pounds of moisture, or nearly one-half of the weight of lumber had been dried out in a little over two days, leaving the lumber in a perfect state as to brightness and grain. It is true that the practice of dryiug shingles for transportation has obtained for some time past, but now the movement toward kiln-dried lumber is likely to become general, and the operation will just about double the chances for railroad shipments, and the cost for drying is reckoned at from 50 cents to $1,00 per 1,000 feet. The Excelsior Redwood Company has already received dryers, double and single, to the extent of nine rooms, which are to be set up at once, and which will be equal to nearly one-half the output of the mill. Other mills are following in the same line. Thus it being worked another revolution in the manufacture and shipment of redwood lumber which can never be applied to other timber in so successful a manner, for the same degree of heat applied to any other kind of lumber than redwood would check or warp it entirely out of recognition. This preparation of redwood will open to it many new avenues to profitable markets.—*Eureka Watchman.*

"PICTURESQUE CALIFORNIA HOMES."

A large work containing numerous designs of California Country Architecture.

Price, - - - - $3.50

San Francisco Will Manufacture Saw Mill Machinery.

The "Vulcan" Foundry of this city is enlarging its base of operations and is reaching out to control its share of the manufacture of lumber machinery.

The Sanhedrin Mill & Lumber Company have recently contracted with the Vulcan Iron Works for the machinery for their new saw mill to cut about 50,000 feet of lumber per day; and have also selected a 60-inch heavy "Vulcan" Gang Edger, a set of heavy "Vulcan" Fractional Screw Head Blocks, also an 8x10, "Campbell" Steam Feed.

There is no reason why the "Vulcan" and the other foundries, should not absolutely control the manufacture of saw mill machinery on this coast. We propose to do what we can to this end

"From East to West."

We have received from Samuel Cabot of Boston, a copy of his book of sketches as above entitled. It contains beautiful designs of architecture as exemplified principally by New York and Boston talent. The names are given on each sketch shown, and certainly they embrace those who stand at the head of their profession. All the houses shown have been actually stained with creosote stains, manufactured by Mr. Cabot. The effect is very pleasing. Mr. Cabot proposes to thoroughly introduce these stains on this coast and has appointed T. J. Bass & Co. as his agents. Mr. Cabot proposes to print new editions of this work every few months and we can safely say that California will be represented in the next edition.

To stain brick red, melt one ounce of glue in a gallon of water; then add a piece of alum as large as an egg, one-half pound of Venetian red and one pound of Spanish brown; redness or darkness is increased by using more red or brown. For coloring black, heat the brick and dip in fluid asphaltum or in hot linseed oil and asphalt.

ACADEMY
.....OF.....
Architecture and Building
3066 South Ninth Street,
ST. LOUIS, MO.

An Institute for Theoretical and Practical Education for Building Tradesmen. Completed within three courses. Terms begin September, December and March. Students may enter in any one of these terms. The Academy will always assist its graduates in obtaining positions as Draughtsmen, Superintendents, Foremen, etc. Send for Prospectus.

H. MAACK, Principal.

CITY BUILDING NEWS.

Alabama near Twenty-fifth alterations, for owner, Ed. F. Drew; architets, M. J. Welsh; cost, $,1626; signed, March 6; filed, March 7; limit, 70 days; $400 framed; $400 brown coated; $400 completed; $426, 35 days.

Bluxome near Sixth, one-story brick warehouse. Owner, Thos Magee; architect, Chas. I. Havens; contractor, Wm. M. Fletcher; cost, $10,050; signed, March 4; filed, March 6; sureties, J. F. Kennedy; limit, 40 days; $3,050 walls ready for rafters; $4,000 completed; $3,000, 35 days.

Buchanan and O'Farrell, three-story frame; Owner, Robt. Lorentz; architect, W. Winterhalter; contractors, Borstel and Conrad; cost, $7,995; signed March 1; filed, March 5; sureties, Chas. F. and Frank P. Doe; limit, 90 days; $2,000 framed; $1,995 roofed; $2,000 completed; $2,000, 35 days.

Broderick near Hayes, two-story frame. Owner, Nancy C. Lehman; architect, Geo. Houston; contractor, Geo. Houston; cost, $3,000; signed, Feb. 27; filed, March 4; limit, 100 days; $750 shingles on; $750 brown coated; $750 doors and windows in; $750, 35 days.

ADVERTISING RATES FURNISHED ON APPLICATION.

SAN FRANCISCO, MAY 15, 1889.

The Whereabouts of Clarance E. Lane.

Should this meet the eye of any one knowing the address of a party going by above name, they will confer a favor by sending information to this office. He is a draughtsman and claims to have worked for Burnham & Root of Chicago. We simply caution every one against said party. His fare was paid to Seattle to enter a good office. On the morning of the day the steamer sailed he feloniously obtained the return of the money on his ticket and has departed for some place unknown. Country Editors and others will confer a favor by noticing the above in their respective Journals.

Our Student's and Draughtsman's Edition.

Interested parties are not giving the attention they should to preparing sketches for our student's and draughtsmen's edition. Many promised to "do what they could," but so far, have failed to make their efforts known at this office. We trust that each and every one who intends to furnish sketches or write an article, will notify us at once, so that we may know what to depend upon.

INTERESTING TO AMERICAN ARCHITECTS.

Public Companies and the N. S. W. Institute of Architects.

The extent to which architects, especially when members of any recognized institute, may enter into commercial companies has always been a vexed point and has been interpreted in all sorts of ways on different occasions. There can be little doubt that the canon of professional etiquette, which, in the words of the N. S. W. Institute rules, prohibits an architect from having "any interest or participation in any trade contract or materials supplied at any works the execution of which he may be engaged to superintend" is on the whole a desirable restriction, provided its scope is not interpreted too narrowly. An architect is essentially in a position of trust as regards his client's interests, and, while on the one hand it is desirable that temptation should not be needlessly put in his way it is absurd that on the other he should be absolutely prohibited from investing his money in any enterprise simply because its products might be used in some building in which he was employed. Such a rule strictly interpreted would materially narrow the field of investment open to the professional man, and would at once place beyond his reach all concerns with regard to which he might naturally be expected from his training to have the most perfect knowledge. Such a case has, however, recently emerged in the mother colony where the names of two well-known architects, members of the Institute, appear on the directorate in the prospectus of a limited liability company now being floated to acquire the business of a well known wholesale iron merchant in Sydney—and the fact has we understand been brought under the notice of the Secretary of that Institute. The odd thing about the matter is that one of these architects has since then notified his resignation of membership. This we think, is a pity, as it would have been of much interest to the members of the profession here if some official deliverances could be had, as to what would constitute an infringement of the declaration from which we have quoted, and which each "Fellow" on his election is required to sign. The matter is really one of great importance to their honor, and some definition of the kind we have indicated is greatly wanted.

The above is taken from the *Building and Engineering Journal* of Sydney. The same question has often been discussed before the various Chapters of the American Institute. We trust the leading members of the profession will ventilate their views on the subject matter through the columns of this Journal.

Uniform Size of Brick.

The Legislative Committee on uniform size of brick, appointed by the National Association of Builders, presented a report in which they recommended the following as a standard size to be adopted for bricks:

For common building brick, 8¼ inches x 4 inches x 2¼ inches.
For pressed brick, 8⅜ inches x 4 inches x 2⅜ inches.

After considerable discussion, the report was referred back to the Committee. The hitch seemed to occur on the word "uniform," some of the members claiming that it should be "standard." Also that the size of pressed brick should be 8¼ instead of that given in report. The subject will be considered at the next annual Convention.

In the mean while, we will be pleased to receive communications from our own manufacturers on a "standard" size for brick.

First-Class Draughtsmen Wanted.

If there are any first-class draughtsmen who are out of employment, they will confer a favor by notifying the manager of this Journal. Several good men can readily be placed in good situations.

DESIGN FOR A COUNTRY DWELLING—O. EVERETT, ARCHITECT.

Again Worthy of Notice.

We have called attention several times to the increasing demand for "Abrahamson's Ventilators." This demand has now become very general in its character, and to prove it, we present a list of the new buildings in which these ventilators will be placed.

The following contracts have been made with W. W. Montague & Co., for P. Abrahamson's New Patent Ventilator, for January and February, 1889.

St. Vincent Orphan Asylum, San Rafael, 63 ventilators; The Catholic Convent, San Rafael, 93 ventilators; Centennial Presbyterian Church, Fruitvale, 15 ventilators; Bank and Club Rooms, Sacramento, 24 ventilators: Perralto Park Hotel, Berkeley, 161 ventilators; Hotel Chico. 30 ventilators: San Jose School House, 24 ventilators; Old City Hall, San Jose; Hall of Records, Woodland, 31 ventilators; Union Insurance Company, San Francisco; Francis Smith, Beale street; The New Bank, corner Sansome and Sutter streets, 15 ventilators; Fresno Jail, 20 ventilators.

RESIDENCES.

Mr. A. N. Levy, Webster street; Mr. Kronenberg, Fulton between Gough and Franklin; Mr. Henry, San Jose; Mr. Nicoll, Manager of Bohemian Club; W. Crocker, corner California and Jones; Palace Hotel Dining rooms and other apartments; Youth's Directory, Howard, between Fifteenth and Sixteenth.

The following buildings are out for bids and Abrahamson's Ventilators are specified:

Public School House, Pleasanton California; Daniel Meyers, California street; The New Olympic Club Building; California Theatre and Hotel, Bush street; "Chronicle" building, Market and Kearny streets.

The above will clearly prove the remarks first made, that their use is *very* general.

Going to the Shop for Solder.

Editors California Architect: Will you kindly allow a lady subscriber to give a few hints in regard to plumbers and their way of "passing time." A short time ago, I had occasion to have a set of wash trays placed in my laundry. I called upon the nearest plumber to obtain an estimate. Instead of being at my place at the appointed time, it was two hours after, before he came. With the usual "plumbers soft solder," he, by his suave talk convinced me that it would be far more economical for me to have it done by day's work, as contract profits would not in that case be figured in the total. Much against my inward convictions, I allowed him to do the work on the basis of doing it as cheaply as possible. Shortly after a wagon drove up with all the materials; the charcoal fire was lighted, the irons placed therein and all apparently ready for work, when in stentorian tones the boss yelled, "Jack, you got the solder?" "Didn't fetch any," Jack replied. And so Jack had to trot down blocks away for solder. When poor Jack returned, it was discovered that no rosin was to be found, and another trip to the shop was necessary. Four times was it found a necessity for some one to go to the shop for solder. I say solder, because I *do* know the name of that article, mainly from that kind so often used by smoothly spoken plumbers. When the plumber was through his work, it required the strong arm of my gardener with a spade to scrape off the solder drops all over my floor. And the bill—well it was just $30, almost double what I had calculated. If I hire a carpenter, he can bring to my house the requisite tools and materials for completing any work he undertakes. Why, then, cannot a plumber do the same, without it being found necessary to send to the shop several times for solder?

Mrs.———

THE IRON AGE.

Paper Read Before the San Francisco Chapter, American Institute of Architects.

BY G. H. SANDERS, F. A. I. A.

Gentlemen, Fellows and Associates of the San Francisco Chapter of the A. I. A.:

Poem and Legend, Fable and Myth glow with the lustre of the Golden Age; every nation with a history, written or unwritten, has a background of romance which owes its brightness to the same luminous source.

The writings of the poets and moralists of Greece and Rome, through which the threads of authentic history have come down to us, draw their inspiration from a far away time, which, like the lingering afterglow of a glorious summer's day, tells of an era when the world was young, and mankind lived in simplicity and innocence, and enjoyed a happy immunity from the incumbrances and inconveniences of the, perhaps, overwrought civilization of their and our day.

Both Hesiod and Ovid, describe not only a golden, but a silver, a bronze and an iron age, the former interposing the heroic age between the bronze and the iron. The first four are also mentioned as forming constituent parts of the great image of Nebuchadnezzar's vision as recorded in Daniel—one of the Prophetical books of the Hebrew Scriptures. The mythology of the ancients as well as the clay records of Assyria, are replete with allusions more or less definite, to the same wondrous epoch, as well as to the degeneracy of the succeeding ages.

But authentic or fabulous as these witnesses may be, in the Genetic record alone do we find a coherent, if only figurative account of a condition of things, which could rationally afford an adequate foundation for the all pervading idea of the golden age. We shall return to the subject in our concluding remarks, and will for the present merely state, that of the four ages above recognized, the last has commonly been conceded to be the peculiar heritage of men of the present day.

THE AGE OF IRON.

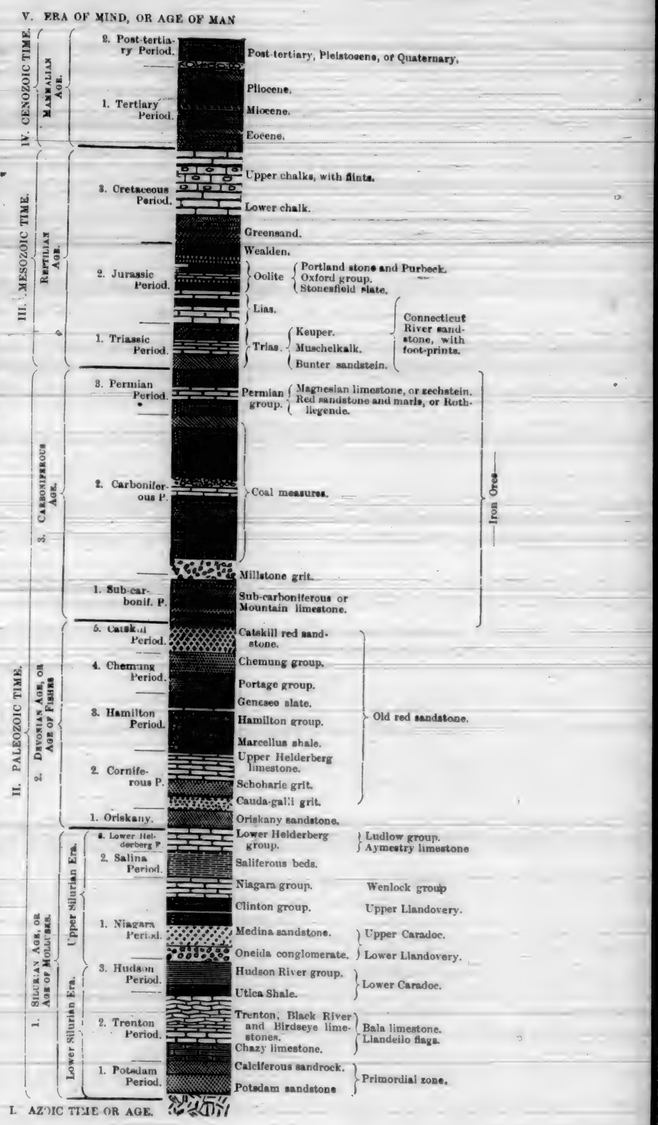
But it is not the "Iron Age," of which we wish now to speak so much as the "Age of Iron," a much more definite and easily apprehended, if less comprehensive idea, than that indicated by the former term, which indeed may be taken to include the whole range of the philosophy, sciences, arts and morals—nay, even the religion of the times, with all their respective concomitants and accessories which together make up the life of the man of the nineteenth century.

But putting aside for the present the uncertain traditions, and the myths and allegories of the days of old, the scientific explorer of our times has collected, classified, and arranged in orderly sequence, the evidences of at least three ages, neither fabulous nor figurative, which have prevailed in former times. These are known as the stone, the bronze, and our own iron age, from the material which was most generally employed during the respective periods in the ordinary implements of utility and defense, all the stages of which may be found practically existing amongst various barbarous nations of our own day and generation.

This brings us face to face with our subject proper, and the chief element of its title, viz.: Iron.

This is a substance of such world wide utility that it is apt to appear impossible to dispense with it. This, however, is disapproved by the history of past times as well as by the known conditions of many peoples and tribes of the present day, though their position and status, indeed, may be said to be measured by the degree of their knowledge and appreciation of this significant material.

To fully comprehend the true position of iron in the scale of life, we must glance at its position in the scale of creation. Accepting as such the accompanying Geological section of the shell or crust of the earth, we will ask your attention to a brief examination of its component parts and the manner of their formation—the accompanying section (1) (from Geological Section in Webster's Dictionary), which is generally taken to represent a total thickness of about thirty miles, is just about the 330th



part of the diameter of the earth, or about the comparative thickness of an ordinary egg shell.

The entire internal body of the earth has been supposed to be a molten mass, and to properly understand this we must begin at the beginning, and the beginning in this case is

GREAT NEBULA IN ORION.

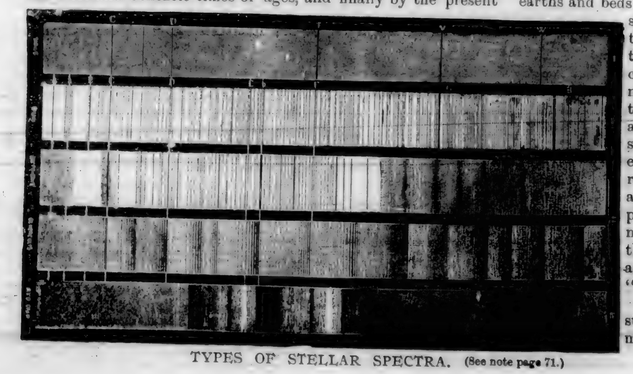
"NEBULAE."

In (No. 2, we have a representation of the great nebula in Orion, one of the most astonishing of all the star clusters in the heavens, combined as it is with clouds of incandescent hydrogen, which, by aid of the solar spectrum, indicate by the various absorption bands the presence of a number of terrestrial substances, among which those of hydrogen and the metals predominate.

The latest accepted theory in regard to these mysterious accumulations of aerial substances, appears to be as follows: As the vast masses of hydrogenous drift called nebulæ, revealed by powerful telescopes in the fathomless depths of the heavenly spaces, are caught here and there in the eddies arising from the inevitable friction resulting from ethereal motion, aggregations of condensation naturally occur, and in the vast sweep of inconceivable ages, under the influence of all pervading Law, universes of harmoniously balanced solar, planetary and lunar systems, with all their necessary and appropriate accompaniments, come into being. The diagonal of centrifugal and centripetal forces which have arisen in the case of each initial eddy, establishes a center of gravitational energy, which becomes in time a sun, and the sun in the progressive evolution of being, becomes in turn an earth, and by successive condensations and depositions of the fiery gases in the form of more and more solid materials, an orb, capable of receiving and sustaining life, slowly emerges from the womb of creation, and a world of life is born. The first rain drop which reaches the cooled surface of a new born world marks an epoch. The last that ever falls on the same earth marks another. Between them lies the history of the life of that world!

The condensation and deposition of material at first ethereal, then gaseous, then aqueous, necessarily include phenomena impossible to describe because incapable of being seen by any other faculty than that of imagination. It can only be said that what does occur must have taken place in the case of our earth in the order here represented. (No. 1.)

First: The igneous or primary rocks of the Azoic age with only the outer rim of which we can ever become acquainted; then depositions of materials caused by erosion in the earliest seas form vast strata which underlie all others and have solidified into the rocks of the second or Paleozoic series, succeeded by the Mesozoic and Cenozoic times or ages, and finally by the present time or age, known as the age of mind, or of man.



TYPES OF STELLAR SPECTRA. (See note page 71.)

The second or Paleozoic series of times or ages are divided into three great epochs, viz.: The Silurian age or age of Mollusks; the Devonian age or age of fishes, and the Carboniferous age, or age of plants; while the Mesozoic corresponds to the single age of reptiles, and the Cenozoic to the Mammalian age. All these enormous periods are divided and subdivided again and again, so that every strata has its place in the vast whole in such a way as to be readily recognizable, if not by its intrinsic characteristics, it may still be identified by those of its neighbors above and below. But of the whole, it is with the upper third of the second or Paleozoic time, called the Carboniferous age, that we have to do. The included strata are known as the coal measures, and contains a well most of the workable beds of iron ore. Associated with the coal measures also are vast strata of limestones, including the sub-carboniferous or mountain limestones, and superimposed beds of magnesian limestones—the former indispensable as fluxes, and the latter, recently found to be equally valuable as a means of purifying the ore from the phosphorous and sulphur often contained in the coal used in the process of converting the iron into steel. The iron ores also, which are principally worked, have themselves been largely the result of plant growth, as by the process of absorption of metalic vapors from the atmosphere by the vegetation, and the setting free of the mineral thus held in combination by the decay of root fibres, etc., the oxidized metal has been carried down and caught in the subjacent sandstones and clay stone rocks, and so has formed the ferrugenous earths and beds known as Iron stone, Haemetite, etc. We thus see in the very center of the scale, associated with the great belt of the coal measures, evidences of a time or age of extraordinary plant growth and of conditions of solar, aqueous and atmospherical phenomena unprecedented in the life of our planet; a time or age of light and heat storage, and of strength and energy storage, and of such other peculiar and suggestive combinations as to justify to some extent the claims of these same code measures as the real bona fide iron age afterall; or at least it would appear that by the, shall we not say, Providential provisions of the law of natural selection, all the necessary elements have been brought together for the development of this present existing wonderful age or time, which all are ready to recognize as the "Age of Iron."

The qualities of cast and wrought iron and steel are so well known as scarcely to need mention, except for the sake of reference hereafter.

Fusibility, density and inflexibility in the case of cast iron, and malleability, ductility and elasticity in the case of wrought iron or steel generally cover their respective characteristics and constitute their valuable properties. Transverse strength and resistance to crushing in the case of cast iron, and of shearing in the case of wrought iron as well as the still more valuable capacity to resist tensile strains in the case of the latter substance, are in every way enhanced in cast and wrought steel, and still other valuable properties in what is known as malleable cast iron. The Bessemer and other processes of converting pig iron into steel, or, still better, directly from the ore, by forcing a blast of atmospheric air through the molten mass of metal in a crucible, has added so enormously to the availability of steel as a lighter, stronger, and more reliable substitute for ordinary iron, for almost all purposes for which the latter has hitherto been used, as almost to constitute as great a possible development in manufactures and means of ultimating great enterprises, as the invention of the steam engine itself.

THE APPLICATION OF IRON.

But passing from this phase of the subject to the application of iron in the arts of construction, we will note its progress as an agent in the accomplishment of some of the great enterprises of the century.

When James Watts was chided by his parents for wasting his time watching the action of steam on the tea kettle lid, they little knew the tremendous revolution in the condition of the world that the boy was destined to bring about—neither more nor less than the virtual inception of the age of iron, and thereby the amelioration of the condition, and, shall we not say final civilization of the habitable world, in a way unattainable by any other means. The invention of the steam engine has led to the extension of manufactures; the conquest of the ocean by the construction of vessels of steel, rivalling in dimensions the famous Ark of old; the extension of the land by the drainage of vast areas of bog, marsh, fen, and lake; the cutting of canals, and the connection of oceans by water-ways like great rivers; the covering of continents with net works of steel rails; the prospective belting of the world by means of telegraphic cables; the conversion of our streets into checkerboards of cable cars, our business houses into "cloud capped towers" indestructable by fire; and the spanning of great rivers and arms of the sea by enormous structures in the form of bridges, before which the mightiest works of the ancients fade into dolls' houses, and the very loftiest of which we have any positive knowledge, are dwarfed into pigmies in the presence of the Eiffel tower.

BRIDGES.

LONDON OLD BRIDGE

The first illustrations to which we will ask your attention are a number of bridges. These useful structures have, in all ages, taxed the ingenuity of engineers to construct, and may be said to have been a most important means of education, in enabling him to surmount difficulties and achieve success in almost every direction in which his energies have been exerted. The first structure represented on this slide is Old London Bridge. This is a striking example of the cumbrous obstructiveness not unusual in the methods of the past. It was begun in 1178, by Peter of Cole Church, and was thirty-three years in building Often covered with large and picturesque masses of wooden buildings which were as often destroyed by fire—the main structure appears to have remained until the beginning of this century, essentially as it was built. The next illustration, which is New London Bridge, was designed by Mr. George Rennie, and built by his brother, Sir John. This a beautiful structure; having spans of 152 feet, and twenty-nine foot rise of arch, replaced the old bridge which was removed to make way for it.

LONDON NEW BRIDGE.

Waterloo Bridge was erected in 1817, and is of a similar character to the preceding, being constructed of stone in many arches, of less span, but in a wider part of the river. See next illustration.

But the next example is altogether different in material, if not in form. Until recent years, stone, brick or timber was the material almost always employed in the construction of bridges; but late in the last century cast iron began to be employed, and the specimen here shown—Southwark Bridge over the Thames, 240 foot in span of arch, is not regarded as a success, in view of the material used, as it is unnecessarily heavy and expensive.

WATERLOO BRIDGE.

The next specimen here shown, the Menai Suspension Bridge, indicates a great advance in the right direction. The use of chains or links and wire cables on the suspension principle began to be quite usual before this structure was commenced by Telford in 1819. It is 570 feet span, and has a versed sine of forty-three feet for the curve of the Catenary.

This form of bridge, however, was not at this time found suitable for railways. The objection raised on account of vibration has been obviated by the principle introduced in the next example, known as the Britannia Tubular Bridge, designed and built by Robert Stephenson in 1845. It shows a

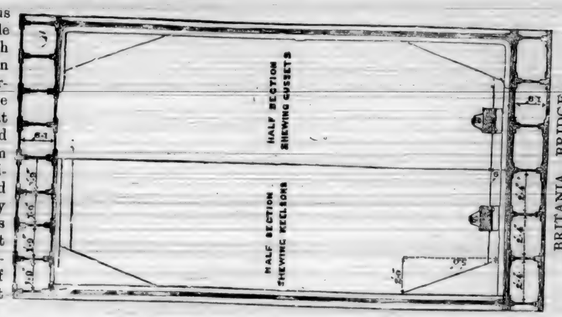
SOUTHWARK BRIDGE

complete revolution in the construction of bridges, which has led to vast results. This bridge consists of two independent wrought iron tubular beams 1511 feet long, each 15 feet wide and 23 feet high at ends, and 30 feet in center. The central pier is 230 feet high, and the two center spans are 460 feet each. The land spans on each side are 230 feet each in length. The top and bottom flanges of these immense girder tubes are cellular in construction, and the floor and ceiling are strengthened by keelsons and gussets, and the side plates are strengthened by T irons inside and out. This bridge, however, in this peculiar form has only once been repeated in the Victoria Bridge over the River St. Lawrence, in Canada which is 7,000 feet in length, and whose spans are almost equal to those of the Britannia Bridge. The mode of construction, the methods of floating the tubes into

position and raising them into their places by hydraulic pressure, and the final triumphant success of both these undertakings, together with the interesting incidents and imminent risks to which both were subject, owing to the dangerous conditions attending their construction, has almost the interest of a romance, and has raised both these enterprises, together with the name of their designer, into a prominence which can never be lost. Nevertheless, it is certain that they are never likely to be

MENAI SUSPENSION BRIDGE.

repeated, since more economical and advantageous forms of construction have arisen from the principle which they inaugurated, one type of which is the high level bridge at Newcastle. This is a combination known as the bow string girder, an open tube carried on a cast iron arch and wrought iron tie (see plan and elevation) presenting an appearance of great lightness and beauty, and being more economical, and avoiding the disadvantages of the close tunnel form so objectionable in such long structures as the Britannia and Victoria Bridges, which shut out light and air, and thefine scenery which such situations usually present; but even this form of the tubular bridge is unnecessarily expensive, and the experiment is not likely to be again made. It was simply a combination of the *truss* with the *arch* and *tube*, both of which latter are wholly dispensed with in the next



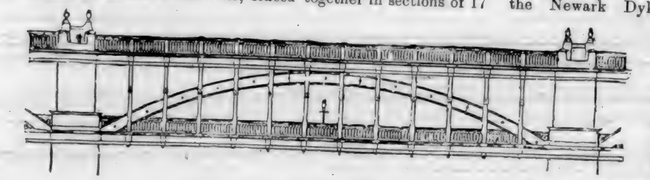
BRITANIA BRIDGE.
(Crop Section of Tubular Girder.)

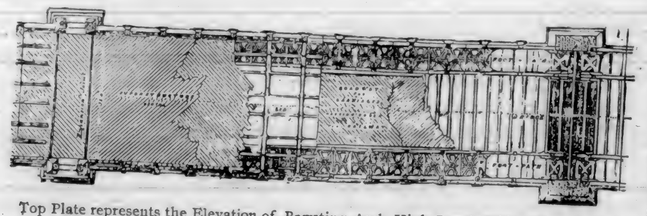
BRITANIA TUBULAR BRIDGE.

example, shown in elevation and section, which is the Newark Dyke Bridge, Cubitt Engineer, erected in 1853. It is the first, and a fine specimen of the Warren girder; and on account of its economy of construction and freedom from any unnecessary accessories, is a very frequent mode of truss construction, especially in America, in wood and iron, or both.

HIGH LEVEL BRIDGE AT NEWCASTLE.

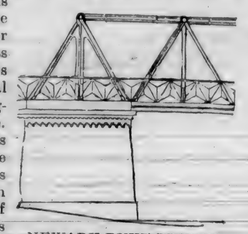
The next example is the Crumlin Viaduct, which shows another fine truss on the same principle. It consists of 10 spans of 100 to 150 feet, and is carried on piers formed of hollow cast iron columns, 12 inches in diameter, braced together in sections of 17 feet each in length. The trusses are of wrought iron, and are 14 feet 6 inches in depth. The roadway is carried on the upper string of this example, but placed on the lower string of the Newark Dyke Bridge. The next example, is the Saltash Bridge, which was erected by Brunell. It is known by the name of "Fish" girder, on account of the construction of the truss which is formed by reversed segments of circles of cast and wrought iron plating connected by vertical and diagonal bracing to which the roadway is suspended. It is, however, less economical than the forms of girders founded on the Warren type, and so has had no children. The next example, shows an example of a *wrought iron* arch bridge over the Rhine at Coblentz. But it is of no greater span, nor so economical in construction as the preceeding forms of girders, and hence cannot compete with then in universal adoption. The next example, shows the Fink type of truss. In this girder each division comprises a separate and distinct truss, all combined in one by the boom or horizontal tie which supports the roadway of the structure. It is composed wholly of vertical cast iron struts, inclined wrought iron braces, and one horizontal tie. It is a worthy competitor of the Warren girder as regards economy, but is less pleasing in form.



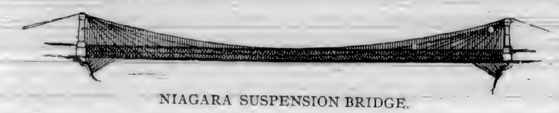


Top Plate represents the Elevation of Bowsting Arch High Level Bridge New Castle.
Lower Plate is the plan of High Level Bridge, New Castle.

The Niagara Suspension Bridge, is the next example. It crosses the Niagara River some distance below the falls at a height of 245 feet above the water by a single span of 821 feet, 6 inches. The main structure is a hollow rectangular box. The steam cars traverse the upper surface, while the carriages pass through the tube. The walls are formed of double vertical timbers with wrought iron diagonal bars crossing between them. The railway or upper floor is carried by two wire cables, while the carriage way or lower floor is carried by two others, four in all. The total sectional area of iron is 241½ square inches. This bridge was commenced in 1852, and open for traffic in 1855. It was designed and built by Roebling, and cost £80,000. The use of the two cables of different versed sines has been criticised as a defect in the principle of this bridge.



NEWARK DYKE BRIDGE.



NIAGARA SUSPENSION BRIDGE.

In this mode of construction the *tube* and the *truss* have been combined with the *suspension* principle, as introduced above, showing the progressive development of the idea of adaptation of means to ends, which is so markably a characteristic of the present age, and the drawing attention to which is one of the chief objects of this paper, especially in connection with the

FINK TRUSS.

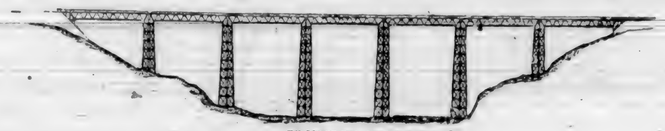
development of the same principle in architecture. The next examples of *Arch and Girder* construction, the first in America, and the other in France, show characteristic methods of spanning great spaces by permanent structures on sound principles.

The St. Louis and Illinois Bridge, over the Mississippi, is a fine example of metal arch construction. It is in three spans, the center 520 feet, side spans502 feet wide respectively, and presents a novelty in bridge building. The spans of the arches are among the widest of the kind in the world. The rise of the center arch is 47½ feet. Captain Eads was the engineer, and he must be credited with having designed and erected one of the finest bridges of any age. Each span consists of four double ribs of steel tubing, 18 inches diameter, bolted together and braced laterally and connected by wrought iron couplings, which were found better for the purpose than steel. The tubular ribs are in sections 12 to 13 feet long, and from 1¼ to 2⅛ inches in thickness. It is designed to carry a double railway below, and foot passengers above.

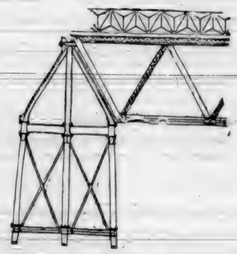
The next example, showsthe great Garabit Viaduct, lately erected by Mr. Eiffel. It is a combination of a wrought iron lattice arch carrying a lattice trussed girder. It is of great height, 640 feet span, and a very masterly work. It was built by means of suspension cables, very much on the same principle, but by different methods to that adopted in the fourth bridge shortly to be noticed, viz., without scaffolding.

ARCH BRIDGE AT COBLENTZ.

The Brooklyn Bridge, of which I here produce an illustration, is the next great work to notice. It is 1,900 feet between supports, with piers 320 feet high, and is 250 feet above the



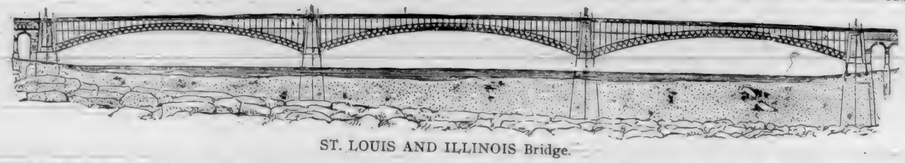
CRUMLIN VIADUCT.



PART OF CRUMLIN VIADUCT.

East River. It is a mighty structure, and a during and wonderful achievement. It also is a combination of tubular truss to secure lateral stiffness, with suspension cables as supporting agents. Cable cars, carriage roads and foot passenger ways are provided, and the whole constitutes one of the greatest of the many magnificent undertakings brought to a successful accomplishment in recent years.

The Firth of Forth Cantilever Bridge is another structure of immense proportions, and of great complexity, being a combination of wrought iron arch-tubes, vertical and inclined tubular

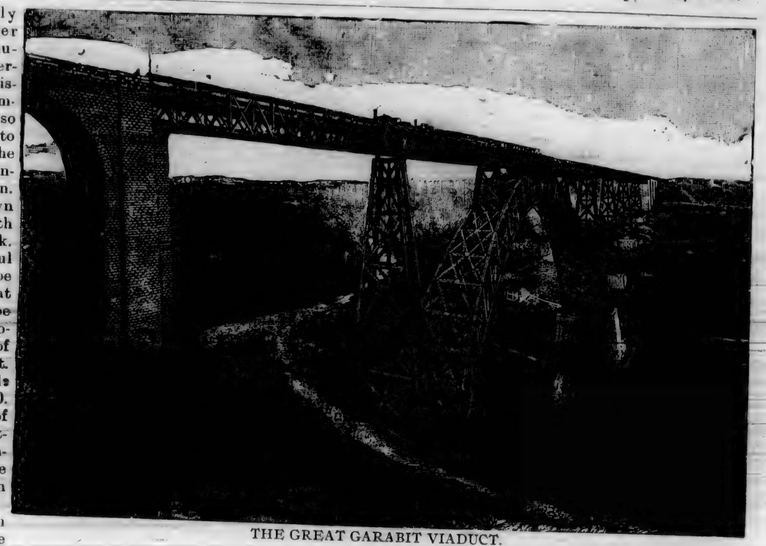


ST. LOUIS AND ILLINOIS Bridge.

columns or posts, inclined inward, double suspension bearings latticed together, and great latticed catenaries supporting a continuous box girder-tube which passes through the whole, carrying the railway track. The span is 1,710 feet, besides the side approaches. It is constructed on the stable equlibrium principle, and is wholly built of steel without scaffolding. It is without question the most stupendous structure of the kind in the world, and will scarcely be blown down like the Tay Bridge, in 1886. The above structure is a combination of arch and catenary; with the lattice principle. It is constructed by building out piece by piece from each side of the central supporting piers. It in fact provides its own scaffolding, and grows by gradual accretion of balanced parts as a tree does, and on the same principle, thus indicating a closer and closer return to nature by man as he

siduously studies her divinely economic processes, or rather those of the divinely infinite Author of *him* and *her*. Nevertheless, the apparent striking disporportion between means employed and ends subserved is so manifest in this structure as to suggest grave doubts as to the soundness of some of the principles of design employed therein.

The next example here shown you is the proposed great North River Bridge at New York. This enormous but beautiful structureasit as designed, will be fully twice as large as the great Brooklyn Bridge. It is to be 2,820 feet span between supports. The towers will be of steel, and 620 feet in height. It will cost $40,000,000, while the former cost only $5,000,000. The bridge itself is formed of latticed girders carried on latticed cables. The whole promises to be the grandest single span structure that has yet been conceived.



THE GREAT GARABIT VIADUCT.

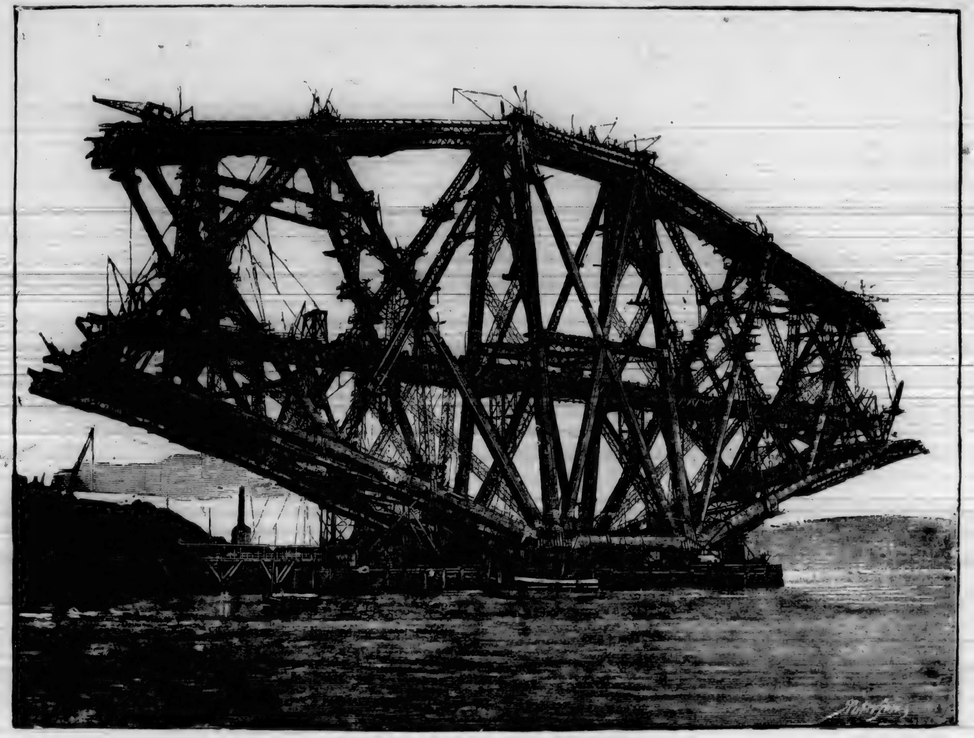
It will be seen that in each of the above structures, while the technical, the utilitarian, the objective qualifications have in every case almost wholly governed the design, the result has also partaken of the higher æsthetic ornamental and artistic qualities in a remarkable degree. From the straight simple bar-like effect of the Britannia Bridge, imposing from its magnitude and simplicity, to the great, sweeping curve of the catenaries of the proposed North River bridge, each design has presented features and combinations of features clearly expressed and resulting in a peculiar beauty which no mere architectural accessory could in any way produce. Not one of these designs depends for its effectiveness on any purely architectural detail as usually understood, but it is due entirely to the proper distribution of parts in the most efficient way that could, at the time, be reasoned out for the proper attainment of the object in hand. This we have to insist on again and again. It is the ironrule which can never be broken without departing from true principle, and with unhappy results to the beauty of the structure concerned, from the designing of the simplest moulding to the construction of a cathedral, the erection of abridge, or the building of a ship. It is the one paramount law in Art and Science, as imperative in such an apparently variable and volatile thing as a lady's bonnet, as in the construction of that useful, beautiful and significant thing, the steam engine.

To evince the truth of this proposition we will present one more well known, nay, perhaps, in past times, somewhat hackneyed example, to close this series of illustrations of the very imperfect remarks to which you have so kindly and forebearingly listened. I allude to the one great, significant, and really original building of the centuryh. The conception of no professional architect, for no architect out of 245 who competed for it, proved equal to the task: of no builder, for none were found in the length and breadth of England who could suggest such a structure; but of a mere gardener, a constructor of green houses;—I allude of course, to the Great Exhibition Building of 1851. Truly great it was, and greatest, even, it will remain, until once again the exigencies of the occasion shall override mere precedent, and some future gardener shall produce as glorious a flower from as small a seed, simply by yielding unquestioning obedience to the needs of the occasion, unfettered by rule or any existing order of things which could in any way interfere with or encumber *pure utility*. The design sprang into being, and the world of that day was both astonished and delighted. It is said that when all the designs for the Great Exhibition of '51 had been received, classified and inspected, and the commissioners, rejecting them all, had concocted one of their own, apparently as unsuitable for the purpose, as any one of them all, Joseph Paxton, chief gardener to the Duke of Devonshire, sat down in his office and in half an hour sketched out his design for the proposed building on a sheet of foolscap. Submitting his idea to one of the Commissioners, he was encouraged to perfect it. The design was published and received the unanimous approval of the nation. The contractors, Fox & Henderson, in one week prepared drawings and estimates, and in four months from that date, 18 acres were covered with glass and iron in a structure, the quiet beauty, majestic simplicity, and the unapproached convenience of which has been from that day to this, absolutely unrivalled in buildings of the kind. Every building of the sort since designed, has had accessories of various kinds breaking up its mass by useless excrescences and architectural developments, until the fantastic structures have finally lost every characteristic which made the original design great. The accompaning views, show plan, elevations, and interior view and a few details.

FIRTH OF FOTH CANTILEVER BRIDGE.

The account of the designing, and construction of this building, reads like a fairy tale, in harmony with the fairy like structure which was the charming result.

Mr. Henderson, who made every important drawing with his own hand, working 18 hours a day for seven



FIRTH OF FORTH CANTILEVER BRIDGE.

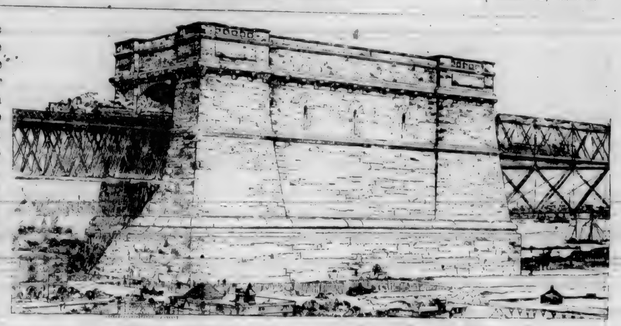
weeks, says in a speech made about that time, that hundreds of tons of glass were provided, of an unprecedented size; thousands of columns, hundreds of girders 34 miles of guttering pipes connecting the columns, which conveyed the rain water to the ground, 205 miles of sash bars, and more than 1,000,000 feet of flooring, were produced by the various firms engaged in the work, in the short space of time which was allowed to execute it. The setting out of the structure, the placing of the base blocks on concrete filled into holes dug in the ground, the raising of the columns, the lifting of the girders and keying them into their proper places in the structure, etc., proceeded with unexampled accuracy and rapidity, and, the first of its kind, and unique in the history of great expositions, the building was ready on the day when the contract expired. This was due to the entire simplicity and reduplication of every part of the structure, which again was due to the harmony of scale, which in this structure, as in the Parthenon and a few others, is perhaps after all, the most noticeable feature in the building.

Contemplating the excellent qualities exhibited by this great structure, which at the time of its erection, challenged the admiration of men of taste and judgment throughout the world, and in fact, elevated it to a level with the greatest edifices ever conceived by man, it is evident that it in no way differs in kind from any one of the great engineering works to which your attention has been directed above.

NORTH RIVER BRIDGE.

Adaptation of means to ends and that alone, in it, as in them, constitutes and includes all of its qualifications, and in this as in them, it is especially to be remarked that there is nothing imitated. No attempt is made to transfer to one material the appearance or proportions appropriate to another. On the contrary, each material is in its turn treated on its own merits, and hence its value is thereby enhanced in proportion. It is just as though the whole structure to its minutest part, was represented by two sets of figures, indicating in the first place the intrinsic value, in the other the value in application, and that both sets of figures in every case, were identical. In how many structures of the kind, erected before or since, can this be said to have been attained. In other words, that every material throughout the structure should be so applied as to attain the greatest measure of utility it is capable of, with the least expenditure of material compatible with safety, and with the best artistic effect. Would it be by adopting the forms and construction appropriate to some other and very different materials? to make iron resemble stone, for instance, or wood iron or vice versa? It is evident that there must be in such a case a great and useless waste of labor as

well as material, in other words, that the intrinsic and economical values would fail to agree. Note the admirable way in which every part of the above great building is adapted to every other part! The way in which the columns rise from ground to roof line, representing every one of the direct lines of support throughout. The way in which the connecting girders and filling in pieces are keyed rather than bolted into their places, and how directly and *easily* every part does its duty, and how by the proportioning of material to strength and position, such a degree of aerial elegance is attained that it may, perhaps, best be compared to the delicate twigs and branches of a tree divested of its leaves, whose dainty pencilings tax the skill of the artist fitly to represent. When in the full glory of its utility, it overflowed with a profusion of fabrics and materials, and objects of beauty and use from every quarter of the globe, it was like the same tree in full bloom, glowing with verdure, with color and with fruit.

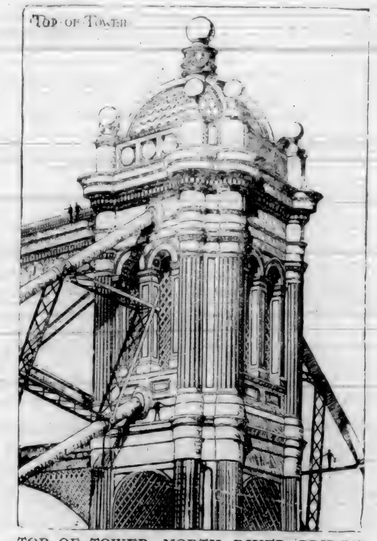


APPROACHES TO THE NORTH RIVER BRIDGE.

It seems at this point permissible to consider, as a comparative test of the proper treatment of other materials, some of the recognized qualities and properties of Iron. Whether as wrought or cast iron, or in the form of that now abundant material, wrought and cast steel, innumerable tests and experiments have settled to so large an extent the available qualities of all these substances that there is no particular need of dilating upon that subject further than may suffice to note some of the ways in which they may be better used and less abused. In the first place it must not be forgotten that all materials, without exception, are subject to change, that no material, whatever its form or qualities, is free from the liability to alter its shape; and that therefore when a perfectly spherical cast iron ball rests upon its side, it is no longer spherical, it is really oblate. That a piece of cast iron ten inches square in section and a standard foot in length, if placed resting on its extremities, is no longer a standard foot in length, and that when a great weight is placed unsymmetrically on any form of support, that support will be acted on unsymmetrically and will change its form, and the arrangement of all its molecules in the effort to adjust itself to the conditions thereby imposed upon it, which in construction means a great deal, involving as it does under given conditions the theory of re-crystallization, etc.

We are accustomed to suppose that our friends, the engineers, are the men above all others who are used to taking account of the minute changes in the form and direction of the substances and forces with which they have to deal.

But architects are expected to abolish all such changes, and to produce a structure of variable materials absolutely fixed in form for ever; at least so one would suppose from the sort of criticism to which they are at times subjected. But it is to be feared that they themselves are chiefly responsible for the inappropriate use too often made of materials, and the untoward results which frequently occur. Uniformity of material means uniformity of action in the changes which those materials inevitably undergo under the influence of temperature and strain. Some of the ways in which iron should not be used, we beg now to note.



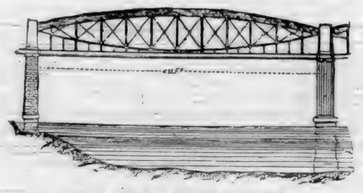
TOP OF TOWER, NORTH RIVER BRIDGE.

First: No great strain ought at any time to be thrown in an unsymmetrical manner on any unsymmetrical section of cross iron. This means an unequivocal condemnation of *brackets*. The extent to which that mode of employing cast iron is used, is remarkable

CAST IRON BRIDGE AT CRAIGELLACHIE.

when the treacherous nature of the material so used is so well known.

To founders and machinists who are well and practically acquainted with the behavior of cast iron under strain and temperature, there is nothing more objectionable than a large extent of *cross iron*, as it is called. They refuse to trust to it under any circumstances and yet we find in all the published examples an almost unlimited use of this objectionable and dangerous feature. Smooth, round columns of cast iron of small diameter, are set upon end and a number of brackets are projected from them at a sharp angle at cap and base plate, bearing heavy loads of beams and arches and this for many stories in height. Such an accident as occurred in the Owens Building, at Chicago, or an unsuspected flaw in one of the brackets or any other adequate reason, causing the snapping of one small section, may possibly occasion in a moment the destruction of a large building, hundreds of lives and much valuable property. Is this either wise or necessary? Can bad construction ever be necessary? Is it scientific? Is it artistic? That few authen-



SPAN OF SALTASH BRIDGE.

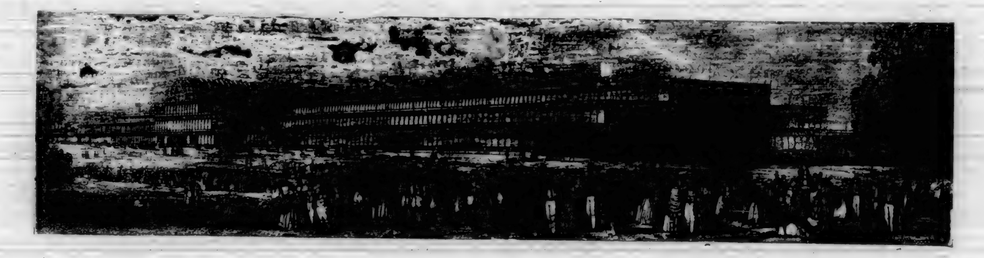
tic cases of failure of this kind can be referred to is no argument in favor of the practice. Is it not something which may occur under any sudden shock? The fall of comparatively few degrees of temperature, in view of the great inequality between bracket and shaft, must cause unequal strains in both. A settlement causing undue strain on any one part, or a local *rise* of temperature, or some stress occasioned by any one of a hundred different causes, may ultimate the conditions which may bring about a failure such as I have

BROOKLYN BRIDGE, NEW YORK.

indicated. Another wrong use of the material is indicated in the ordinary form of cast iron girder in which the upper flange is arched. This is an altogether mistaken idea, and an utterly fallacious, improper, and unscientific use of material. In the girder here shown the lower flange is straight; the shortest distance between the two ends, in the upper flange, the distance is the greatest that can be found between the two ends. In shrinking flange (A) occupying more length, shrinks more and flange (B) being shorter, shrinks less, in proportion; consequently there is an internal strain set up between the top and bottom flanges and brought to bear upon the web, which added to the weight that the girder is supposed to bear, greatly lessens its effective strength, if as in large girders of this form, (a frequent result,) it does not occasion their destruction. This is one of the principal reasons why such cast iron girders frequently snap, even before being placed in the building. The ordinary form of the rolled girder, indicates also the best general form for a cast iron girder under ordinary circumstances. Parallel flanges, the upper one-half the width and thickness of the lower, with square or inclined skewbacks at the end, indicate generally the best practical form for cast iron girders of short span.

The latticed girders used in the great exhibition building (20), were in every respect admirably adapted to the purpose for which they were intended; and either as stiffeners for the nave columns, in which position, of course, they were much lighter, or as the bearers of the gallery floors, they were found in every respect equal to their work.

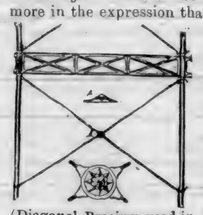
Before closing these perhaps too lengthy remarks, I will venture to indicate a few ways in which it may be found advantageous to use cast iron. Describe a circle in a square, and fill



LONDON EXHIBITION BUILDING OF 1851.

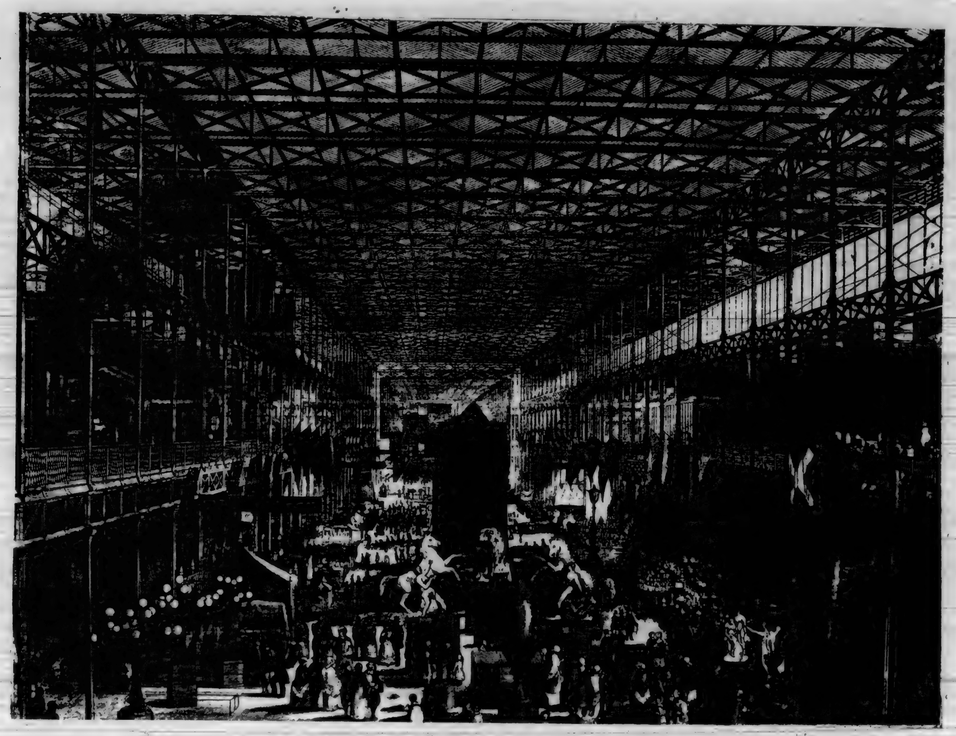
still further to increase the availability of iron as a building material.

And now a few words on the real subject of this paper, the "*Iron Age.*" Does it not occur to thinking people that there is more in the expression than is represented by the use of a single material, however useful it may be, and however varied its employment? That is why the expression was transposed in the former part of this paper as better expressing the uses and capabilities of the material itself. But in deriving a lesson from the foregoing, if lesson there be, it is necessary to revert to the broader term and the idea of the ages, and in this case, not only the scientific idea, *the age of iron*, or the esthetic idea, *the age of brass*,



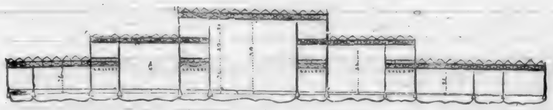
(Diagonal Bracing used in above building)

in the angles of the square with other squares; apply the thickness of one of the small squares round the circle internally, and you have the section of a cast iron column of any diameter, and any length within the prescribed limits of 30 diameters. In elevation, place the flanges diagonally (as they are drawn) to the length of the super imposed girders. Grow the flanges out into brackets of moderate projections and cast a plate of equal thickness on top, and the cap is formed. A greater projection and a proportionately larger plate forms the base. If supporting a great weight, such as a basement column, separate the base, and form circular flanges between the angle ribs, on shaft and base section, and bolt the two together. To adjust wrought I beams to this form of columns continued one or more stories in height; cut away the flanges of beams next the columns on each side (using coupled beams) and fit the same to flanges of columns, and bolt diaphram plates between those on each side of column. In this way a perfectly immovable system of columns and girders is found,



INTERIOR VIEW GREAT LONDON EXHIBITION BUILDING.

symmetrical in bearing, and adjusted to the required conditions throughout. The brackets are simply extensions of the ribs, and there is *no initial point of fracture*, and the girders, on account of being firmly held at each end, will bear double the weight of unfixed girders. If it is desired to fireproof these columns and girders, the shafts and brackets are admirably adapted thereto. One other suggestion and I will conclude this section. The subject of *Tempering* is one which does not seem to have attracted the attention of constructionists to any large extent up to the present time. A gentleman of my acquaintance in Ontario, Canada, some years ago, patented a carriage spring of peculiar merit. Instead of being made of several laminæ of thin steel, secured with rivets or loops, it was made solid, ogival in form, and tempered in an oven. The reason why springs had never been made solid before was because it was not easy to give equal temper throughout the thick and thin parts. This was secured by means of an oven of a peculiar kind. The ogival form of thespring causes the bearing to be *shortened with the increase of load*. Why is not this a principle which might be taken advantage of in designing cast or wrought steel lattice girders, and why should they not be tempered? The tempering alone, the gentleman informed me, added 300 per cent. to the strength of the springs.



VERTICAL SECTION, EXHIBITION BUILDING.

The lately invented method of rendering iron unoxidizable, known as the "Bower-Barf" process, by which a film of carbonate of iron is formed on the surface of the metal, seems calculated or even the intellectual and rational idea, *the age of silver*, but the far, higher and nobler idea by which for wood we bring *iron*, and for iron *brass*, and for brass we bring *silver*, and for silver *gold*, so that all the ages are found to be for all times and for all occasions, provided only we choose so to have it. For all materials, all things, all occasions, nay, the world itself, is naught and practially vanishes like the baseless fabric of a dream, but for the *mind of man*, his understanding of *truth*, and his desire for *good*. Without this *silver* and this *gold*, he sinks to a level with the dust from whence he rose. With this he rises into an image of his Maker, the one only and absolute impersonation of that law which is the same for the dew drop as for the world. For the created as for the creator; for the rational, thinking, willing, acting human embodiment as for the divine, and omnipotent, omnipresent and omniscient Love, Wisdom and Life from whence and by which all things live and move and have their being.

The following paragraph was unintentionally omitted in connection with the cut "Types of Stellar Spectra," on page 63:

In the accompanying bands of "Fraunhofers'" lines are seen the distinctive spectra of Sirius (the nearest fixed star) the Sun and other stars in which not only the lines of hydrogen, iron and magnesium are distinguishable, but those of a great variety of mineral salts and other substances. Thus presaging not only the compositions of the planets and our own earth, but our own bodies as well; and by analogy of natural conditions to spiritual causes, therein may also be seen reflected the based elements of our *minds*—which, in turn, are but the organized forms of the *organizing principles* which primarily exist in the great First Cause of all.

Which finds expression in devotion to the ineffably spiritual principle of essential goodness as to *quality*, and resulting truth of corresponding *form* in men and things.

In the matter of the illustrations we are indebted to the courtesy of the *Century Company*, the *Scientific American* and others who have kindly allowed us the privileges of their publications.]

San Francisco Architectural League.

The regular monthly meeting of the San Francisco Architectural League, was held at its rooms, 408 California street, on Wednesday evening, May 1st, with twenty-five members and fifteen visitors present.

An interesting lecture and stereopticon exhibition was given, by Frank T. Shea, Esq., on "Scenes through Italy," which occupied the entire evening.

Special business meeting of the League, was held May 8th, with twelve members present, President Stone in the chair. The minutes of the last meeting were read and approved. Committee on Investigations reported favorably in the cases of Messrs. Larsen, Bugbee and Parr, as senior members and the gentlemen were duly elected.

Communication from G. H. Wolfe was placed on file. Mr. Deane moved to suspend the rules; motion carried. Amendments were made to Article 1, Section 1.—to read as follows: The Board of Directors shall organize immediately after their election by the selection of a President, Vice-President, Recording and Financial Secretary, and Treasurer. Amendment was carried. Article 7, Section 3.—to read as follows: The secretary shall keep the minutes of the League, attend to all correspondence, preserve a register of all members and report semi-annually.

Article 7, Section 4.—The financial secretary shall preserve a register of all members, collect and pay to treasurer all money due to and received by the League.

Article 2, Section 4.—Application for membership, for either senior or junior shall be accompanied by drawing in either pen or pencil, and on the favorable report of the Investigating Committee, the Board of Directors shall decide whether the applicant shall be admitted as a senior or junior member.

Article 8, Section 1.—That monthly dues for all members of the League be 50 cents.

The reports of the Treasurer and Secretary were read and referred to the Board of Directors.

It was moved and seconded that all the seniors be nominated as Board of Directors; carried.

The exhibition of the drawings for library completion, will be held Wednesday eve, May 29th, 1889.

A class in "Water Colors" will be organized under the auspices of the League, with Lionel D. Deane as instructor, for Saturday afternoon from 3:30 to 5 P. M., at the rooms 408 California street. Application to be sent to the secretary.

In examining late improvements in bath room appliances, our attention has particularly been called to the Star Metal Cored Rubber Stopper, a cut of which appears above.

These stoppers were introduced about twenty years ago, by the Wm. Powell Co. of Cincinnati, Ohio. The first ones manufactured hardly gave satisfaction. Now, however, they present a stopper perfect in all its appearances. The metal core is completely enveloped in a rubber casing, the core extending up into the neck, thereby preventing any strain on the rubber and its weight is sufficient to prevent it floating from its socket.

The sole manufacturers of these stoppers is the Wm. Powell Co., 50 Plum St., Cincinnati, Ohio. A letter addressed to them will receive prompt attention.

$500 for a $3,000,000 Plan.

The "Best Plan" is wanted for a $3,000,000 Capitol building for Salt Lake City. For the same, the Board of Commissioners through their Secretary, Geo. E. Blair, offer the munificent sum of $500.

Where "Old Style" May be Found.

The N. & G. Taylor Co., have established agencies in this city, in Portland, Oregon, Los Angeles and in Seattle, W. T. By a reference to their ad on page 2 of cover, the address of each will be found. The "Old Style" of tin plate is being extensively used all over the coast.

It is better to oil floors than to paint them—a monthly rubbing will make them as good as new.

CITY BUILDING NEWS.

Avery, between Geary and Post. Owner, Jane Broudero; architect, G. M. Saulsbury; contractor, G. M. Salsbury; cost, 1,950; signed, April 22; filed, April 23; sureties, D. Dodge and A. J. Gendavi; limit, August 1, '89; $650, windows in; $650, completed; $650, 35 days.

Army, corner San Jose Ave., cottage. Owner, F. Kaufmann; architects, Townsend & Wyneken; contractors, Gray & Stover; cost, $8,360; signed, April 8; filed, April 17; limit, July 15, '89; $3,135, ready to lath; $3,135, inside work done; $2,090, 35 days.

Albion Ave., near Sixteenth, three-story frame. Owner, Marie Schath et al.; architect, A. J. Barnett; contractor, Wm. Linden; cost, $4,375; signed, April 27; filed, May 1; sureties, W. A. Meeker, $2,500; limit, 100 days; $900, roofed; $800, brown coated; $800, white coated; $775, completed; $1,100, thirty-five days.

Buchanan near Union, two story frame. Owner, P. Johnson; contractor, McGinnes; cost, $4,000.

Buchanan near Turk, three story frame. Owner, Samuel Wilson; architect, Alex. R. Pfarrer; contractor, B. Pfaffer; cost, $5,850; signed, April 26; filed, April 27; $1,450, framed; $1,400, brown coated; $1,500, completed; $1,500, 35 days.

Broadway and Buchanan. Owner, Mary G. O'Kane; architect, Sam'l Newsom; contractors, Anderson Bros.; cost, $8,075; signed, April 27; filed, April 27; surety, J. Kennedy, $3,000; $1,211.25, framed; $1,211.25, roof on; $1,211.25, white mortared; $1,211.25, outside primed; $1,211.25, completed; $2,018.75, 35 days.

Broderick and Eddy, two two-story and basement frame. Owner, Isabel Durney; architect, R. H. White; contractor, D. H. Matherson; cost, $4,750; signed, April 29; filed, May 2; sureties, Preston and McKinnon, $4,000; limit, 90 days; $890, chimneys built; $890, brown coated; $890, outside primed; $890, completed; $1,190, 35 days.

Buchanan corner O'Farrell, plumbing, etc. Owner, Robt. Lorentz; architect, W. Winterhalter; contractors, Thos. Clark & Sons; cost, $768; signed, April 5, filed, April 8; $300 Inspector's certificate shown; $468 completed.

Bush corner Sansome, Hydraulic elevator. Owner, First National Bank, S. F.; architects, Wright & Saunders; contractors, W. H. Birch & Co.; cost, $4,525; signed, March 28; filed, April 9; limit, June 28, 1889; 75 per cent. in installments on the first of each month as work progresses; balance, 25 per cent. 35 days.

Broadway and Taylor, move old and build new house. Owner, F. A. Lasell; contractor, Geo. M. Salsbury; cost, $2,946; filed, May 3; limit, August 1, '89; $200, old house removed; $746, framed; $700, brown coated; $1,300, August 3, '89.

Buchanan, between Union and Filbert, one story cottage. Owner, Leopold Bauer; architect, Wm. Schrof; contractor, S. G. Rienacker; cost, $1,780; signed, May 3; filed, May 3; surety, Jacob Hoeges; limit, July 4, '89; $440, roof boards on; $440, brown coated; $440, first coat paint on; $160, completed; balance when receipts for labor are shown.

Block bounded by Vienna and Naples streets, and Russia and France avenues. cottage. Owner, Wm. G. Loewe; architect, Emil John; contractor, Adam Miller; cost, $2,500; signed, May 1; filed, May 1; limit, July 1, 1889; $875, rough mortared; $1,000, accepted; $625, thirty-five days.

Clay corner Buchanan, six two story frames. Owner and builder, Wm. Hinkle; cost, $30.000.

California Avenue near Powell Avenue, two story frame. Owner and builder, Frichette; cost, $3,500.

Clementina and Fourth, alterations. Owner, Wm. Gaffney; architect, M. J. Welsh; contractor, J. O'Connell; cost, $2,150; signed, April 8; filed, April 18; $500, framed; $600, first coat mortar on; $500 completed; $550, 35 days.

Clementina, between First and Second, brick building. Owner, Dickman, Jones Co.; architects, Pissis & Moore; contractors, Riley & Loane; cost, $8,300; signed, April 18; filed, April 20; $2,000, ready for second story joists; $2,000, ready for roof timbers; $2,000 completed; $2,300, 35 days.

Castro and Sixteenth, two story building; Owner, Mrs. F. J. Andrews; contractor and architect, Albert Cooke; cost, $3,800; signed, April 4; filed, April 9, 75 per cent. of work done as work progresses; balance, 25 per cent. 35 days.

1418 California, additions, etc. Owner, Wm. M. Dye; architects, J. J. & T. D. Newsom; contractors, Moore Bros.; cost, $3,150; signed, April 3; filed, April 10; limit, 90 days; $1,000, roof work up; $681, mortar on; $681, completed; $788, 35 days.

Diamond and Nineteenth, to build. Owner, J. C. Kent; architect, S. Hatfield; contractor, A. A. Willis; cost, $2,150; signed, April 13; filed, April 25; limit, 60 days; $412.50, roof boards on; $400, window frames in; $400, plastering done; $400, completed; $537.50, 35 days.

Derisadero corner Sutter, to build. Owner, J. Murray; architects, Copeland & Banks; contractor, G. Healing; cost, $4,216; signed, April 13; filed April 16; sureties, J. Healing and G. Shankland; limit, 100 days; $400, old building completed; $900 framed; $1,000, brown coated; $862 completed; $1,054, 35 days.

Dolores, between Twenty-third and Twenty-fourth, three two story flats. Owner, Mrs. M. A. Smith; architects, Percy & Hamilton; contractor, F. W. Kern; cost, $11,702; signed, April 9; filed, April 18; Sureties, O. W. Nordwell and F. Joost, $5,000; 75 per cent. of work done on first Saturday of each month; balance, 35 days.

Dolores and Liberty, two story dwelling. Owner, Edgar W. Briggs; architect, S. Hatfield; contractor, Jos. W. Reid; cost, $2,230; signed, March 4; filed, April 10; sureties, J. Macowsky and Adolph Schwerin, $1,500; $500, roof boards on; $390, floors laid; $390, yard done; $392.50, completed; $557.50, 35 days.

Eighteenth corner Sanchez, two story frame. Owner, Henry Tietjen; architect, H. Geilfuss; contractor, Schutt & Krecker; cost, $8,410; signed, April 27; filed, April 27; $1,260, framed; $1,260, partitions set; $1,260, outside work done; $1,260 outside finith on; $1,260, completed, $2,110, 35 days.

Ellis, between Fillmore and Steiner, carpenter work. Owners, Main & Winchester; architect, Chas. Geddes; contractor, J. T. Grant; cost, $17,365; signed, April 17; filed, April 20; surety, C. Hanson; limit, 4 months and 10 days; $3,000, frame up; $3,024, ready for plastering; $3,500, all finish on; $3,500 completed; $4,341, 35 days.

Ellis, between Fillmore and Steiner, painting. Owners, Main & Winchester; architect, C. Geddes; contractor, Thos. Downing; cost, $1,380; signed April 17; filed, April 20; surety, L. Hartter; August 20, '89; $450 ready for graining; $485, completed; $345, 35 days.

Ellis, between Fillmore and Steiner, plumbing. Owners, Main & Winchester; architect, C. Geddes; contractor, R. A. Vance; cost, $1,500; signed, April 17; filed, April 20; surety, G. R. Lang; limit, August 1, '89; $500, sewerage; $400, sewers connected; $225, completed; $375, 35 days.

Erie near Mission, three two story frames. Owner, Wm. Ede; architect, A. J. Barnett; contractor, O. E. White; cost, $6,500.

Fifteenth and Castro, to build. Owner, C. Lynch; architect, M. J. Welsh; contractors, Grant & Hopkins; cost, $3,375; signed, April 23; filed, April 25; $843.75, framed; $843,75, brown coated; $843.75, completed; $843;75, 35 days.

Folsom corner Juniper Avenue, plumbing, etc. Owner, Charles Bogan; architect, Jas. P. Chadwick; contractor, H. Williamson; cost, $1,145; signed, April 3; filed, April 29; limit, July 15, '89; at end of each month 75 per cent. of work done, paid; balance when completed.

Folsom corner Juniper Avenue, carpenter work, etc. Owner, Charles Bogan; architect, J. A. Chadwick; contractor, G. H. Walker; cost, $9,200; signed, April 3; filed, April 29; sureties, Irvine Graham and Casper Dix, $2,500; limit, July 15, '89; $1,840 framed; $1,840, roofed; $1,840, brown coated; $1,840, first coat paint on; $1,840, completed.

Fulsom corner Juniper Avenue, brick work. Owner, C. Bogan; architect; J. P. Chadwick; contractor, R. Ringrose; cost, $1,245; signed, April 3; filed, April 29; limit, July 15, '89; 75 per cent paid at end of each week of work done; balance when completed.

Front corner California, excavations, pile driving, etc. Owner, M. Rosenbaum; architects, Salfield & Kohlburg; contractors, B. McMahon & Son; cost, $27.50 per pile; signed, April 25; filed, May 3; Sureties, C. S. Holmes and W. J. Adams, $5.000; limit, 45 days; payment made when completed and accepted.

Fulton, corner Fillmore, two story frame. Owner, Henry Hume; architect, R. Zimmerman; contractor, F. Weinoehl; cost, $3,945; signed, April 8; filed, April 15; $1,000, framed; $960, rough plastered; $1,000, accepted; $985, 35 days.

Fremont and Folsom, frame. Owner, F. A. Robins; architects, Pissis & Moore; contractor, S. C. Buzzell; cost, $5,418; signed, April 13; filed, April 17; $1,000, brick work done; $1,000, framed; $1,000 enclosed; $1,063, completed; $1,355, 35 days.

Fillmore and Pacific, dwelling. Owner, Isabella Mayers; architect, Samuel Newsom; contractor, W. H. Wickersham; cost, $5,285; signed, April 16; filed, April 19; surety, C. S. Holmes, $2,000; 75 per cent of work done on first of each month; balance, 35 days.

Green, near Buchanan, one story frame. Owner, Augusta G. Crosby; architect, W. H. Wharff; contractors, Farrell & Bell; cost, $4,500.

Geary corner Kearny, ornamental iron work. Owner, M. H. DeYoung; arcnitects, Burnham & Root; contractors, Winslow Bros. Co.; cost, $13,150; signed, April 2; filed, April 16; 75 per cent. of work performed to be paid on 10th of each month.

Guerrero and Twenty-second, to build. Owner, Mary Fogarty; architect, M. J. Welsh; contractor, R. Parker; cost, $4,400; signed, April, 16; filed, April 17; $700, framed; $1,200, brown mortared; $1,250, completed; $1,250, 35 days.

Guerrero and Twenty-fourth, two story frame. Owner, B. H. Schenhoff; architect, A. J. Barnett; contractor, Timothy Sullivan; cost, $5,884; signed, April 16; filed, April 18; surety, B. Joost, $3,000; limit, 100 days; $1,213 roofed; $1,100, brown coated; $1,100, outside finish on; $1,471, 35 days.

Guerrero, between Seventeenth and Eighteenth, to build. Owner, Louis Schloh; architect, F. Koldenstrodt; contractors, Tegeler & Muller; cost, $5,800; signed, April 9, filed, April 9; limit, 3 months; $1,750, framed; $1,750, first coat plastering on; $1,800, completed; $500, 35 days.

Golden Gate Avenue, near Jones, freight elevator. Owner, Lizzie H. Moffatt; contractors, A. J. McNicolls & Co.; cost, $1,150; signed, April 9; filed, April 11.

Guerrero and Twenty-third, two story. Owner H. Minderman; architect, H. Geilfuss; contractors, Tegeler & Muller; cost, $3,785; signed, April 8; filed, April 13; $475, framed; $475 roofed; $475 partitions set; $475, outside work done; $475, inside work done; $460, completed; $950, 35 days.

Howard corner Fourteenth, two story building. Owner, Mrs. E. L. Miller; architect and contractor, M. Wm. Kain; cost, $5,000; signed, April 22; filed, April 25; limit, August 1, '89; $1,250, framed; $1,250, brown mortared; $1,250, white mortared; $1,250 finished.

Howard corner Fourteenth, two story frame. Owner, D. Sullivan; architects, Schmidt & Shea; contractor, J. F. Logan; cost, $8,493; signed, April 26; filed, April 27; sureties, B. Joost and W. Thyarks; limit, 90 days; $1,500, framed; $1,600, plumbing in; $1,600, outside primed; $1,600, completed; $2,193, 35 days.

Haight, between Steiner and Pierce. Owner, Aug. Kenerleber et al.; architect, R. Zimerman; contractor, Adam Miller; cost, $1,050; signed, April 26; filed, April 27; $300, rough mortared; $400 accepted; $260, together with last payment of contract.

Howard, corner Tenth, Hydraulic Ram Elevator. Owner, Omnibus Cable Co.; contractors, Cahill & Hall; cost, $4,275; signed, April 6; filed, April 8; limit, 60 days; one-half when work is completed; balance, 35 days.

Jackson near Fillmore, additions. Cost, $600.

Jackson corner Baker, additions. Owner, and builder, W. F. Lewis; cost, $2,000.

Jackson and Franklin, two story frame. Owner, J. C. Franks; architect, J. E. Krafft; contractor, J. H. McKay; cost, $8,275; signed, April 19; filed, April 23; sureties, Jno. F. Kennedy and Geo. T. Shaw, $4,000; limit, four months; $2,000, rafters on; $2,000, brown mortar on; $2,275, completed; $2,000, 35 days.

Jasper Place and Union street, three story frame. Owners, C. Rondinotto, et al.; architects, Townsend & Wyneken; contractor, O. E. White; cost, $5,253; signed, April 26; Filed, April 27; $1,200, roof boarded; $1,300, first mortar on; $1,438, sashing done; $1,315, 35 days.

Jackson, between Scott and Devisadero, frame. Owner, Jos K. Parker; architects, Pissis & Moore; contractor, Jas. Geary; cost, $5,320; signed, May 1; filed, May 1; sureties, W. A. Meeker, $2,500; $1,000, framed; $1,000, brown coated; $1,000, interior plastered; $990, completed; $1,330, thirty-five days.

Lyon and Geary, dwelling. Owner, Margaret S. Clapp; architect, J. Hatfield; contractors, Plumber & Martin; cost, $2,350; signed, April 23; filed, April 24; surety, Frederick Kalbfleisch, $1,500; $550, roof boards on; $404, first coat plaster on; $404, windows in; $404, completed; $587.50, 35 days.

Lapidge and Nineteenth, two-story frame. Owner, Thomas Gardner; architect, M. J. Welsh; contractor, J. O'Connel; cost, $2,000. signed, April 17; filed, April 25; $400, framed; $533.33⅓ brown mortared; $533.33⅓, completed; $533.33⅓, 35 days.

Leavenworth, near Pacific, building. Owner, John Devery et al.; architect, G. H. Miller; contractor, John Dyar; cost, $3,720; signed, May 2; filed, May 2; sureties, Joseph Peers and John Willis, $2,500; limit, ninety days; $600, rough frame up; $700, roof on; $700, white coated; $790, completed; $930, thirty-five days.

Mason and Sutter, three-story frame. Owner, Ellen L. Hayward; architects, C. R. & J. M. Wilson; contractor, Jas Geary; cost, $6,865; signed, April 22; filed, April 22; $1,025; second story joists on; $1,030, roof on, $1,030, brown coated; $1,030, white coated; $1,030, completed; $1,720, 35 days.

Mariposa corner Florida, building. Owner, G. S. Ashmead; architect, T. J. Welsh; contractor, B. Horn; cost, $6,800; signed, April 24; filed, April 27; sureties, T. Downing and E. M. Harmon, $4,000; limit, 90 days; $600, first story joists on; $675, framed; $1,275, brown coated; $1,275, white coated; $1,275, accepted; $1,700, 35 days.

Market, between Fourth and Fifth, concrete work. Owner, California Academy of Sciences; architects, Percy & Hamilton; contractors, Ransome & Cushing; cost, $14,300; signed, April 15; filed, April 20; sureties, E. G. Stetson and A. A. Wigmore, $7,000; 75 per cent. of work done to be paid on first Monday of each month; balance, 35 days.

Masonic Avenue and Geary, one story cottage. Owners Mr. and Mrs Shoop; architect, G. G. Gillespie; contractor, G. G. Gillespie; cost, $1,200; signed, April 2; filed, April 20; $225, framed; $225 brown mortared; $225, white mortared; $225, completed; $300, 35 days.

Market between Fourth and Fifth, carpenter work. Owner, California Academy of Sciences; architects, Percy & Hamilton; contractor, W. M. Fletcher; cost, $49,772; signed, April 9; filed April 20; sureties, F. Joost and J. F. Kennedy, $20,000; limit, 90 days; 75 per cent of work done to be paid on first Monday of each month; balance, 35 days.

Minna, corner Seventh, alterations, etc. Owner, M. Foley; architect, J. J. Clark; contractor, C. Quinn; cost, $3,000; signed, April 9; filed April 11; surety, John McGuire, $3,000; limit, 30 days; $1,000, one-half brick work done; $1,000 brick work completed; $1,000 35 days.

Market, between Fourth and Fifth, brick work. Owner, California Academy of Science; architects, Percy & Hamilton; contractor, John McCarthy; cost, $36,884; signed, April 2; filed, April 11; sureties, Willis E. Davis and Theo. W. Peterson, $12,000; limit, 200 days; 75 per cent. on first Monday in each month as work progresses; balance, 25 per cent. after completion.

Market, between Fourth and Fifth, granite work. Owner, California Academy of Sciences; architects, Percy & Hamilton; contractors, M. J. Healy & Co.; cost $17,200; signed, April 9; filed, April 20; sureties, Wm. Mathews and Wm. R. Morton, $10,000; limiit, 90 days; 75 per cent of work done to be paid on first Monday of each month; balance, 35 days.

Market, between Fourth and Fifth, wrought iron work. Owner, California Academy of Sciences; architects, Percy & Hamilton; contractors, Rix & Firth; cost, $12,375; signed, April 9; filed, April, 20; sureties, Howard Havens and Abner Doble, $5,000; Limit, 90 days; 75 per cent; of work done to be paid on first Monday of each month; balance, 35 days.

Market, between Fourth and Fifth, plumbing. Owner, California Academy of Science, architects, Percy & Hamilton; contractors. Duffy Bros.; cost, $15,326; signed, April 15; filed, April 20; sureties, J. Mahony and Robt; Mitchell, $7,000: 75 per cent of work done to be paid on first Monday of each month; balance, 35 days.

Market, between Fourth and Fifth, cast iron work. Owner, California Academy of Sciences; architects, Percy & Hamilton; contractors, O'Connell & Lewis; cost, $18,900; signed, April 9; filed, April 20; sureties, J. J. Mahony and Abner Doble, $10,000; limit, 60 days; 75 per cent of work done to be paid on first Monday of each month; balance, 35 days.

Nineteenth and Dolores, three story frame. Owners, Jules Wolf and wife; architects, Huerne & Everett; contractor, F. Buckley; cost, $4,800; signed, April 11; filed, April 13; $1,200, roof sheathed; $1,200, brown coated; $1,200, completed; $1,200, 35 days.

Noe and Fourteenth, two story. Owner, Kate W. Cook; architects, C. H. & J. M. Wilson; contractor, F. V. Aiken; cost, $3,360; signed, April 15; filed, April 20; $915, inclosed; $915, brown mortared; $915, completed; $915, 35 days.

Natoma, near Lafayette, to build. Owner, Margaret McCormack; architect, C. V. Pierce; contractor, C. Peterson; cost, $3,425; signed, April 29; filed, May 1; sureties, F. P. Latson and A. W. Starbird; limit, ninety days; $856.25, roof on; $856.25, outside finish on; $856.25, completed; $856.25, thirty-five days.

Ninth corner Stevenson, additions. Owner, R. Flaherty; architects, B. McDougall & Son; contractor, J. H. McKay; cost, $5,470; signed, April 6, filed, April 8; sureties, J. F. Kennedy and L. B. Doe, $3,600; limit, June 30, '89; $750, chimneys to top of walls; $900, chimneys toped out; $1,100 brown coated; $1,320 completed; $1,400 36 days.

Oak and Laguna, to build. Owner, Mrs. H. K. Barr; architect, T. J. Welsh; contractor, M. J. Gorman; cost, $5,098; signed, April 15; filed, April 16; sureties, Duffy Bros. and J. Mahony, $2,500; $1,232, studding up; $1,232, brown coated; $1,234, completed; $1,400, 35 days.

Octavia corner Sutter, four story frame. Owner, James G. Fair; architects, Schultze & Meeker; contractor, J. T. Grant; cost, $39,339; signed, April 16; filed, April 17, sureties, C. Hanson and W. J. Adams; $13,000; limit, November 1, '89; 75 per cent. on first of each month as work progresses; balance, 35 days.

Octavia near Vallejo, three frame dwellings. Owner and builder, W. F. Lewis; cost of each, respectively, is $4,500, $6,500, $4,000; total, $15,000.

Prospect Avenue, corner Powell Avenue, three one story frames. Owner and builder, F. Nelson; cost, $5,000.

Pacific, between Jones and Leavenworth, three story frame. Owner, Herman Wrede; architect, Emil John; contractor, S. Wray; cost, $4,592; signed, April 22; filed, April 23; limit, August 1, '89; $800, framed; $800, partitious set; $800, outside finished; $1,044, accepted; $1,148, 35 days.

Pennsylvania Ave., between Solano and Butte, two story flat. Owner, Thos. Murphy; architects, Schmidt & Shea; contractor, G. I. Doering; cost, $2,700; signed, April 9, filed, April 22; surety, J. Ahlbach; limit, 65 days from May 13; $500, enclosed; $500, brown coated; $500, hard finished; $500, completed; $700, 35 days.

Polk near Sacramento, additions; cost, $800.

Pine corner Touchard, two story dwelling. Owner, M. P. Jones; architect, Wm. J. Mathews; contractors, Maloney & Shay; cost, $10,297; signed, April 15; filed, April 19; limit, October 1, '89; 75 per cent to be paid as work progresses; balance, 35 days.

Stewart and Market, artificial stone sidewalks. Owner, Gualala Mill Co.; architect, C. I. Havens; contractors, Gray Bros.; cost, $1,502; signed, April 22; filed, April 23; $700, work in basement finished; $802, completed.

Rhode Island corner Yolo, one story. Owner, J. Barduhn; architect, J. T. Hogan; contractor, J. W. Mader; cost, $1,360; signed, April 17; filed, April 19; limit, June 5, '80; $250, framed; $260, rough plumbing done; $255, hard finished; $255, completed; $340, 35 days.

Seventeenth and Dolores, two story frame. Owner, P. J. Dwyer; architect, M. J. Welsh; contractor, R. Parker; cost, $3,550; signed, April 8; filed, April 10; $887.50, framed; $887.50, brown coated; $887.50, completed; $887.50, 35 days.

Sutter, Lots 1526 and 1528, retaining walls. Owner, M. S. Lowenthal; architect, Fred E. Wilcox; contractor, John Kelso; cost, $4,094; signed, April 11; filed, April 11; limit, 30 days; $3,070.50, completed; $1,023.50, 35 days.

Sacramento, corner Scott, two story frame. Owner, Jas. M. Wright; architect, W. F. Lewis; contractor, Wm. F. Lewis; cost, $6,400; signed, March 9, filed, April 15; limit, July 19, '89; $5,000 to be paid during progress of building, and $1,400 when completed.

Sutter, near Scott, build complete. Owner, Joseph Hauxmann; architect, G. H. Miller; contractor, Jas. Geary; cost, $2,755; signed, May 1; filed, May 4; sureties, C. S. Holmes and Thos. Richardson, $2,000; limit, ninety days; $600, framed; $500, plumbing done; $500, primed; $466, completed, $689, thirty-five days.

Seventeenth Avenue corner N, ten one story frames. Owner, J. Twist; architect and builder, W. F. Lewis; cost, $8,500.

Sansome and Halleck, alterations. Contractor, Haneke; cost, $2,500.

Tenth corner Stevenson, two story and basement frame. Owner, P. Brady; day work; cost, $7,000.

Twenty-Sixth, between Mission and Howard, two frames. Owner, G. F. Dallinge; architect, J. Trownson; contractor, S. C. Kronnick; cost, $3,700; signed, April 16; filed, April 16; limit, 90 days; $3,700, to be paid when building is completed.

Twelfth and Howard, to build. Owner, Daniel O'Connor; architect, M. J. Welsh; contractor, M. J. Scott; cost, $3,350; signed, April 17; filed, April 18; $837.50, framed; $837.50, brown coated; $837.50, completed; $837.50, 35 days.

Twenty-First, near Guerrero, two-story frame. Owner, Amandus F. Schumacher; architect, C. I. Havens; contractor, C. E. Dunshee; cost, $5,290; signed, May 2; filed, May 4; $900 inclosed; $1,000, pipes in; $1,000, hard finish on; $1,000, completed; $1,390, thirty-five days.

Thirtieth corner Church, alterations, etc. Owner, Geo. H. H. Patterson; architect, E. C. Warden; cost, $2,500; signed, April 27; filed, May 1; $600, hall partitioned off; $600, brown mortar on; $700, completed; $600, 35 days.

Third, corner Stevenson, brick work. Owner, C. H. Ackerson; architects, Schmidt & Shea; contractors, Peacock & Butcher; cost, $7,250; signed, April 8; filed, April 8; $3,500 ready for roofing; $1,800, completed; $1,950, 35 days.

SANDSTONE.

Arizona Red and Pink Sandstone, which for strength and uniformity of color cannot be excelled, can be furnished in quantity and sizes to suit.

Prices reasonable.

Twenty-fourth, corner Shotwell, two story frame. Cost, $1,200.

Tilden and Castro, two story flat. Owner, J. V. DeLaveaga; architects, Schmidt & Shea; contractors, R. Doyle & Son; cost, $3,874; signed, April 22; filed, April 24; sureties, R. McCann and J. McCarthy; limit, 90 days; $725, enclosed; $725, plumbing in; $725, outside primed; $725, completed; $974, 35 days.

Thirteenth and Folsom, three story frame. Owner, Mrs. D. E. Keeks; architect, M. J. Welsh; contractor, Jas. Finn; cost, $3,780; sighed, April 3; filed, April 10; $945, framed; $945, brown coated; $945 completed; $945, 35 days.

Van Ness Avenue, corner Geary, additions. Owner, Sam Hart; architects, Schmidt & Shea; contractor, Wm. Pluns; cost, $16,250; signed, April 10; filed, April 12; sureties, F. Joost and D. Woerner; limit, 90 days, $5,000, enclosed; $3,000, brown coated; $3,000, hard finished; $3,000, completed; $4,250, 35 days.

Valencia, and Twenty-fifth; to build complete. Owner, John Dreamer; architect, M. J. Welsh; contractor, M. C. Lynch; cost, $4,250; signed, April 26; filed, May 3; $1,000, framed; $1,000, brown mortared; $1,000, completed; $1,250, thirty-five days.

COUNTRY BUILDING NEWS.

OAKLAND.

The average cost of the new dwelling houses now building in Oakland is much greater than in former years. In 1876 the average cost of some 900 houses erected was $870. In 1877, 655 houses were built, averaging about $950 each. This was the period of small, illy constructed, cheap dwellings, without modern conveniences, and built without reference to sanitary regulations, which did not exist officially at that time. Each succeeding year has shown a higher average in cost and more artistic architecture, until at the present time a gratifying showing can be made. The fifty-four new dwellings noticed in this semi-monthly TRIBUNE report are building at a cost of $146,400, an average of $2,710 each. In all cases the figures given have been obtained from the owner, contractor, or agent, and represent the contract price, not including extras.

The number of buildings detailed in the report embracing the latter half of March is fifty-four; cost, $146,400. Previously reported since January 1st, 165, cost, $524,600. Aggregate to March 31st, 219; cost, $671,000.

Under the heading of "Oakland Enterprise Abroad" THE TRIBUNE has often had occasion to mention the achievements of our local builders, but until now the pleasure of announcing the fact that an Oakland firm is building an entire town has not been accorded. El Verano is the first town to be built on its pristine development entirely by Oakland enterprise. A handsome business block of brick costing $10,000, a store, a restaurant and twenty-five dwellings, all supplied with modern conveniences, are in course of construction for the Sonoma Valley Improvement Co. at El Verano by A. W. Pattiani & Co., who are pushing the work as fast as possible. When it becomes known that Oakland builders are doing the lion's share of work for the interior, our planing mills, hardware stores, and all branches of trade concomitant with building enterprises, will flourish in a manner that cannot fail to gratify our local pride as well as add to the wealth of the city.

L. Dresco is building a six-room cottage on the south side of Eighteenth street, between Castro and Brush, at a cost of $2,000. H. Adams is the contractor.

E. Hook has commenced a first-class modern residence of eight rooms on the southeast corner of Eleventh and Jackson streets, to cost $4,000. W. N. Concannon is the contractor.

We particularly note that people seem to be inclined to build better houses and leave behind the cheap style of improvement, recognizing the fact that Oakland must become a great city, and that it must be built up with a view to a grand future and its requiremenrs in regard to stability of structure, combined with beauty and good taste.

Sanitary Inspector Snook says that requirements for inspection of new premises is much greater than ever before, and that the class of work going on is superior to that of former years, beyond comparison.

Among the more prominent buildings shortly to be commenced are the Unitarian Church edifice, which will rank among the best of the many fine church buildings of Oakland. The Young Men's Christian Associafion building, to cost $30,000 to $40,000, and a large and costly business block by J. W. Mackay. the only survivor of the bonanza kings.

BENICIA IMPROVEMENTS.

Our old friend. the *New Era* sends us the following as a summary of improvements in and around Benicia.

Bank of Vacaville, cost	- - - - -	$ 3,700
Hotel at Elmira	" - - - - -	7,000
" " Suisun	" - - - - -	17,500
Residence of J. Cohn, Suisun	- - -	2,500
" of A. W. Howe, Benicia	-	1,800
" of J. L. Innes, "	-	1,650
" of J. A. Smith "	-	1,800
" of G. R. Duval, "	-	2,000
" of T. B. Montgomery "	-	4,000

The Benicia Planing mill is doing most of the above. J. B. McKenzie is the owner. S. Brooks is foreman. O. H. Butler attends to the brickwork. L. K. Risley the plastering. Beardslee & Johnson the painting.

SAN JOSE.

FROM OUR SPECIAL CORRESPONDENT.

Two two story frame dwellings, Fifth near San Salvador street. Mrs. Steiger, owner; J. Lenzen & Son, architects; F. Davis, contractor; cost, $5,200.

Two story frame dwelling, San Carlos near Fourth street. Mrs. Auzerais, owner; Theo. Lenzen, architect; R. Summers, contractor; cost, $6,000.

Two story frame dwelling, corner Fourth and Empire streets. L. Auzerais, owner; Theo; Lenzen, architect; J. D. Stewart, contractor. cost, $5,500.

One story cottage, Delmas avenue, B. Campen, owner; Shottenhamer, contractor; cost, $1,600.

Cottage on San Carlos street. E. L. Ford, owner; Keast, contractor; cost, $2,000.

Two story dwelling, San Carlos near Delmas avenue Mr. Ouer, owner; Shotenhamer, contractor; cost, $2,100.

One story cottage, San Fernando near the Guadulupe. Mrs. Penchard, owner; J. Lenzen & Son, architects; A. C. Bates, contractor; cost, $2,800.

Two story dwelling, Willow street. Mr. Theurkauf, owner; Theo. Lentz, architect; cost, $7,000.

Two story dwelling near junction of First and Second. Mr. Becker, owner; J. Lenzen & Son, architects; cost, $4,000.

Two story dwelling, Vine and Park avenues. Otto Ziegler, owner; Theo. Lenzen, architect; cost, $3,800.

ALAMEDA.

Mr. Capp is having a six-room cottage built by Contractor Hamilton on the property lately purchased by him at the corner of Pacific avenue and Chestnut street. As soon as the plastering is finished he will commence the erection of a similar building next to it. Each of the houses will cost about $3,500.

SANTA ROSA.

Vandle & Glynn are about to erect a large machine shop.

A. C. Means is building an addition to his school house.

COLFAX.

It is understood that a large hotel will be erected at this place. The owner is Mrs. M. J. Lawrence of Downieville.

SACRAMENTO.

The Capitol Hotel will be reconstructed on first floor. Stores will be fitted up at a cost of $8,000. E. A. Bovyer superintends the alterations.

SAN RAFAEL.

A club house will be erected in connection with Hotel Rafael at a cost of $7,500. Curlett & Cuthbertson are the architects, and J. Blake the contractor.

LOS ANGELES.

N. W. Stowell has accepted plans for a $25,000 building to be erected on Spring street.

SAN FRANCISCO, JUNE 15, 1889.

AN architect's suit was recently decided in the Supreme Court of Massachusetts—according to the *American Architect*—which has a certain interest. The architect of a hotel in Boston sued the owner for something over $25,000 for services in preparing plans and superintendence of the building. The defendants claimed that the architect agreed to render the necessary services for three and one-half per cent. on the cost of the building. This was $414,000, so that his commission amounted to $14,000, of which they had paid him $8,000, and were ready to pay the balance. The architect admitted the agreement to accept three and one-half per cent commission, but claimed additional compensation for extra services, etc. Evidence was brought as to the skill and reputation of the architect, and the auditor who first heard the case awarded him about $8,500. The case was again tried before a jury, which brought in a verdict for $13,000 for the architect. This, added to the $8,000 previously received on account, is about five per cent. on the total cost of the building, so that the jury seems to have taken the view that five per cent. on the cost is about what the architect ought to have for such work, and that if he was foolish enough not to come to a clear understanding with his clients, in the first place, about what he was to do and what he was to be paid for doing it, he deserved to lose the small compensation which he might have earned by extra work.

IS it not about time for our architects to seriously consider the necessity of appointing a "Clerk of Works," the salary of the same to be paid by the owner. This city is rapidly growing and to properly superintend a house in course of construction way out on Pacific or Sunset Hights, really requires more time than is warranted by the usual fee of 5 per cent.

Subscription price of this Journal is $2 00 per year. Examine the Contents of this Issue and see if it is not worthy of your support.

RECENT law cases make it very evident, that architects are made the butt of some people who would put them to any amount of trouble and expense, without offering to remunerate them; why the impression should have got about as it has done, that these gentlemen will design buildings for the pleasure of doing the work and that payment of fees is only conditional upon its suiting the convenience of the client to to go on with the building, it is hard to say, but some of our most influential public companies and associations have set such an example and the terms of competition are assuming less favorable form.

WE commence with this issue a series of Artotypes of lately completed buildings. For richness of design, the one in the present issue will compare favorably with those printed in any other journal in the country.

THE Legislature of the State of Texas has passed a law requiring all architects to obtain a certificate before being allowed to practice their profession. Architects from other States who have been in the habit of preparing plans for clients in Texas, will do well to heed one of the rules laid down, viz., that persons practicing without a certificate should be denied the assistance of the courts in collecting payment for their services. We know architects in this State who have prepared plans for acceptance in the State named, and in future they must bear the above regulations in mind.

IT is about time that the Chapter of Architects, and all kindred associations, protest vigorously against another abuse that has gradually been growing on this coast. We refer to the fact that the supervision of the building work must not be placed in the hands of any other than the successful competitor.

WHY are the "good old times" of our forefathers being revived in the "new-fangled notions" that are now being used in the furnishing of houses of the present day? Look at pictures of the hallways as designed centuries ago and compare them with those of to-day. We find the same roomy landings where one can rest before finishing the flight; the large open fire-place, with its garniture of brass andirons, etc.; the old corner clock—all these revived in the hallways of to-day. Is the architecture of our forefathers to be revived in the present generation, and are we to come to the conclusion that, after all, the styles of those of the long ago were not only superior in general arrangement, but were also more conducive to health?

THE recent offer of a neighboring territory to pay $500 for the *best plan* for a $3,000,000 Capitol building, is one that should not be regarded by any member of the architectural profession on the Pacific slope.

A PROMINENT architect in Los Angeles addressed a communication to the Chapter of Architects in this city in regard to the establishing of a branch of the Western Association of Architects on this Coast. This journal would like to see all the various architectural associations united in one grand organization, with branches of the same in every prominent city.

WE notice that the California style of framing dwellings is being generally adopted through the eastern states. At first, such framing was done as a matter of expediency, but a test of over forty years proves it fully equal in lasting qualities to the old-fashioned mortise and tenon.

Plastering and Stucco Work.

Paper read by James John, Esq., before the National Association of Builders.

Mr. President and Gentlemen of the Convention—It has been my privilege to be selected to read you a brief paper on the subject of Plastering and Stucco Work. I have seen fit to diverge to a slight extent from the text as laid down by endeavoring to embrace the whole matter in the word "plaster." I will therefore read you what I have, with the idea that plaster will comprehend the whole of it.

It has been the fate of this simple, durable, and inexpensive material to escape the assaults which every good thing in this world must encounter at one time or at another. It has been called unclean, but it is not so of itself. Like many another wholesome and useful medium, it can be so ill-made and be so indifferently applied as to offer to dirt and insects abiding-places, due to the perverted ingenuity of man, not to any inherent defects of itself. In spite of all that has been said against it, it remains the universal lining for dwellings throughout the civilized world. Wealth may incase walls and ceilings in decorative woods and metals, but for the mass of mankind plaster must continue to be the simplest, cleanest, least costly, and most enduring finish for homes. The health of the vast majority of mankind is therefore largely dependent upon the materials used in its mixture and the manner of application.

It is undeniable that the custom that obtained some years ago of applying plaster into highly ornate designs was, for domestic purposes, unsanitary. The foliated, convoluted, and otherwise multiform designs which used to be spread out upon ceilings, in cornices, or special pieces are gradually passing out of use. Their innumerable crevices served only as receptacles of dirt in which the deposits were continuous.

The ornamental uses of plaster having been reduced by good sense and good taste, it remains still the most vigorous, as it is the oldest, vehicle for carrying down to generation after generation the masterpieces of art with which the golden age of sculpture enriched the human race. Humble as its components are, common and cheap as it seems besides marble, and paltry when compared with the metals that have to a considerable degree taken its place for reproductive uses, it *still* preserves the plastic art, and enables youth to contemplate antiquity in its noblest achievements. To-day plaster is revolutionizing industrial art; for us, and, in all probability, for those who are to come after us, plaster, lowly and cheap, but docile and durable, is the connecting agent with this greatest of men's indorsements in the past.

Plaster thus employed in duplicating great works of marble, iron, and bronze is to-day extending the finest industries, modern and ancient. The erection of the new museums in England, near the great manufacturing centres, would be next to useless were not plaster available for distributing fac-similes of the works, whose grandeur has made the name of Greece imperishable, and whose usefulness in development and the study of form, for all arts, is acknowledged to be unequalled. So potent is this simple medium, therefore, that it serves to-day as effectually as marble itself for the perpetuation of fine art; and by its endless variations of models, copied from every other material known in history, it is the supreme teacher of design. The reproduction of classic works at Kensington, and their dissemination throughout the provinces of the United Kingdom, have had the effect of making France fear for her supremacy in fine industrial productions. The important part that plaster thus plays in the Old World it will continue to play in the New. Wherever art places its altar, plaster will be there as its handmaid; and, though it may be abused by carelessness and calumniated by more pretentious rivals, it must remain the most faithful friend of progress in taste, science, decoration, usefulness, and economy.

Noble and varied as may be the uses to which plaster has and may be applied, I regret to say that the art of applying the same as an avocation for the lining of dwellings is to-day so remunerative to the artisan that it *almost* ceases to enlist the skill and intelligence that the art should command. This is due mainly to the want of appreciation by the architect and owner, whose only thoughts are for a semblance, for the time being, and are tempted by the questionable economy of saving a few dollars into letting contracts to men of no mechanical standing. It is hoped and expected that through the influence of the National Association of Builders and the intercourse its executive officers may have with the reputable architects of the country, the day is not far distant when it will be required of the artisan in the various branches pertaining to buildings to arm himself with a proper and authoritative testimonial giving proof that he *is skilled* in his art, and thus separate the wheat from the chaff, the former be recognized and the latter find its level.

It is a well-known fact that plaster on a ceiling surface in the event of fire will detain it for a long time, *providing* any means have been taken *when* applied to secure it under such circumstances, and, were these means more generally employed, *millions* of dollars would be saved to this country annually.

As the fire-proof construction is the exception, and as wood construction must predominate for years to come, therefore attention should be given to make the latter structure more fire-resisting.

During the last twenty years I have devoted much thought to this subject, and some of the devices I have had in that direction I have sought to secure by letters patent, and strange to say, came in conflict with an English patent in the archives at Washington bearing date 1797. The device then discovered has been slumbering there nearly one hundred years, and *to day* I know of nothing *more economical or effectual* to secure plaster in position in the event of fire than the same device. It is simply a wire netting, as used to-day for a foundation, but, as there described, placed over the bottom surface of the plaster and then securely stapled to the furring or joists, and afterwards the finishing coat of plaster applied over the surface. And as most every mechanic has at some time or other taken out a patent or applied for one, it may be interesting to you to hear the language that Edmund Cartright (as that was the name of the applicant) used in paying due deference to his Soverign Lord.

After describing his invention in substantially the same language that obtains in patents of the present day, he closes thus:—

"In witness whereof, I, the said Edmund Cartright have hereunto set my hand and seal this eight day of November in the thirty-eighth year of the reign of our Sovereign Lord George the Third by the grace of God, of Great Britain, France and Ireland, King, Defender of the Faith, and so forth, and in the year of our Lord One Thousand Seven Hundred and Ninety Seven."

"EDMUND CARTRIGHT."

Expansion of Timber due to the Absorption of Water.

BY PROF. DE VOLSON WOOD.

It is stated by some writers upon the properties of building materials that timber shrinks but little in the direction of its fibers from being thoroughly dried, or expands but little in the same direction from the adsorption of moisture; but the amount of these changes was not given in any work that I examined. Desiring to get some definite knowledge upon this subject, I caused to be prepared some pieces of pine, oak, and chestnut. The pieces selected were from lumber fairly seasoned, and were afterwards kept in a dry room for three weeks before any measurments were made. The pieces were straight-grained, free from knots or other defects.

In order to secure accurate measurements, brass pins were driven near the edges and ends, opposite to each other, and a fine mark made in each. The measurements were made to the nearest half-hundredth of an inch. The pieces were about five-eights of an inch thick, thirty-six inches long, and five and one-eighth inches wide.

After the first measurements were made, the pieces were put into a vessel of water and allowed to remain there thirty-seven days, at the end of which time they were measured again. The measurements were made on one side only. The following are the mean of the results:

Specimen.	Pine.	Oak.	Chestnut.
Initial length, inches	35.505	35.572	35.582
Final length, "	35.622	35.602	35.640
Elongation, "	0.017	0.030	0.058
Per cent of elongation	0.05	0.085	0.16
TRANSVERSE MEASUREMENTS.			
Initial width, inches	4.470	4.464	4.481
Final " "	4.586	4.620	4.645
Expansion, "	0.116	0.156	0.164
Per cent of expansion	2.6	3.5	3.6
Rate of lateral expansion / Rate of elongation	= 53	41	22½

It will be seen that the chestnut expanded laterally and longitudinally more than the oak or pine, that the rate of longitudinal, expansion was about three times that of the pine, and the lateral expansion was about one and four-tenths that of the pine. The expansion in the direction of the fibers was larger than I antiicipated, especially in the oak and chestnut.—*Scientific American.*

Semi-Annual Summary of Building Operations.

The present season has been a most prosperous one among architects and builders. In order that a full comparison may bo made with former years, we present in full the building operations for the first six months of the year:

Month.	Brick	Value	Frame	Value	Alterations	Value	Total	Value .....
January	4	$131,000	64	$420,200	16	$93,500	84	$420,200
February	9	832,000	49	218,600	13	26,900	71	1,077,500
March	4	63,000	69	287,000	10	26,900	83	376,900
April	4	128,000	82	357,400	11	51,200	97	536,600
May	3	190,000	85	405,300	11	45,450	99	640,750
June	2	47,500	87	527,200	23	59,500	112	634,200
Totals	26	$1,391,500	436	$2,215,700	84	$303,400	546	$3,910,600

In comparison with the record of former years for the first six months of the year, the summary is as follows:

1885—754	building engagements ..... value	$4,267,375
1886—670	" " ..... "	2,486,633
1887—516	" " ..... "	3,269,914
1888—437	" " ..... "	2,719,820
1889—546	" " ..... "	3,910,600

Academy of Architecture.

California is, as yet, too young a state to have an academy where architecture and building can be taught in all the various branches. In order that our young men may possess themselves of information in regard to the above named studies, they must need look to the older and more populous states. The nearest academy which, at present, we can call to mind, is situated in St. Louis, Mo., H. Maack being the Principal.

If anyone is engaged in a building trade, wants to prepare himself technically to fill a position above his fellow-workmen in the shortest possible time and for the least amount of money, then he should immediately enter this institute.

A skillful master-builder is expected to be master of not only his *own* trade, but should have sufficient knowledge of all the other building trades to enable him to judge justly of their requirements and to arrange their work to the best advantage.

As this is essential in working out plans and estimates of new buildings, as well as of repairs, and for appraising buildings already erected, it follows that it is necessary for the scholar to participate in the instruction in *all* the branches taken up in the respective classes, but the trade to which the scholar belongs may receive particular consideration.

A full course in this institute will consist of three terms of twelve weeks each, the regular winter course commences on the first Monday in December and closes at the end of February. But for those that want to complete their study without interruption, a special course will be opened both in September and March.

Address the Principal for further information at his academy, 3066 Ninth street, St. Louis.

Painting Wood.

One coat of paint takes twenty pounds of lead and four gallons of oil per one hundred square yards; the second coat forty pounds of lead and four gallons of oil; the third, the same as the second—say one hundred pounds lead and sixteen gallons of oil per one hundred square yards for three coats.

One gallon of priming color covers		50	square yards.

Our "Artotype."

The building which we illustrate in this number is the new mansion of Mr. and Mrs. W. H. Crocker, on the corner of Jones and California streets, next to Mrs. Chas. Crocker's residence.

It is one of the most important residences that has of late been erected. The design embraces more originality than is usually observed in such dwellings, inasmuch that it combines six different materials in its exterior, without detracting from the unity of the whole design.

The portion of the first story, window sills of the first story, quoins, and large front arched porch guarded by griffins, is composed of blue sandstone from a San Francisco quarry, laid up in Cyclopean style,, a style not often seen on this coast.

The remainder of first story and in some places to the second story window sills is built of pressed brick laid in red mortar, with terra cotta bands of string courses.

The superstructure is covered with shingles coated with Rosenberg's "Elastica" Varnish No. 1, and as near as possible left in the natural redwood color, except the gables which are finished in pebbled plaster on iron laths.

The tall stone chimneys and large circular tower form striking features of the outside. Finally the roof is of green slate with terra cotta hip moulds and iron rails.

The architects, Messrs. Curlett & Cuthbertson, have been ably seconded in their efforts to produce a beautiful creation by the several artists and artificers who have materialized it, and who are therefore, worthy of mention here. O. E. Brady performed all the stone and brick work——Mahoney Bros., the carpenter and joiner work——W. Cronin, the slate roofing——Duffey Bros., the plumbing and sewering——Fraser & Keefe, the polishing——John Mallon, the glazing——J. C. Jung, the ironwork ——Henry Fisher, the plastering——Gladding, McBean & Co., the terra cotta——Geo. Goodman, the artificial stone work—— Mitchell & Halbach, the interior decorating——The Electric Development Co., the electrical plant——Most of the interior cabinet work and finish was done by Plum & Co., and the Oakland Planing Mills.

The interior is finished in several varieties of hardwood, the main feature being the two-story hall and staircase in the centre of the building finished with Byzantine Dome and Arcade.

Owners' Acceptance of a Building.

The law is well settled that the owner does not accept a building by taking the keys and living in it, nor does he thereby waive in the slightest degree his right to have the contract fulfilled to the letter before he pays the contractor. His visits to the building while in progress do not alter the contract or put him under any obligations to accept work not in accordance with it; and if he orders changes at those visits, he only makes himself liable to pay a reasonable price for them, if they increase the actual cost of doing the work. Whether, after moving into the house, he can have changes made by other parties, without notifying the original contractor, and charge them to the contractor's account, is a a different matter. If the changes are altogether outside the contract, he is, of course, not entitled to make the contractor pay for them. If they were necessary in order to bring the building into conformity with the contract, he ought to have notified the contractor that they were required, and have given him reasonable opportunity for making them himself, before employing other persons to make them; and it has been held abroad that where this notice was not given, the contractor was not liable for any part of the expense. Aside from legal technicalities, however, it would probably be fair to both parties to have the contractor pay what it would have cost him to make the work conform to the contracts as nearly as this can be estimated, and let the owner pay whatever it actually cost beyond this.

An Extra Issue.

In July we will issue an extra edition of 3,000 copies. It will be the best illustrated of any issue yet presented. Sample copies are 20 cents each. Stamps of the smaller denominations will be received.

Design for a Country Dwelling.

The plan given was specially designed for a side hill residence. For this purpose all four sides are so finished that, no matter from what point the house may be viewed, it will present a finished appearance, the rear elevation being very picturesque. There is no attempt to elaborate finishes, the intent being to show a well constructed and carefully arranged country home.

In the basement will be found a commodious kitchen, servant's room and store room. The front part is left unfinished, but should the nature of the ground allow it, the space could be nicely utilized for a billiard room, or, if necessary, a children's play room.

On main floor are the parlor, dining-room and library. The bay window in dining-room is nicely arranged for an observation room. A dumb waiter connects with the kitchen, thus doing away with all smell and smoke from that place.

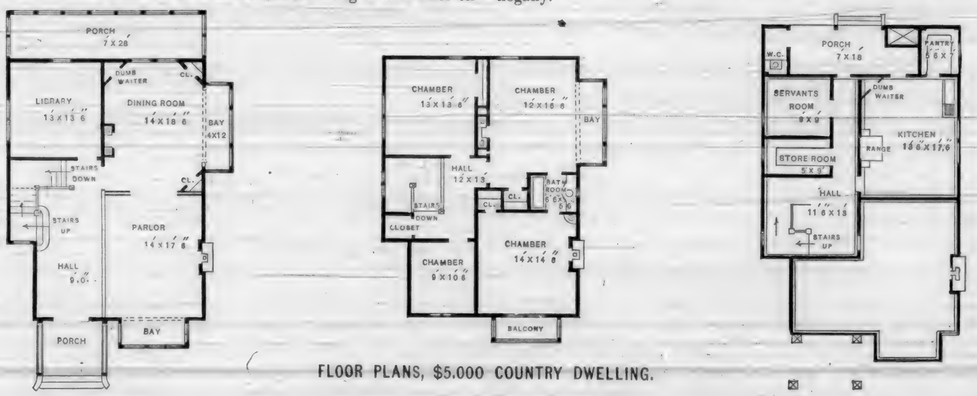
There are four chambers and bath-room on second floor, with ample closet room in each apartment. As shown, the house can be built for $5,000. The design was prepared by Mr. S. Newsom of this city.

FRONT ELEVATION, $5,000 COUNTRY DWELLING.

Honest House Finish.

The prevailing fashion or style for the past few years has been to stain interior woodwork almost exclusively, until those engaged in building have become thoroughly surfeited with the cheap imitation of mahogany that one sees on every hand. The uninitiated call it a "cherry" stain. Cherry, in its natural color, it should be understood, is a very light colored wood, of a warm yellowish shade. It is often treated with a red stain, to produce an imitation of antique mahogany, until people have come to believe that this is the natural color of the wood. To attempt to stain a soft wood to imitate cherry is utter nonsense. If there is any imitation about it, it is imitaton of mahogany, and an attempt at imitation of that grandest of woods by staining whitewood or pine will deceive nobody. Stain is a sham, every time. There seems to be some excuse for using a dark filler on oak finish, or a red one on mahogany to give them an antique appearance, but even this is a "sham."

Why not be honest in regard to the finish of your house, as well as in your business affairs? Common white pine, when finished in shellac, in its own inimitable color, is far richer than any imitation that can be produced by stains. Whitewood, poplar, cypress and even hemlock, are handsome woods, when properly treated, in their natural color, and improve with age, yet when stained look decidedly cheap and distasteful. Graining is another common subterfuge, and nothing but a cheat, for it certainly is not in the power of man to imitate nature's great handiwork so finely as to deceive, and if it should so result it would be a barefaced lie. If one doesn't like natural finish on the cheaper woods, and cannot afford hard woods, then why not paint? That certainly is honest. Let pine be pine, and cherry what it is, but don't try to make honest pine masquerade as mahogany.



FLOOR PLANS, $5.000 COUNTRY DWELLING.

SIDE ELEVATION, $5,000 COUNTRY DWELLING.

A Model Kitchen.

IT DID NOT COST VERY MUCH, BUT IS A MARVEL OF CONVENIENCE.

HERE is a unique kitchen, worthy of description: It is not large, having been built to fit a very little woman. The pantry is to the rear of it, the dining room to the right, the hall in the front, and all out doors to the left, though it stands on a narrow city lot. The kitchen projects beyond the hall, giving room for a door in front, and there is a second door in the front, leading to back porch and garden. The range chimney stands against the outer wall, and from door to door in summer the breeze blows perpetually past it. There are windows according to circumstances, some high, some low, some big, some little, some in the upper panels of the doors.

The temple of the household gods is finished entirely in wood, for æsthetic reasons quite as much as utilitarian. Wood finish means that not an inch of plaster appears. Ceiling, walls and floor are all of delightfully polished yellow pine. The casings of doors and windows are flat for ease of washing, and all the joints are as tight as tight can be. The work was done slowly and carefully under the supervision of the presiding genius. While the wood work, perfectly plain, as befits a kitchen, makes a really beautiful apartment, the veinings of the wood, the rich coloring, and the lingering forest odor suggest pleasant thoughts, and typify the home refinement of the lady who joyfully gives bread to her house, rather than the drudgery of menial toil so often put forward in its place.

The laundry tubs and sink are of solid white porcelain. But the wonderful economies of space, and numerous step-saving devices are the features of the place. There are slides from the pantry to the dining room sideboard. There are shelves in the triangular space over the cellar stairs. There is a table which pulls out of nowhere, just opposite the range and vanishes into thin air when the cooking is done. There are flour bins which swing out into the room when wanted, and push in flush with the wall again. When the mistress of the establishment wishes to put anything "down cellar," she doesn't go down herself, though the stairs are of gentle slope and easy of access. She touches a mysterious lever with her hand or foot, and up comes a section of the kitchen floor, bringing with it a series of shelves. Disposing the various articles thereon, she reverses the lever, and down goes the whole thing. The floor is as solid as ever, and the shelves are hanging in the dry, cool air of the cellar.

Costly? Not at all. Economy and convenience were the prime considerations. The house was built by an artist, who planned first the kitchen—his wife's workshop—then the studio—his own—and let the rest of the house group itself round these two. The kitchen cost no more in money than the most dingy type of city basement, and its owners call it worth all that it cost of ingenuity.

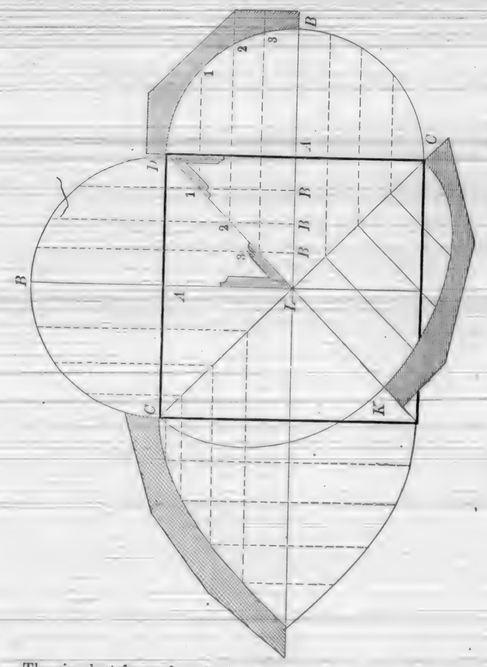
Sawdust is being used by some builders for mortar instead of sand. It is said to answer well, as it is one-half lighter than sand; it has some advantages when used on ceilings. Mortar made of quicklime and sawdust, mixed with cement, does well for brick or stone work.

Groins.

BY OWEN B. MAGINNIS.

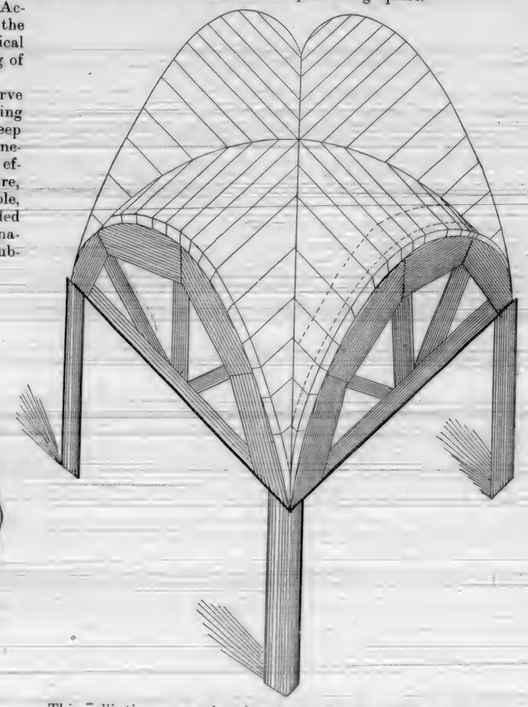
The prevailing of inclination of the present age of industrial science tending towards the simplyfying of all mechanical rules, with a view to their direct application in practice, is gradually bringing them within the scope of ordinary intelligence. Actuated by this object, the writer has endeavored to modify the existing methods put forward by our more eminent mechanical writers, for the construction of wooden groins or the centering of stone or brick groins.

Groin, as defined by architectural authorities, is the curve formed by the intersection of two arches, hence a groined ceiling or vault consists of a number interpenetrating vaults or deep arches, forming a proportionate number of groins as they penetrate each other. There are many different kinds of these effective details, employed in the higher branches of architecture, especially in ecclesiastical, where they are almost indispensible, except in those which admit of timbered roofs or are intended plastered for frescoing. In the hope that the following explanations will benefit those whose line of work may take in this subject, they are submitted for application.

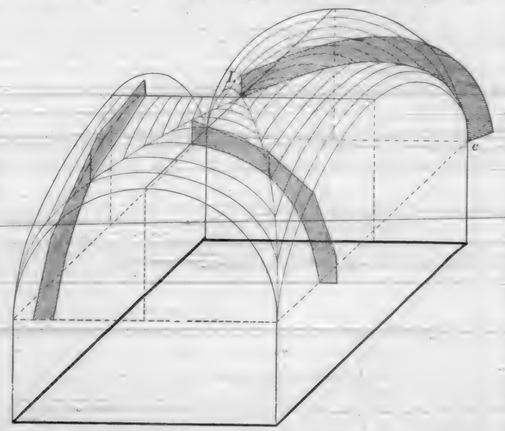


The simplest form of groin in general use in domestic architecture, is known as the barrel cylindo or cylindrical vault and formed by two semi-circular vaults passing through each other at right angles as shown at figure 1 and figure 2.

In figure 1, on the centre lines AB, continued outside the plan which is a square give the radii of the arch. The seat of the groin is the diagonal, over which the intersection of the vaults or groin will stand when found, and in position, or in other words the groin is formed by the revolution of two halves of the square which turn on the axis or centre lines and in their revolution while passing through each other intersect each other in a curve which is termed a groin, this can be easily seen by referring to figure 2, which represents a complete centre for a brick or stone groined ceiling. To construct this groin for lath and plaster, proceed as follows: Describe the semi-circles, CBD. CBD. divide the diameters, or side of the plan into any number of equal parts, in this case eight, and draw lines from these division parallel to centre lines AB, and perpendicular to diameters or sides of the plan, till they cut the semi-circle, continue them down till they meet the diagonals, at the points. Where they intersect the diagonals, raise up square lines and set off on them the heights which measure from the diameter to the circumference on the semi-circle. The curve traced through these points will be the outline of the curve of the groin, and a semi ellipse, as it is the section found by cutting the cylinder on a mitre or angle of 45 degrees, the plan being square.



This elliptic curve is the form of the groin and the sweeps for the ceiling can be cut to it as shown in figure 1. CK which will sit over CL, its seat. Its exact position is seen at figure 3. CL and those for the vault can be cut as DB, figure 1, two of each kind being necessary to complete the curves.



These are the principle curves to be gained, and the jacks or subordinate sweeps follow. As they are of the same outline curvature, their lengths can be obtained in this way.

If a ridge or centre piece be inserted, necessary when the groined vault is of large area, they will each measure from the groined ribs, to the ridge or center piece and can be easily found on the figure 1, as IB on the semi-circle will stand over BI on the plan, B2 on semi-circle will stand over B2 on plan, and so on to the center, against the diagonal piece cut like CK.

The top cut will be cut square and plumb as at B and the bottom end will be cut plumb vertically and on the angle shown by the level at D. The jack ribs shown here are for the left side of the angle and but similar pieces cut on the reverse angle, must be cut for the opposite side. Bevel at L, figure 1, shows cut of top end of center rib and they are shown in position at figure, where they continued down to the spring line to represent how these sweeps can be cut the full length, afterwards resawn for their different places. If the centerpiece be not inserted, the sweeps reach from diagonal to diagonal and are nailed against them. These plans should be laid on a drawing board or floor and all the cuts made from them.

Time Servers.

HOW many men there are, holding good paying positions as journeymen, who are really of no value unless kept constantly under the eye of the foreman or their employer! They are simply time servers, who take no interest in the business they represent beyond the actual time necessary to count them a day's work. They work when closely watched because they are obliged to, not from any motive of honor or interest in the business.

What can be expected of such workmen but that they will shirk their work and idle their time at every opportunity?

If you cannot give your employer your full time for which he pays, and take some interest in his business, you had better leave him at once. To this he is entitled, and has a right to expect it of you.

If your mind is not upon your work, you cannot expect to accomplish it with any degree of satisfaction to your employer or credit to yourself.

In going about from one shop to another it is a very easy matter to pick out the time servers. Upon the slightest pretext they drop their work to talk or look about, and are always ready to get out of the door the moment the clock strikes six, and their example is very rapidly followed by the apprentice or younger workmen. They have to be constantly watched, and this fact, being known to the firm, is not long in having its results.

Employers are more generally knowing to the habits and qualities of the men they employ then the men often realize, and they invariably know who are the time servers among them, so that when there comes a convenient opportunity or a lull in business, these are the first to be discharged.

It pays to be faithful and do your best at all times, and more especially when your employer is not watching. If you must idle away time, do it when he is about, but don't dishonor yourself or betray his confidence by taking advantage of his absence.

This is one of the worst features of our American system. It is an example which is set by the older men, and which is readily adopted by apprentices, and it is the exception rather than the rule that we find a young man who is sufficiently interested in his own welfare and his employer's as well to give his full time and attention to his work. Those who do this are sure of success, and it is from among such that have risen those men whose names are written upon the pages of history as having made their mark in the world, and left behind not only pleasant recollections, but a shining example that is worthy of a careful imitation.—*Sel.*

THE E. D. Albro Co., Cincinnati, Ohio, manufacturers of veneers and thin lumber, report: We have a steady demand this seasoned for our products. Builders and contractors appreciate well season lumber for inside finish, and the quartered sawed oak and light colored woods are being more called for. We have a full line of all kinds, including white walnut, (called butternut,) cherry, quartered oak, white maple, white ash, and mahogany.

Prima vera, or white mahogany, is rapidly coming into favor. This is a beautiful light gold color, and finished like satin wood, which gives a warmth and tone unexcelled by any other woods. They have a full stock of hardwoods of all thicknesses and kinds.

The True Test of the Value of Employes' Services.

THE very fact that a man enters a shop and there toils for the allotted number of hours makes it possible to settle his wages by the standard of another man performing a like service; but when the service rendered is the product of earnest thought and study, when the reaults of mental activity are thrown into the balance, combined with muscular exertion and mere routine work, then the reward can only be measured by the profit therefrom that insures to the employer, and the actual value of the service rendered is increased or diminished by the amount of knowledge, skill or energy with which the work is done. These qualities of mind, skill and diligence united are always necessary to enable any man to succeed in his vocation, and a man's advance above his competitors depends upon the magnitude and force of these qualities.

There must be in the highest order of service this trinity, executive ability, self reliance and originality, the power of planning. These three must co-exist to produce the highest order of merit, and to secure the greatest reward. For men may have skill, execution and ability within the limits of their assigned duties who have neither self-reliance or inventive powers, that enables them to succeed when thrown upon their own resources and outside of their regular work. A man may be a first-class man to carry out details, and work a plan with precision and correctness, and yet he may be an inglorious failure when in the position of chief director of the work of others.

Not only must a man be able to do work himself, but he must be able to plan for others and keep them profitably at work. He must have a quick eye for details, and a broad mind for generalities. He must be practical, and bring all general facts and truths in reference to the business under consideration for the accomplishment of his purpose.

He who realizes these truths, and acts upon them, will, if he has ability, climb to the top of the ladder, and will never have any questions raised as to the amount of his wages, because by his work he fixes the only standard by which his services are measured, and their value is ascertained by their product to his employer.—*Wood and Iron.*

Awkward Mechanics.

MECHANICS are often addicted to what can only be called awkwardness. In getting at a new or strange piece of work, some men make so much fuss, and appear to such poor advantage, that surprise is expressed that such an incompetent man should be employed. Most of this awkwardness, or "fumbling," could well be avoided by the man if he would only see himself as others see him. His attention is too much taken up by some detail of the matter, and he does not comprehend the whole amount of his work. A thorough mechanic gives a thing a thorough thinking over before he proceeds to execute any work. If the awkward mechanic would learn to think more, he would appear to much greater advantage, and would be worth more money to his employer.—*Man and Builder.*

New Cottage Homes and Details.

In this new work, the first copies of which have just been received, the authors——Palliser, Palliser & Co.——claim that all designs are new and original, and have never been produced before in any other architectural work. In a careful study of the book, we find that the California method of framing has been selected, it being much preferable to the old principles, which were to use large timbers and cut them all to pieces by mortising and notching down to levels.

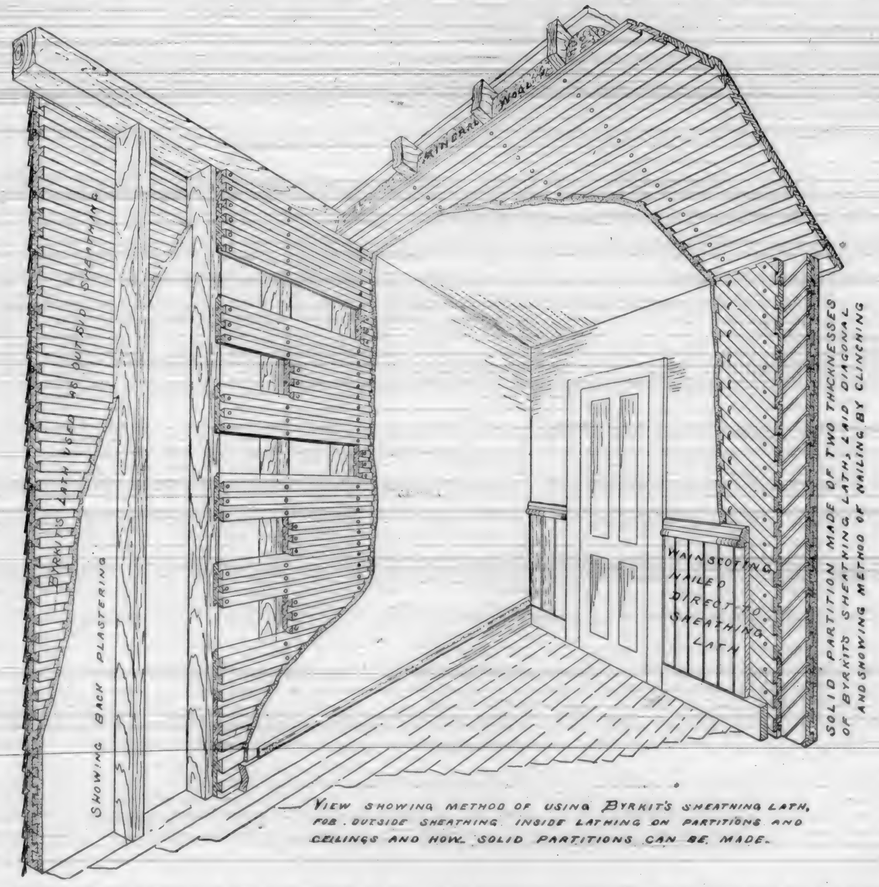
We commend the authors for one statement made in the "Prefatory." The cost of the buildings are all given, but the amount stated only holds good when plans are used, prepared by them. Fluctuations in prices of material and labor in various sections are freely acknowledged, and no one can guard against the same. The prices given are those for which the house can be honestly built, with prices of materials as they are generally quoted at time of issue.

Printed by Palliser, Palliser & Co., of New York and for sale at this office. Large work containing 250 designs, with numerous details, price $4 00.

Method of Applying the Byrkit Sheathing Lath.

THE Byrkit Sheathing lath has proved within the last four years, its staple qualities, and the fact that its use has been each year many times increased in quantity by all who have used it before, is a most certain indication of its superior merit. It requires but an examination by an expert in building, to immediately comprehend its practical value. The trials of house-builders have been largely increased by the unstaple methods of old-time lathing. Notwithstanding the many devices of breaking joints, doubling studding, vertical lathing on the solid, hoop lathing, etc., still corners and angles of rooms have universally exhibited a weakness in construction, indicated by broken plastering. The Byrkit lath makes it possible to construct a building *practically solid*, substantially, frost-proof and effectively fire-proof, since the system of construction possible by the use of the Byrkit lath, produces a building impossible to quickly destroy by fire, and such a building will rate by insurance companies, with the buildings of mill construction, or the slow burning construction. By referring to illustration No. 1, it will be seen that the exterior walls can be sheathed with this lath, with the keyed groove facing inwards, so while the exterior of a frame building can be finished with siding, shingles or slate, the inward face can receive a rough coat of "back plaster." Again, the interior face of outside studs can be lathed, plastered and finished upon what might be called (for the service it does in this respect), as an *inside* sheathing. The old system of construction involves an outside common sheathing, *extra* furring for back plastering, and finally a coat of lath and plaster, on the inside, which fails to add increased substantial strength to the frame as the Byrkit lath does. That which is so valuable for vertical construction, is equally good for the horizontal lines of floors. Drawing No. 1 illustrates the use of this lath for ceiling purposes, which, when once laid upon the ceiling, it is like the side walls, one homogeneous surface, greatly adding to the strength of the floors, instead as a deadweight suspended from the joists.

Diagram No. 2 illustrates the method of bracing and interlocking the angles of a room. No. 3 shows the possible use of the Byrkit lath for bracing long suspended partitions. While it is acting as counter braces on the principle of a truss, it is also serviceable for plastering upon. No. 4 indicates the use of Byrkit lath as a roof board, the keyed groove facing inward the same as the sheathing, and permitting at slight expense the finishing of an attic as a habitable room. Many houses have their exterior finished in half timbered and masonry work; for such a purpose the Byrkit lath is invaluable. Illustration No. 5 will give the reader a suggestion of its possibilities in this direction.



VIEW SHOWING METHOD OF USING BYRKIT'S SHEATHING LATH, FOR OUTSIDE SHEATHING, INSIDE LATHING ON PARTITIONS AND CEILINGS AND HOW SOLID PARTITIONS CAN BE MADE.

An intelligent architect can devise more uses for the material than here described, and he will find the lath is capable of solving more than one tough problem. One such example will be given here. Every architect knows the value of an inch, more or less, in planning within a limited space, studding having been placed the two-inch way, in many instances, to gain room. Now, here is a material that permits of doing away with studding entirely in such particulars. Take the Byrkit lath, double it, placing it back to back, making each piece cross the other at an angle of about 45 degrees, and nail together. When completed, this partition will be a solid two-inch partition, plastered on each face, and stiffer than any stud partition set the two-inch way—since it is one solid wall through and through from face to face of plastering. Owing to the fact that many are not familiar with the material, they have over-estimated its cost, and hence, while well impressed with its merits, they have failed to use it, since they have been misinformed regarding its expense. The actual

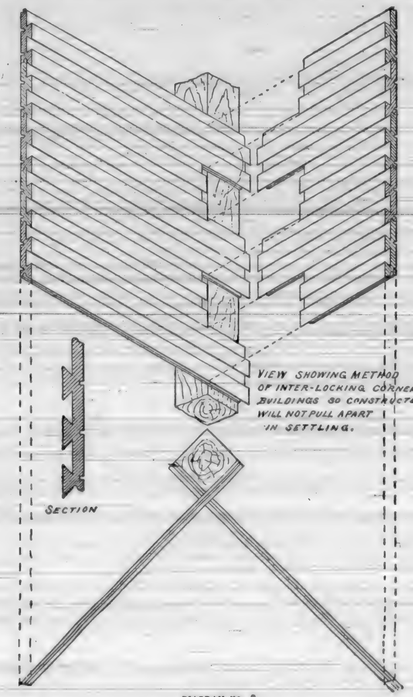


DIAGRAM NO. 2.

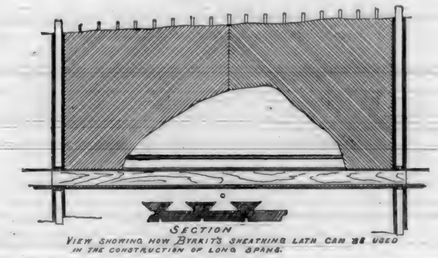
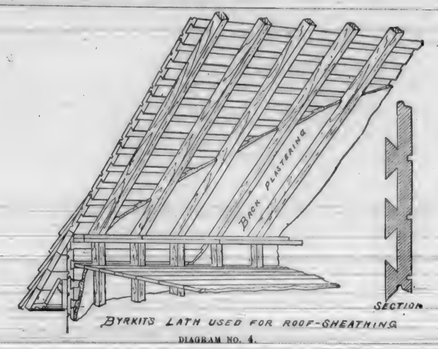
cost of plastering with this material is not exceeding 40 cents per yard. Ordinary plastering costs about 28 cents, but with ordinary plastering it must not be forgotten that extra material for sheathing, back plastering, etc., must be furnsihed, while the Byrkit lath covers all these requirements. The oft-repeated inquiry, "will it crack?" is caused from the long-time sad experience of old-style plastering. Accordingly, those who are unfamiliar with the principle of construction with this lath, are naturally critical. It has now been used on thousands of buildings in the Eastern States, and has stood the test in many of over five years, and it can be thoroughly demonstrated that *it will not crack the plastering*.



VIEW SHOWING HOW BYRKIT'S SHEATHING LATH CAN BE USED IN THE CONSTRUCTION OF LONG SPANS.

DIAGRAM NO. 3.

NOTE—The grooves at the back of sheathing shown by sections above are for the purpose of preventing cracking of plaster when the sheathing shrinks in dying.



BYRKITS LATH USED FOR ROOF-SHEATHING.

DIAGRAM NO. 4.

TESTIMONIALS.

AKRON, O., Sept. 22, 1888.

GENTLEMEN:—It is with confidence that we bear testimony to the advantages and advisability of using Byrkit's Sheathing Lath for all buildings, the advantages of which are set forth in your claims, all of which we have found by experience to be as represented, and shall not hesitate in the future to use same in the buildings under our charge. We have placed it in the O'Neil & Dyer Block in this city, and also used it extensively in the County Infirmary. Have also specified it for the M. E. Church, East Oakland, Cal., and other churches. Our Mr. Kramer has it in his own residence. Very respectfully yours,

WEARY & KRAMER, Architects.

CHICAGO, ILL., Oct. 7, 1887.

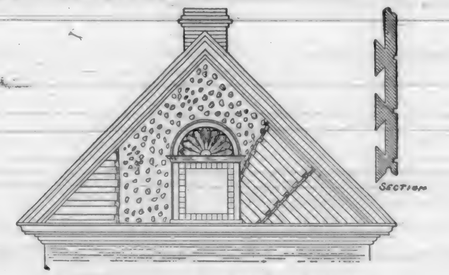
We have specified and used the Byrkit Sheathing Lath in several buildings which we have erected, and we are well pleased with it and recommend others to try it.

FLANDERS & ZIMMERMAN, Architects,
228 La Salle Street, Chicago.

AND MANY OTHER TESTIMONIALS.

The Byrkit Sheathing Lath has recently been introduced on this coast, and wherever used has given satisfaction. It appears to be a decided improvement on the old style of sheathing and lathing. It is designed to be placed on the inner face of the wall studding, using the ordinary lath on partitions. In some instances, as in the case of Geo. W. Percy, Esq., architect of this city, it has been specified to be used throughout the entire residence, no other lath being used. Among the buildings now erected on this coast, in which the Byrkit lath has been used, the following may be particularly mentioned: Eight avenue M. E. Church, Oakland; J. C. McMullin, Esq., residence, Highland Park, Oakland; Thos. Gardiner, Highland Park, Oakland. A barn has been built by Mr. Byxbee on the corner of 19th avenue and 17th streets, Oakland, using the lath on the outside, placing thereon a coat of cement lined off to represent blocks of stone. It has a very solid, as well as pleasing appearance.

Mr. John F. Byxbee, of 42 Market street, room 2, in this city is the manufacturer and Agent on this coast. By addressing him a note, you will obtain circulars, testimonials, etc., giving full particulars in regard to the Lath.



BYRKIT'S SHEATHING LATH USED FOR GABLES.

DIAGRAM NO. 5.

The Pacific Land, Loan and Building Company.

SAN FRANCISCO, CAL.

The Pacific Land and Loan Company is organized and operated upon the same general principle that lies at the foundation of all building, loan, protective and credit societies, unions and associations. It has all the desirable features of these organizations and possesses some which are not common to them.

GENERAL PLAN.

These Companies are corporations organized and operated under the laws of their locality. They issue stock of a stated par value which any one may purchase, and the holder pays upon the stock a certain monthly sum. The money thus accumulated in a Loan Fund is at once loaned out on real estate security and the profits arising from the investment, and from all other sources, together with the monthly payments (except a small amount which goes into the expense fund), are placed to the credit of the stock. These profits are periodically apportioned and credited by the Board of Directors. With the Pacific Land and Loan Company it is done every three months. Whenever the amounts thus placed to the credit of the stock equal its par value, it is said to "mature," and upon its surrender the holder is paid such amount by the Company. In addition to this the holder of stock may borrow money from the Company if he chooses to do so, re-paying the same in monthly installments.

SPECIAL FEATURES.

Organizations of this character have been universally successful in bringing handsome profits to their stockholders, and at the same time afforded them a safe place of deposit of surplus earnings or of making loans for business requirements. The Pacific Land and Loan Company has sources of security, and profit and special advantages to stockholders, not enjoyed by others. Its large resources, the fact of its doinga national, instead of merely a local business; its system of fines from delinquent stockho'ders; its lapses of forfeiture to the common benefit; its economy of investing its loan fund, and the small amount allowed to go into the expense fund and consequent economy of management, will cause its stock to mature in about five years, while from seven to ten years are required in the ordinary local Building and Loan Associations to reach the same result.

Moreover, under the loan system of the Pacific Land and Loan Company, the borrower gets his money in advance of his savings, by paying a small monthly interest and premium, has the use of the same before he accumulates it. The immediate and continued use of the money enables the borrower to gain more than he would have to pay for the use of the same. The non-borrower simply contributes his regular installments, and waits until his shares mature and he receives at least one hundred dollars for each.

BONDS.

The Secretary and the Treasurer are each under bonds in the sum of Twenty Thousand Dollars, for the honest and faithful performance of their duties.

COST.

For each One Hundred Dollar share of stock a first payment of two dollars must be paid to the Company or to its representative or agent when making the application for stock. After that, monthly installments of seventy cents on each one hundred dollar share must be sent to the home office, or paid to a legally authorized collecting agent. The first monthly installment will be due and payable one month after the date of the certificate of stock, and subsequent installments monthly, thereafter, until the stock matures.

PAYMENTS IN ADVANCE.

Any stockholder may deposit with the Company a sum of money for the payment of monthly installments as they fall due. The Company will receipt for the money, apply it in payment of the installments, and notify the stockholder when the sum is exhausted. Interest will be allowed on all such deposits at the rate of five per cent. per annum on the unused portions.

PAID UP STOCK.

Any stockholder may, after making the first payment, pay to the Company the sum of fifty dollars per share in lieu of all monthly payments. The Company will receipt for the money and will credit the stock thus paid up with the payments of monthly installments up to the time of its maturity.

FINES AND FORFEITURES.

If monthly installments are not paid up when due, fines will be assessed as follows: Ten cents per share for the first month of delinquency; twenty cents for the second, and thirty cents for the third.

If, after the assessment of the last fine, or fine of thirty cents for the third month's delinquency in payment of monthly installments, any stockholder remains delinquent in the payment of such installments or of any fines, for one month, then the stock upon which the monthly installments or fines remain so unpaid, if less than twenty-four monthly installments have been paid thereon, shall lapse and be forfeited to, and become the property of the Company. No notice of such lapse or forfeiture will be given to the stockholder and no sale of the stock will be made, but the stock will re-vest in the Company by virtue of the contract between the Company and the stockholder.

Lapses and forfeitures form an important factor in all institutions that depend upon periodical payments for their support. In most companies a stockholder's failure to make payments when due, works injury to the Company and thus to the other stockholders. With the Pacific Land and Loan Company, the result is directly the reverse. Failure to make payments when due results in fines, and continued failure works forfeiture. The fines, if paid, operate as a profit, and if not paid, the prior payments thereby forfeited become a profit. Either one or the other goes to the credit of the Company, thus hastening the date of maturity of other shares, and diminishing the number of payments required of those who continue to the end. At the same time the Company is relieved of its obligation to pay the forfeited shares.

NON-FORFEITABLE STOCK.

After twenty-four monthly payments have been made on stock it shall no longer be forfeitable for non-payment of mouthly installments; but the failure of a stockholder who is not a borrower to make payments on his stock for four months will be construed as an application for withdrawal, and thereupon the Company shall retire said stock, and the stockholder shall be entitled to all the rights of and subject to all the conditions imposed upon a withdrawing stockholder.

WITHDRAWAL.

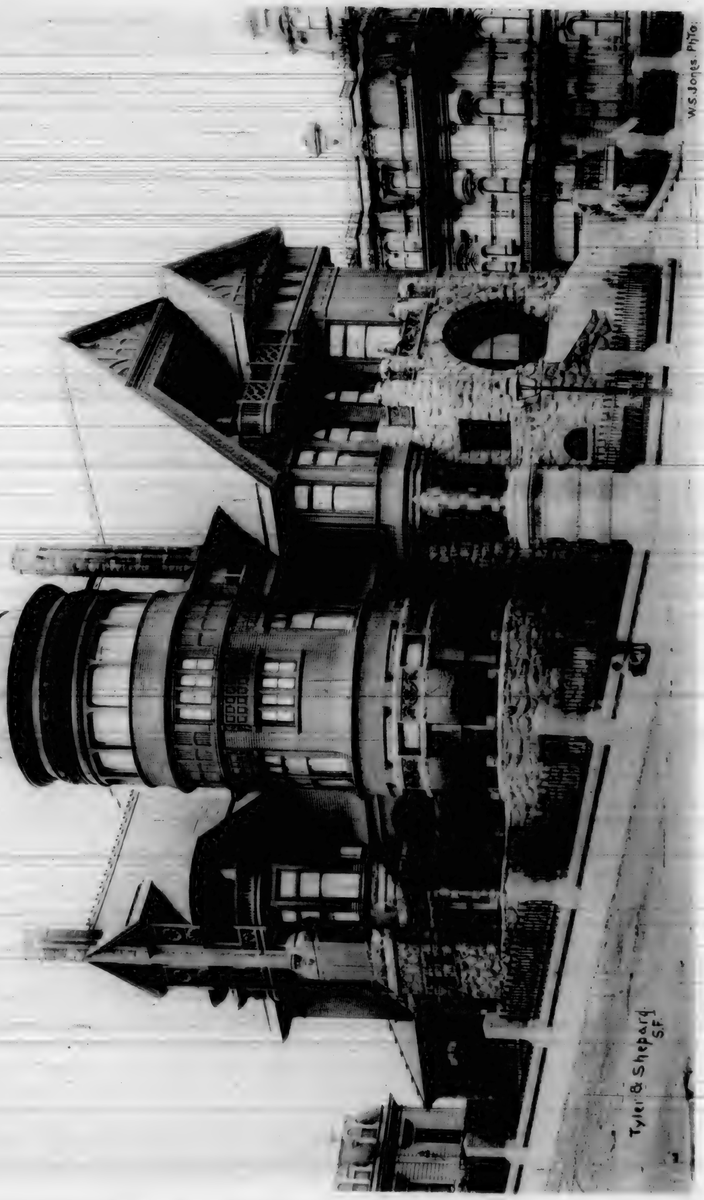
Any stockholder who has made twenty-four monthly payments on his stock and is not a borrower from the Company may withdraw from the Company, and upon such withdrawal shall receive a sum equal to the total sum paid from his monthly installments into the Loan Fund, with six per cent. interest per annum thereon, from the time of payment of such sums into the Loan Fund to the date of application for withdrawal.

TRANSFERS.

Any stockholder may assign his shares, providing said shares are in good standing and no loan has been obtained by the holder, by filling out the assignment on the back of the shares, and having the same witnessed and forwarded to the home office with fifty cents for approval and transfer. No assignment of shares will be valid unless the approval of the Secretary is endorsed thereon. If a loan has been obtained by a stockholder who desires to assign his shares, said shares cannot be assigned unless the mortgage property is also sold to the same party, or the mortgage paid off.

LOANS.

The monthly installment, together with all fines, interest, premiums, and profits from every source whatever, except the first payment, constitute the Loan Fund. The money of this fund is loaned at six per cent. interest per annum, and a premium of seven per cent. Loans can only be made to stockholders, unless there is a surplus on hand unapplied for by stockholders. All loans must be secured by first mortgage on real estate, and no loan shall exceed fifty per cent. of the actual cash value of the security given, except where the money loaned is used for the erection of a building upon the premises mortgaged. No loan of a less sum than two hundred dollars will be made. To entitle a stockholder to a loan he must hold stock the face value of which, at least, equals the loan applied for, and at least four monthly



Residence of W. H. Crocker, Esq.
CURLETT & CUTHBERTSON, Architects.

installments must have been paid thereon, either regularly as they fall due or in advance at his option. Applications for loans must be made directly to the Company and not through any agent thereof, and upon blanks furnished by the Company.

If the loan is desired to enable the borrower to erect a building on the real estate given as security, he may receive more than fifty per cent. of the value of the security, upon giving bond to the Company that the loan will be used for that purpose, and also a bond against mechanics' or other leins.

Interest and premiums are payable monthly at the time of paying monthly installments. Applicants for loans are required to furnish an abstract of title of the property offered as security and to advance ten dollars on attorney's fees for examination of title. No commissions are charged but the borrower pays all expenses. Improved property must be insured and the policy assigned to the Company when the mortgage is made or insurance is effected. Loans may be paid at any time upon giving thirty days' notice and the mortgage will thereupon be cancelled.

ILLUSTRATION.

Showing the costs and profits to be derived by the non-borrower of ten shares, or $1,000 worth of stock in five years, the estimated time of maturity of shares.

RECEIPTS.

Cash paid at maturity of stock	$1,000 00

EXPENDITURES.

Admission fee on ten shares, at $2.00 per share	$ 20 00	
Monthly installments on ten shares, at 70 cts. per share, amounting to $7.00 per month for 5 years	420 00	
At the time of maturity of shares there will be deducted for cancellation	3 00	
Total amount invested by a non-borrower, holding ten shares, amounting to $1,000.		$443 00
Thus at the expiration of five years, the non-borrower has made a handsome profit, amounting to		557 00

ILLUSTRATION.

Showing the result to a borrower of one thousand dollars, the borrower having been a stockholder for four months and owning ten shares of stocks.

EXPENDITURES.

First payment at $2.00 per share	$ 20 00
Four monthly installments at 70 cts. per share each	28 00

MONTHLY PAYMENTS.

Installment	$ 7 00
Interest on $1,000 @ 6 per cent	5 00
Premium on $1,000 @ 6 per cent	5 83
Total	$17 83

FIFTY-SIX MONTHLY PAYMENTS.

At $17.83 each	$998 48	
Cancellation fee	3 00	
Total		$1,049 48

RECEIPTS.

Cash, face value of stock upon maturity	1,000 00
Balance	$ 49 48

In other words, the borrower has paid less than fifty dollars for the use of one thousand dollars for five years, or less than one per cent per annum.

As showing how the system operates with each class, the following illustrations are instructive and suggestive.

ILLUSTRATION.

Showing the result to a borrower who builds him a home, borrower receiving $1500 and owning fifteen shares of stock.

BENEFITS.

*House is worth money it cost	$1,500 00
Fifty-six months' rent at $16	896 00
Total	$2,396 00

EXPENDITURES.

First payment, 15 shares, at $2 00 per share	$ 30 00		
Four monthly installments, before loan is effected, at $10 50	42 00		
Monthly payment after loan is effected :			
Installment	$10 50		
Interest	7 50		
Premium	8 75		
Total for one month, $26 75			
For fifty-six monthly payments		1,498 00	
Cancellation fee		3 00	$1,673 00
Benefits to the builder exceeds the costs			$823 00

The mortgage of $1500 is now due, but the stock has matured, is worth $1500 and will cancel the debt.

HOW TO REMIT.

Remittances may be sent to the Secretary at the home office by post office orders, express orders, drafts or registered letters.

SPECIAL NOTICE.

No representative or agent of the Pacific Land and Loan Company has power to waive or alter any of the conditions or terms expressed in the certificate of shares or to make any different or further contracts than set forth in the printed literature issued by the Company, or to give any receipt for money that shall bind the Company, except as herein provided ; and further, the Pacific Land and Loan Company will not be responsible for any bills contracted by any person claiming to be a representative of this Company, unless express authority in writing is given him by the Secretary. All negotiations regarding loans must be made with the home office. Agents have no authority respecting them.

Should you desire to become a stockholder, and there is no representative of the Company in your place, send for a blank application, fill it out yourself, sign your name and have it witnessed, then forward it, with first payment, to the Secretary, and you will receive your certificate of shares by return mail.

DESIGNS FOR NEWELLS AND BALUSTERS.

Just and Proper Methods Which Should be Observed by all Contractors in Their Relations to Each Other in Estimating.

Rights of Sub-bidders at the hands of General Contractor.—A principal contractor having been awarded a contract involving subcontracts, his estimate having been based upon sub-estimates, which he has solicited, should award the said subcontracts to the lowest bidders, and should notify the sub-bidders that their estimates have been accepted or rejected as soon as the contract has been awarded to him.

The fact that such sub-bids were received by the principal contractor, previous to the submission of his estimate, should be conclusive evidence that they were used by him.

Unsolicited Bids.—Should a principal contractor receive a sub-estimate unsolicited, he should not be considered under obligation to use the said bid, even if it be the lowest; but he must not reveal the bid, nor use it in any way to influence any other party.

Sub estimates in Architect's Office.—Subcontractors should avoid leaving their estimates in architect's offices when they are received there simply as an accommodation to and for the information of principal contractors. By such action there is danger that bids may become known to competing subcontractors before estimates are closed.

Danger Behind the Boards.

In many old country houses there are wide-mouthed, discarded fire-places that have been walled in temporarily or permanently, not with brick and mortar, but with boards. The droppings of soot and ashes from the flues of the chimney throat soon accumulate in a combustible heap on the old hearth, liable, any hour, when there is fire in any stove leading into the flue, to ignite by a falling spark or cinder and set fire to this wooden partition of a perhaps unused room, and the press has another mysterious incendiarism to report.

The only safe way is to brick such fire-places, or, if this is impracticable, and the old hearthstone is to be spared for occasional warming, its fire-board should often be removed and its walls and base stones brushed clean of soot and dust filled ashes, that are so readily ignited, else, some night may find your home cremated.

Get Some Tools.

A workman without tools is virtually a cipher. Like a cipher he must depend upon his neighbor for value, for standing alone, he is worthless. Mechanics do not need as many tools now as they did in the days of all hand work. Macinery has changed all that, but machinery will never allow a mechanic to dispense with his monkey-wrench, hammer and box full of small tools.

A mechanic needs no better recommendation than a good chest of tools, well worn and in shape. They tell more plainly than any written "character" what the man is. He may tell you one thing, and yet be another; but a look into his tool chest betray him. A man who has worked long enough at certain work to be able to call himself skilled therein, should have acquired all the tools necessary, and a man who claims many years' experience, yet can show but few or inferior tools, should be looked at closely before his statements are received.

Many a young man is working at the carpenter's, machinist's or millwright's trade who has not acquired a fair set of tools. The best way for such men is to buy one tool every week, or more if their wages will permit. Another way is to lay aside so much money from each week's wages for books, papers and tools. Divide equally between books and tools, make a list of what is needed, then purchase the first on the list, as soon as the allotted cash amounts to the requisite sum.

But a very few years of this practice will be necessary before the young man has a good kit of tools and a nice little library. Another thing, too, he will have: He will have a habit of saving a little money, and the habit will outlast his tools.—*Manufacturer and Builder.*

ACADEMY
.....OF.....
Architecture and Building
3066 South Ninth Street,
ST. LOUIS, MO.
An Institute for Theoretical and Practical Education for Building Tradesmen. Completed within three courses. Terms begin September, December and March. Students may enter in any one of these terms. The Academy will always assist its graduates in obtaining positions as Draughtsmen, Superintendents, Foremen, etc. Send for Prospectus.
H. MAACK, Principal.

CITY BUILDING NEWS.

Burnham near 25th, two-story frame. Owner, Aushek; cost, 1,600,

Dolores corner 24th, two-story frame. Owner and builder, W. W. de Winton; cost, 4,000.

Filbert near Dupont, two-story frame and alterations to three old frames. Owner, G. Musante; architect, W. Mooser; contractor, G. Rocca; cost, 9,000.

Fourth and Minna, three-story and basement brick. Owner, M. A. Hampton; architect, C. J. I. Devlin; carpenters, Moore Bros, 9,376; masons, Richardson & Gale, 8,566; wrought iron. Rix & Firth, 2,820; plastering, P. B. Downing, 1,325; cast iron work, O'Connell & Lewis, 4,200; tinning, etc.. Conlin & Roberts, 2,725. plumbing, Fritz & Kean, 1,384, total cost will be about 35,000.

Haight near Lyon, two-story frame. Owner and builder, A. H. Bailey; cost, 18,000.

Jones near Bush, two-story frame Owner, L. A. Berteling; architect, M. J. Welsh; contractor, R. Parker; cost, 8,500.

Pacific, No. 1338. alterations. Owner, Thos. Kennedy; architect, W. H. Armitage; contractor, J. W. Sims; cost, 2,800.

Stevenson near 20th, additions Owner, Robison; contractor, Wilberg; cost, 1,200.

Shotwell near 25th, three two-story frame. Owner and builder, P. Haver; cost, 7,000.

Steiner and Jackson, two-story frame. Owner, A. P. Redding, architect, Chas. Man; contractors, Herbst & McLeod; cost, 10,000.

Stanyan corner Waller, one-story frame; cost, 2,000.

Valencia, between 21st and 22d, three-story frame. Owner and builder, Mr. Partridge; cost, 9,000.

Western Addition, block 198, two-story frame. Owner, John Ryan; architects. Schmidt & Shea; contractor, S. J. Wilkens, cost, 3,200.

The above too late for Classification.

Adair St., flat and stable. Owner, Wm. Gercke; architect, Jos. Kennedy; contractor, Jos. Kennedy; amount, $2,120; limit, 70 days, signed, May 27; filed May 29; $550 framed; $500 roof on; $600 standing; finished, $470 completed.

Broderick, near Washington, cottage. Owner, H. Summerhayes; architect, H. J. Summerhayes, contractor, J. B. Gonyean; amount, 2,759; signed, May 28; filed June 1, 689 ready for shingling; 690 brown coated; 690 completed; 690, 35 days.

Buchanan, near Post, additional story. Owner, E. Durbrow; contractor F. A. Williams; cost 2,750.

Clay and Buchanan, painting etc. Owner Mrs. E. B. Hopkins; architects J. C. Mathews & Son, contractor, Geo. Eggers, amount 1,118; signed May 16; filed May 20; 75 per cent. of value of material used, and labor performed, balance 35 days.

Capp corner 24th, three two-story frame. Owner and builder A. Klahn; cost 5,000.

Castro and 16th, two-story flat. Owner Dennis Barry; architects, Townsend & Wyneken, contractor, G. W. Farnum; amount, 4,850; sureties, Harris & Jones; 2,500; signed, May 24; filed May 24; 1,000 framed; 900 ready for plaster; 800 one-half outside work is done; 900 outside doors hung; 1,250, 35 days.

California, between Mason and Taylor, two-story frame. Owner E. B. Pond; architects Mathew & Son; contractor W. F. Judson; cost 16,500.

Cole, between Haight and Page, six two-story frames. Owner and builder, Robert Cranston; cost 54,000.

Church and 30th, additions. Owner Captain Patterson; builder E. C. Worden, cost 2,000.

Dore and Bryant, to build. Owner, L. Cuneo & Co; architect, M. J. Welsh; contractor, C. Daly; amount, $2,500; $625 framed: $625 brown coated; $625 completed; $625, 35 days; signed May 6; filed May 6.

Ellis and Franklin, plastering of three houses. Owner, Antonio B. Gonzalez; architect, J. Marquis; contractor, J. O'Brien; amount, $1,845; signed May 10; filed May 17; $600 brown mortared; $400 arches finished; $345 completed; $500, 35 days.

Elizabeth, between Noe and Castro, move and alter. Owner, James McLaughlin; contractor, W. G. Jeffrey; amount, 1,550; signed, May 6, filed, May 13; 50 per cent. of material and labor as work progresses; 25 per cent. on completion; balance, 35 days.

Ellis and Franklin, mason work. Owner, Antonio B. Gonzales; architect, John Marquis; contractor D. Jordan; amount 1,450; signed May 10, filed May 11, 525 area walls built: 525 chimneys and fence walls built; 400, 35 days.

Ellis and Franklin, carpenter work. Three frame buildings. Owner, Antonio B. Gonzales: architect, John Marquis; contractor Moore Bros; amount 10,987; signed May 10; filed May 11; 1,944 rustic on; 1,944 stairs up; etc., 1,944 glazed etc.; 1,200 ready for painters; 1,155 completed; 2,800, 35 days.

Ellis and Franklin, plumbing. Owner, Antonio B. Gonzales; architect John Marquis; contractor, Wm. S. Snook & Son; amount 1,046; signed May 10, filed May 11.

Ellis near Gough, preliminary contract. Owner, J. J. Rauer; contractor J. F. Eaton; cost 2,700.

Folsom street and Juniper Avenue, to build. Owner, Chas. Bogan; architect, J. P. Chadwick; contractor, Geo. H. Walker; amount, 9,900; sureties, Irvine Graham and Caspar Dix, 2,500; limit, August 15, '89, signed, May 26; filed, May 31; 1,840 framed; 1,840 floored; 1,840 brown coated; 1,840 one coat of paint on; 2,540, 36 days.

Fillmore, corner Germania, two story frame. Owner, Fred Hueber; architect, W. Schrof; contractor A. Norton; cost 4,800.

Francisco and Kearny, warehouse. Owner Joshua Hendy; architect, John H. Hendy; contractor, Thos. H. Day; amount, 4,035; signed, May 4; filed May 17; 75 per cent. of value work performed on 1st of each month, balance 35 days.

Fair Oaks, between 21st and 22nd, two-story frame. Owner, Thos. P. Stoney, architects, Copeland & Banks; contractor, O. E. White; amount, $6,200; sureties, Chas. F. Doe and John T. Adcock; limit, 100 days; signed, May 24; filed, May 28, $1,500 enclosed; $2,000 outside finish on; $1,150 completed; $1,550, 35 days.

Fillmore and Germania, two-story house. Owner, Frederick Huber; architect, Wm. Schrof; contractor Albert Norton; amount 4,325; sureties F. Joost: limit August 17, '89; signed May 18; filed May 21; 850 chimney built; 850 outside finish on; 850 ready to paint, 850 fences and iron railings up; 1,085, 35 days.

Fell corner Devisadero, three-story frame. Owner J. B. Messing; architect W. Winterhalter, contractors Van Borstel & Conrad, cost 10,500.

Guerrero, between 25th and 26th, to build two flats. Owner, Adelia G. Tindermann; architect, Geo. Houston; contractor, Geo. Houston; amount, 3,840; limit, 100 days; signed, April 29; filed, May 17; 960 enclosed, 960 brown mortar is on; 960 white mortar is on, etc.; 960, 35 days.

Golden Gate Avenue and Webster, three-story frame. Owner, A. Lemaire; architect, H. Geilfuss; contractor, L. M. Weissman; amount, $9,445; signed, May 6; filed May 7; $1,180 framed: $1,180 roofed; $1,180 partitions set; $1,180 brown coated; $1,180 inside finish is on; $1,180 completed; $2,365, 35 days.

Golden Gate Avenue, near Laguna, three-story frame. Owner J. H. Curley; architect C. I. Havens; contractor P. Crichton; cost 7,500.

Green near Laguna, two-story frame. Owner E. L. Wagner; architect R. P. Waddell; contractor A. G. Vollmar; cost 6,000.

Golden Gate avenue, between Hyde and Larkin, six, two-story frames. Owner, James Shea, architect, C. J. I. Devlin; contractor, C. P. & G. H. Moore; amount, 9,186; sureties, C. S. Holmes and F. Joost, 5,000; limit, 90 days; signed May 13; filed, May 13; 900 foundation done; 1,200 framed; 1,800 brown mortared; 1,200 plastered; 1,200 ready for painting; 2,300, 35 days.

Golden Gate avenue, east Devisadero, two-story frame. Owner, David Irwin; architect, Emil John; contractor, Adam Miller; amount, 4,800; limit, Aug. 15, '89; signed, May 10; filed, May 14; 1,000 framed, 1,400 rough mortar is on; 1,200 accepted; 1,200, 35 days.

Golden Gate Avenue and Laguna, three-story frame. Owner, Jno. H. Curley; architect, Chas. I. Havens, contractor P. Crichton; amount, 7,000; signed May 6; filed May 9; 1,300 enclosed; 1,300 brown mortared; 1,300 hard finished; etc, 1,350 completed. 1,750; 35 days.

Howard, Nos. 1703, 1705, 1707, 1709 and 1711 and 207, 209, 211, 213 13th street, brick foundations and repairs. Owner, James Phelan; architect, John Marquis; contractor, Martin Fennel; amount, 4,500; signed, May 15; filed, May 16; 1,650 Howard street houses are finished; 1,650, all accepted; 1,200, 35 days.

Howard and 23d, one three-story and one 2-story frame. Owner, John H. Rosenbohm; architect, Chas. I. Havens; contractor, C. Zwierlein; amount, $9,600; signed, May 2; filed, May 7; $1,800 enclosed; $1,800 outside finish, $1,800 outside mill work on; $1,800 completed, 2,400, 35 days.

Howard and Seventh, three-story frame. Owner, John Wallace; architect. M. J. Welsh; contractor, Hugh McCracken; amount, 6,531; signed, May 9; filed May 16; 1,632 75 framed, 1,632 75 brown mortared, 1,632 75 completed; 1,632 75, 35 days.

Howard and 10th, plumbing, etc. Owner, estate, James Lick; architects, Wright & Sanders, contractor, Wm. F. Wilson; amount, 12,487; signed, May 6; filed, May 25; 75 per cent. on first day of each month as work progresses, balance, 35 days.

Howard, No. 822, 824, 826, 828, 830, and 832, alterations, etc. Owner, John F. Boyd; contractor, Alexander J. Wheeler; amount, $26,564 50; limit, September 10, '89; signed, May 24; filed, May 31; $1,300 ready to raise; $1,500 foundations laid to cellar walls; $2,500 first tier of joists on; $2,500 chimney up, $4,364 brown coated, etc; $5,800 completed; $6,600 50, 36 days.

Howard and Erie, three-story frame. Owner James Buchanan; architect S. Hatfield; daywork, cost 7,000.

Jupiter and Bryant, two-story frame. Owner, Maurice Healy; architect, M. J. Welsh; contractor, Thos. F. Mitchell; amount, $2,340; signed, May 7; filed, May 8; $585 framed; $585 brown mortared; $585 completed; $585, 35 days.

Laguna, between Pine and Bush, two-story frame and basement. Owner, C. Wrights; architect, H. D. Mitchell; contractor, J. B. Gonyeau; amount, 2,480; limit, three months; signed, May 11; filed, May 13; 600 framed; 600 brown coated; 700 accepted; balance, 35 days.

Laguna, near Hayes, build brick foundation. Owner, Mrs. L. A. Mowry; architect, James E. Wolfe; contractor, R. Parker; amount, 1,075, signed, May 28; filed, May 31; 75 per cent. of value of work done, balance, 35 days.

Manitoba near Vazoo, two-story frame. Owner D. W. Irwin; contractor F. Bohnenberg, cost 3,500.

Mississippi, 150 south Butte, to build. Owner, John T. Cairns; architects, Townsend & Wyneken; contractor, R. O. Davis; amount, 2,944; signed, May 14; filed, May 15; 400 enclosed; 700 brown mortared on; 700 sash hung, etc.; 408 completed; 736, 35 days.

McAllister, west Pierce, two frames. Owner, J. B. Caritey and wife; architect, Wm. Mooser; contractor, Geo. W. Farnum; amount, 11,650; signed, May 21; filed, May 23; 1,747 50 first tier of joists on, 1,747 50 roof on; 1,747 50 brown coated; 1,747 50 glazed, etc; 1,747 50 completed; 2,912 50, 35 days.

McAllister, west Pierce, plumbing, etc. Owner, J. B. Caritey and wife; architect, Wm. Mooser, contractor, Thos. Clark & Son; amount, 1,050; signed, May 22; filed, May 23; 75 per cent. on first day of each month as work progresses; balance, 35 days.

Minna and 6th, to build. Owner, A. Cassini; architect, T. J. Welsh; contractor, Wm. Dorgen; amount, $1,900; sureties, John Gleeson $1,000; signed April 29; filed May 7; $700 brown coated; $700 completed; $500, 35 days.

Minnesota, between Solano and Butte, two-story frame. Owner, Margaret Lovett: architects, Schmidt & Shea; contractor, Geo. J. Doering; amonnt 3,300; sureties, Jacob Ahlbach; limit 90 days; signed May 21; filed May 27; 618 enclosed; 618 brown coated, 618 hard finished; 618 completed, 828, 35 days.

Noe and Ford, two-story frame. Owner, Roger Waters; architect, M. J. Welsh; contractor, E. W. Hyde, amount, 3,600; signed, May 14; filed, May 15; 900 framed; 900 exterior finish is on; 900 completed; 900, 35 days.

Noe corner Ford, two-story frame. Owner, R. Waters; architect, M. J. Welsh; contractor E. W. Hyde; cost 4,000.

Page and Lyon, two-story and basement house. Owner, J. B. Martin; architect, J. J. Clark; contractor, White Bros; amount $3,730; sureties, T. M. McLachlan and Geo. T. Shaw, $3,730; signed May 16; filed May 18; $900 framed; $900 brown mortar is on; $900 inside finished; $1,030, 35 days.

Polk and California, alterations. Owner, Mary A. Grant; architects, Pissis & Moore; contractor, T. Hock; amount, $2,175; signed, May 22; filed May 28, $1,000, brickwork is completed; $630, completed; $545, 35 days.

Pine and Webster, alterations, etc. Owner, John J. Rohrbach; architect, Chas. I. Havens; contractor, R. Doyle & Son; amount, 2,399; signed, May 8; filed, May 9; 599 enclosed; 600 outside finished; 600 completed; 600, 35 days.

Post and Buchanan, frame building. Owner, Regina Mitchell et al; architects Salfield & Kohlberg; contractor, Rohling & Crawford; amount 3,600; sureties, F. Joost and J. J. McKinnon; 3,600, limit 65 days; 900 framed; 900 brown coated; 900 completed; 900, 35 days; signed, May 4; filed May 9.

Pine, between Webster and Buchanan, two-story frame. Owner M. W. Murry; architects Copeland & Banks; contractor J. Geary; cost, 8,000.

Pierce corner Pine, building for Old Ladies' Home. Owner Mary Ann Crocker; architect A. Page Brown; contractors Mahoney Bros; cost 115,000.

Sanchez and 16th, two-story frame. Owner, L. C. Dibert; architect, C. Zwierlein; contractor, C. Zwierlein; amount, $3,300, sureties, J. F. Kennedy and L. B. Doe, $3,000; signed, April 29; filed, May 7; $1,000 enclosed; $1,475 completed; $825, 35 days.

Steiner and Pacific, two-story dwelling; Owner, Mrs. N. G. Kittle: architect, J. C. Mathews & Son; contractor, W. Winnie, amount, $8,178; limit Oct. 1, '89; signed May 15; filed May 17; 75 per cent. of material used and labor done as work progresses, balance, 35 days.

Seventeenth and Sanchez, two-story frame. Owner, C. H. G. Wiebusch; architect, Bernard Dreyer; contractor Bernard Dreyer; amount, $4,400; limit, Aug. 10, '89; signed, May 13; filed, May 15; $1,000 framed; $1,200 brown mortared; 1,100 white mortared, 1,100, 35 days.

Scott and Bush, two-story frame. Owner, E. Rattigan; architects, Copeland & Banks; contractor, W. E. B. Stiles; amount, $2055. sureties, G. D. Nagle and E. Phillips, $1,000, limit, 60 days; signed, May 27: filed, May 28; bills to be paid weekly as work done and materials used; bal., completed.

Stanyan, near Grattan, two-story frame. Owner, D. L. Westover: architect, McDougall & Son, contractor, J. R. McLean; amount, $5,200; limit, 92 days; signed May 29; filed, June 1; $500 chimneys up; $700 ready for shingling; $750 floors laid; 950 white coated; 900 completed; 1,400, 36 days.

Stockton, near Chestnut, one-story frame. Owner, A. J. Garibaldi; architect, Wm. Mooser, contractor, John Bruce; amount, 3,500; sureties, John S. Morgan and Henry C. Robinson, 2,000; limit, 70 days; signed, May 21; filed, June 1; 75 per cent. of value paid as work is done, balance, 25 per cent., 35 days.

Stevenson, south Herman, to build. Owner, Mrs. H. A. O'Brien; architect, T. J. Welsh; contractor, H. A. Conrad; amount, 2,895; signed, May 21; filed, May 22; 650 framed; 650 brown mortared; 700 completed; 895, 35 days.

Seventh and Howard, to raise, etc. Owner, G. F. W. Fahrenkrug; architects, Huerne & Everett; contractor, Jacob Beck; amount, 2,400, signed, May 8; filed, May 9; 600 brick work done; 1,200 completed; 600, 35 days.

Sanchez cor 17th, two-story frame. Owner C. H. J. Wilbusch; contractor B. Dryer; cost 5,000.

Stanyan corner Waller, one-story frame. cost, 2000.

Taylor Place, to build. Owner, Mrs. M. Gorman; architect. W. H. Bayless; contractors, Mulford & Rodgers; amount, 1,875; sureties, J. C. Rodgers and W. H. Barton; limit, 85 days; signed, May 7; filed, May 14; 300 framed; 500 first coat of plastering is on; balance at completion.

Tenth and Howard, wrought and cast iron work. Owner, estate, James Lick; architects, Wright & Sanders, contractor, Rix & Firth; amount, 5,500; signed, May 6; filed, May 28; 75 per cent. paid on first of each month, balance, 35 days.

Treat avenue and 26th, alterations, etc. Owner, Wm. F. Klein; architect Chas. I. Havens; contractor R. P. Traxler; amount, 2,475; signed May 23; filed May 27; 550 water pipes in; 550 outsid finished; 600 completed; 575, 35 days.

Tennessee and Butte, move and alter. Owner, Herbert Crapo; architects, Townsend & Wyneken, contractor, R O. Davis; amount 1,275; signed May 10; filed May 11; 200 moved; 450 studded up; 300 completed; 325, 35 days.

Third and Everett, alterations, cost 600.

Van Ness Avenue and O'Farrell, iron lathing for R. C. Cathedral. Owner, P. W. Riordan; architect, T. J. Welsh; contractor, M. J. Donovan; amount, $3,175; signed, May 4; filed, May 29, 75 per cent. on value of work done, balance, 35 days.

Van Ness Avenue and O'Farrell, plastering. Owner, P. W. Riorden; architect, T. J. Welsh; contractor, Thos. Winters, amount, $9,300; sureties, Richard Doyle and Richard McCann; signed, May 13; filed May 29; 75 per cent. on value of work done, balance, 35 day.

Van Ness Avenue and O'Farrell, heating with hot water, R. C. Cathedral. Owner, P. W. Riorden; architect, T. J. Welsh, contractor, Duffy Bros; amount, $3,950; sureties, O. E. Brady and Peter Crichton; signed May 29; filed, May 29, paid on completion and satisfactory test of work.

Van Ness Avenue and O'Farrell, plumbing and gas fitting for R. C. Cathedral. Owner, P. W. Riorden; architect, T. J. Welsh; contractor, Wm. J. Nelson, amount. $1,798; sureties, $1,000; signed, May 9; filed May 29; $899 work is roughed in; $400 completed, $499, 35 days.

Valencia and Herman, to build. Owner, M. A. Mercer; architect, T. J. Welsh; contractor, R. Doyle & Son; amount, $5,969; sureties, P. F. Ward and T. Winters, $3,000; signed, May 1; filed, May 7; $1,489 framed; $1,489 brown mortared; $1,849 completed; $1,502, 35 days.

Vallejo, west Gough, two-story frame. Owner, G. T. Bigelow; architects, Percy & Hamilton; contractor, J. B. Gonyean; amount, 5,800; signed, May 17; filed, May 21; 75 per cent. of value work done, first Saturday of each month; balance, 35 days.

Waller and Germania, one building on Waller and one on Germania. Owner, Chas. Maxwell and wife; architect, John Gash; contractor, Jessie Rickard; amount, 6,650; sureties, Michael Casey & J. A. C. Macdonald, 2,000; signed, May 13; filed, May 15; 832 tin roof on; 832 brown coated; 832 brown coated and sash in; 832 two coats paint on; 832 50 complete; 827 complete and accepted, 1,662 50, 35 days.

Waller, near Devisadero, two story frame. Owner Louis Friedlander; architect P. S. Barber; contractor E. W. Hyde; cost 5,000;

COUNTRY BUILDING NEWS.

LOS ANGELES.

The only way to realize how Los Angeles is growing is to take a ride through the city and its suburbs and note the number of buildings that are in course of construction. Residences of all sorts and descriptions, from the palatial abode of the millionaire to the less pretentious domicile of the breadwinner, are going up by the hundred, and in spite of the vast number of business places already thrown open, there are those who can foresee that the supply is, by no means, equal to the coming demand, and are acting accordingly. Among the additions to the city that are in contemplation is a two-story brick building on the north east corner of Third and Spring streets, the size to be 140x192 feet. The estimated cost of the project is $45,000.

NEW BRICK BLOCKS.

It is stated on good authority that the residence of Mr. J. A. Graves, on the corner of Third and Fort streets, will be moved, and that in its place a handsome business block will be built. It will be of brick and four stories in height.

Two new blocks are contemplated near the cable engine house, in East Los Angeles, and they will be commenced very shortly.

A Main street architect reports that he has plans for four business blocks, which will be commenced in about six weeks. Two of these are on Main street, one on Los Angeles street, and the other on Spring street.

BUILDING NOTES.

The excavations for the foundations of the J. M. Griffith building, on Fort street, is about completed. This building is to be five stories in height, and will cover an area of 120 feet on Fort street by 150 in depth.

The foundations for the building to be occupied by the Los Angeles Athletic Club, on Spring street, near Third are being put in.

Mr. O. W. Childe is about to make extensive additions to his residence on Main street. The plans are in the hands of Mr. Hass, the architect, and the additions will cost, when completed, in the neighborhood of $15,000.

A contract has been completed between W. H. Jay, of Glendale, and J. A. Murphy and H. E Dillon, of this city, to, on or before the 17th of July, 1889, erect and finish the building to be known as the West Vernon School house. The cost of the structure will be $2,190.

OAKLAND.

One of the most conspicuous and handsome houses in this city is being put up on the east side of Harrison street, south of Durant, by Toohig & Moore, for D. Edward Collins. The house is after plans prepared by Charles Mau. The house is of two stories, with attic and basement. The cost of the building complete will not be far from $14,000.

The same builders have under way a two story flat of twelve rooms on Webster street near Fourteenth for a Mrs. Mour, to cost about $6,000.

On Ninth street between Harrison and Alice streets L. H. Levy is erecting a double two story flat of six rooms in each flat or twenty-four in all. The building is of substantial modern construction and cost about $7,000.

A handsome two story modern house of two stories with nine rooms, bay windows, and all conveniences is being erected on the west side of Harrison street, near Durant by Mrs. J. W. Koland of which W. H. Weilbye is the architect and contractor. The cost of the improvement is about $4,500.

At the southwest corner of Seventh and Alice street a two story house of twelve rooms is being put up for Josephine Nolan by Hugh McCracken, to cost $2,500. The same contractor has recently completed a cottage on the opposite side of Alice street for Jeremiah Casey, at a cost of $1,900.

Contractor S. J. Shelper is erecting a handsome two story tenement house of eighteen rooms for J. C. Adriance on the corner of Sixth and Madison streets for $5,000.

E. L. G. Steele has had some extensive repairing and improving done to his house on the corner of Sixth and Jackson streets. He is now having a stable erected on the lot immediately adjoining his house. Con Cannon is the contractor.

S. R. Andrews is erecting two cottages of five rooms each on Madison between Fifth and Sixth streets. The cost will be $1,500 each.

A neat little cottage of five rooms is being erected by J. H. Babcock on Fourth street between Oak and Madison. The cost will be about $1,000.

On Third street between Jackson and Madison, the house of Mr. Lewis which has been raised is being improved with an additional story beneath. Contractor Louis Macomber is doing the work.

Louis Macomber is erecting a cottage of five rooms on Third and Alice streets for Mrs. Lizzie Honohan. The cost is $1,750.

J. A. Easton has contracted to erect a building for J. Nelson, to cost $1,800.

A. S. Barney has contracted with F. J. Farnham to erect a building on Oakland avenue, near Vernon street, to cost $2,600.

Smith & Lake are building a double flat on Nineteenth and Brush streets for J. Hayes, after plans by W. H. Weilbye.

W. H. Weilbye has prepared plans and is putting up a handsome two-story house for Ex-County Clerk Andy Ryder at Loomis, Placer county, where he will make his home.

Toohig & Moore are building a two-story house for Mr. Murry on the corner of Twenty-eight and Myrtle streets to contain seven rooms and cost about $5,000.

Mrs. J. W. Roland is putting up a two-story flat on the west side of Chestnut street near Tenth of modern design and containing five and six rooms each. W. H. Weilbye is the architect and builder and the cost will be about $5,000.

The cottage of Mrs. Hinkling on Campbell street, between Seward and Taylor streets, is being remodeled and an addition built at a cost of about $900. I. H. Underwood is doing the work.

Mahoney & Shay are the contractors for a seven room basememt cottage being erected to the order of Dr. R. E. Cole on Union street, near Tenth, to cost about $2,500.

On the west side of Union street, between Tenth & Twelfth streets, W. H. Martin is building for himself two modern two story houses of eight rooms, to cost $2,800 apiece.

The new residence of W. H. Sigourney on Third avenue and East Fourteenth street is built by W. H. Weilbye, after plans of his own, and will cost when completed about $10,000.

Jesse Rickard has contracted with Josephine, wife of R. Mastick, to erect a building on lot 77, Encinal Park tract, Alameda, for $3,050.

W. H. Weilbye is building a barn 30x49 with a 15 foot shed, on Broadway near Durant, for Whittier, Fuller & Co., to cost about $1,000.

SAN DIEGO.

The subjoined list of buildings is only a partial one, and represents only the more important building enterprises, still it foots up a total of some $200,000. This does not include the new opera house nor the changes in the Consolidated bank building, besides many other structures, now planned, but not yet in course of construction.

About two months ago the excavation made for a building over a year ago on the corner of Fourth and E streets, began to look as though something was to be done towards erecting a structure there. The plans were made and work was soon commenced. The building is now up to the second story, as far as it will be built at present. Messrs. Pauly & Gassen are owners, and expect to expend $65,000 in the construction. McDougal & Sons are the architects, and J. C. Sloan has the contract for the work.

The foundation was laid this week on Sixteenth and N streets for a warehouse 50x90 feet, and two stories in height. It is a frame structure, costing, perhaps, $5,000. It is being built by Captain Sherman, and is to be used in connection with the San Diego, Cuyamaca and Eastern railroad freight depot. It will probably be covered with corrugated iron, and will be finished in about two months.

B. R. Arnold has a two-story brick building in course of construction on his lot on the north-east corner of Fifth and K streets. The building will cost in the neighborhood of $12,000.

Monday morning work will be commenced on the Backesto block, on Fourth and H streets. It will be two stories and basement, built entirely of brick. W. F. Fitzpatrick has the contract. The building will cost about $25,000. J. P. Backesto, of San Jose, is the owner.

The two new school buildings are going rapidly forward. On the one on Twenty-fourth and K streets about fifty men are employed, and it is all inclosed. The roof is partly on, and the plumbers are at work in the basement. The one on Sixth and B streets is only up to the second story, but the work is being pushed, and both will be completed in time for the September term. They are both built on nearly the same plan, Comstack & Trotsche being the architects and J. P. McCormick the contractor. The total cost, furnished, will be in the neighborhood of $30,000.

Mrs. Parker has laid the foundation for a two-story frame dwelling at the corner of Union and Albatross streets. The estimated cost is $5,000.

In the early part of next month Judge Pierce will commence work on his residence on Florence Heights. It will be a one story frame structure, to cost $3,000.

Many private dwellings are receiving alterations and additions amounting to from $200 to $1,000, so that builders are kept in a reasonable amount of work.

FULTON.

Calvin Osborne is erecting a commodious dwelling.

SAN LEANDRO.

A contract has been placed on record between F. I Williams and Rev. John McEvoy for the erection of an addition to the convent in San Leandro to cost $5,530.

SAN JOSE.

[From our Special Correspondent.]

First, between San Antonio and San Fernando, two-story brick and sandstone business block. Owner C. Doerr, architects J. Lenzen & Son, contractor J. H. Kohlhauer, cost 20,000.

First, between Santa Clara and San Fernando, three-story brick and sandstone business block. Owner Mrs. Knox Goodrich, architect G. W. Page, contractor for carpenter work, R. Summers. 4,860, contractor for brickwork, W. J. Wolcott, 3777, total cost 8,637.

Brown, corner Delmas Avenue, one and one-half story cottage. Owner S. H. Leach, architect J. O. McKee, contractor A. J. McIlvain, cost 2,000.

Fountain Alley, additions to building, Owner L. Archer, architects, J. Lenzen & Son, contractor F. Davis, cost 2,521.

Crittenden, near St. John, one-story cottage. Owner H. Prindle, architect J. O. McKee, contractor J. E. Clinton, cost 1200.

Second near Santa Clara, additions to M. E. Church. Owner M. E. Church, architects Lenzen & Son, contractors Mabury & Phillips, cost 4,636.

Tenth and San Antonio, one-story cottage. Owner J. R. Patton, architect J. O. McKee, contractor J. J. Hill, cost 3,000.

Seventh near Keys, two-story dwelling. Owner J. B. Wyatt, architects J. Lenzen & Son, contractor A. Kelsey, cost 3,000.

ALAMEDA.

A modern $3,125 cottage house will soon be erected for Mary C. Lewis on Verdi street, near Santa Clara avenue.

SANTA ROSA.

A brick addition to the building occupied by P. H. Kroncke, of the Santa Rosa Planing Mills, is being put up, 40x61 feet, one-story high.

HAYWARDS.

Daniel Luce, of Haywards, is about to erect a $12,000 brick block on B street in that town.

Mr. Hackett will commence the erection this week of a $1,500 barn for Dr. Du Bois on his place on Haywards avenue.

Mr. Hackett has secured the contract for building another $2,000 cottage on the corner of Hayes and Ward streets for Dr. Du Bois. The work will be pushed, as the cottage has already been spoken for.

SAN FRANCISCO, JULY 15, 1889.

FOR some time, the question has been agitated in regard to the consolidation of the American Institute of Architects and the Western Association of Architects. To decide the question, a vote was taken simultaneously in New York and Chicago. Even the most sanguine friends of consolidation did not fortell the unanimity with which the project would be received. In the American Institute, but nine negative votes were recorded. In the Western Association a still more positive vote was polled. Out of a total of 265 votes there were but *three* against the proposition. We do not know by what name the new organization will be known; the *National Association of Architects* has been suggested. The old name of the *American Institute* is dear to scores on this coast and we should like to see it retained. San Francisco has one of the largest Chapters, in point of numbers, in the Union, and one and all of its members wish a long and happy life to the new organization.

WHILE our city savants are considering the subject of *durable* pavements, they should also consider the hygienic qualities of the materials used. In 1878, over 12,000 people died in New Orleans from yellow fever, and it is stated as a fact, that a large proportion of that number contracted the disease from the germs held by the absorbent pavements in use at that time in the city. Where asphalt is used, there are no crevices to hold dirt. In cobble stone pavements especially, there are innumerable crevices which hold the dust and other organic matter, in summer and pollute the air by its exhalations in damp weather. Another fact should be seriously considered. Stone pavements as ordinarily laid absorb this organic matter, which, festering in the earth, becomes a breeder of disease. There is a serious question for all City Councils to consider besides the one of a few dollars difference in cost, and that is, what pavement is the best, in a hygienic sense, for the welfare of our people?

A RECENT decision in a New York Court of Appeals, would lead to curious results if our own Judges should decide the same way. The Judge declared "that a stable, however well it may be built, is a nuisance in the vicinity of handsome residences, and that an action can be brought to have it removed." In this city, most of the fine dwellings have a stable in close proximity thereto and are regarded as valuable adjuncts. We think, however, that in the decision, reference was only made to livery stables or the immense buildings used by the Car Companies for their stock. It would be difficult to control Californians in the selection of a site for a stable, as some of the finest ones are located in the midst of various districts devoted to artistic dwellings.

DURING the six months ending June 30, 1889, there was received in this city 134, 352, 727 feet of pine lumber and 94, 400, 715 feet of red wood lumber. Of shingles, the number is 52, 294, 325, while the figures 13, 232, 100, represent the number of laths. In connection with the spruce, laurel, ash, maple and oak sent to this city, the grand total number of feet received is 230,000,000. This is the largest amount ever received for a similar period in the history of the city.

WHILE the above is true in regard to the *amount* of lumber received, it must be allowed that many previous similar periods have been much more satisfactory as regards business. Prices are reasonably low, yet a very large quantity of lumber is piled up in our lumber yards awaiting purchasers. The late disastrous fires in Seattle and other towns, will, for the purpose of rebuilding, draw from those who supply this city, many millions of feet, that would otherwise be added to our already extensive stock on hand.

EXPORTS of lumber are not as large as usual so far this year being, to the date given, but 6,744,901. The largest amount for a single year was that of 1882, when the total reached 22,094,393 feet. In 1888 the amount was 21,600,015, while the former year exceeded the latter in number of feet, the *value* of the shipments of the latter year was greater by about $100,000, showing that a finer grade of lumber was exported.

SUB-CONTRACTORS and contractors should take notice of the following provision in the new lien law of Ohio: "Any contractor or sub-contractor, who shall purchase materials on credit, and represent at time of purchase that the same are to be used in a designated building or other improvement, and shall thereafter use, or cause to be used, the said materials in the construction of any building or improvements other than that designated, without the written consent of the person of whom the materials were purchased, with intent to defraud such person, shall be deemed guilty of a misdemeanor, and on conviction, shall be punished by a fine not exceeding five hundred dollars."

IN another section a good point is represented which declares "that every person for whose immediate use, enjoyment or benefit, any building erection or improvement shall be made, shall under this Act, be included in the words owner or proprietor."

AMERICAN elevators, so far, seem to have the preference in European cities. Per example, two of those in use in the Eiffel tower are of American manufacture, the other two being French. While the speed of the latter is 200 feet a minute, the former is just double or 400 feet a minute. Thus, the products of American genius are gradually being introduced throughout Europe. In connection with above we may add, that in comparison with this country, the elevator is but little used in the continent of Europe.

A PRINCIPAL contractor should have a list of selected subcontractors, on whom he is satisfied he can rely both for good work and for its prompt execution, and such only should he ask for bids. He knows that there are subcontractors whose offers would involve him in loss, no matter how low their estimates might be. When a mason is carrying up the walls of a building, and is compelled to stop work and discharge his men in the midst of their operations for the want of cut stone or of iron or other work, delayed through the want of executive efficiency on the part of the subcontractors for such part of the work, he not only experiences a loss of temper but also a considerable amount of his anticipated profits. The architect is also considerably chagrined to find the progress of the work thus brought to a sudden stop, and comes to the conclusion that he is also materially interested in the proper selection of the subcontractors. He, therefore, evinces a certain amount of reasonable concern, when the principal contract is awarded, as to who are to be the subcontractors, and thus there is established an interested relation also between the subcontractor and the architect. Fortunately for the latter the former knows that it is necessary for his work to pass the inspection of the architect and to meet with his approval before it will be accepted by the principal contractor.

ONE important measure was introduced at the late meeting of the National Associations of Builders. Briefly stated it is as follows: On certain work contractors are required, when submitting estimates or closing contracts, to furnish bonds, and, in order to comply, are obliged to ask friends to become responsible for them. This necessity is always an embarrassing one, and while, on the one hand, the contractor feels very delicate about asking the accommodation, on the other hand his friends consent with great reluctance. The suggestion referred to is that a bureau or department of the National Association be established, which may furnish such bonds under proper conditions and for a satisfactory consideration. The committee appointed, reported favorably in regard to the suggestion offered and recommended that steps be taken to establish such a bureau. The matter will be discussed in full at the next Annual Convention.

WHEN the trades unions set up their rules limiting the number of apprentices to be taught their trade in any shop, they did it for the purpose of preventing the market being over-stocked with skilled labor and the consequent reduction of wages from an over supply. Contrary to expectations the rule has not worked as intended. Skilled workmen in every branch of mechanical trades are more numerous than ever. Those who are the most injured by the rule, are the sons of Americans, who are virtually prohibited from learning their father's trade. Our employers are constantly obtaining skilled labor from Europe, who take the places that should be filled by our own children. Is it any wonder that we see so many young men drifting around our streets, when they are actually debarred from entering our workshops and learning a legitimate trade.

THERE appears to be such a thing as a diagnosis of disease in wood and the botanical physicians profess to know that it may be contagious or sporadic. Dry rot is called contagious and it is said that the germ of that disease may be communicated to sound wood by tools which have been at work in diseased. It is thought possible that the theory accounts for many incomprehensible breakages of timber. The suggestion is that sound lumber should not be cut with the same saw, without cleaning, that has passed through stuff affected by dry rot.

FIRE crackers have caused a loss during the past five years of over $2,000,000. Pennsylvania seems to have suffered the most. It is a noticeable fact, that fires started from fire crackers exploding, have a small average loss. In this city of wooden buildings, too much care cannot be exercised in preventing conflagrations, and it is an open question if some other more appropriate way cannot be devised for our youth of both sexes to celebrate the noisy Fourth than by the heathenish way of exploding fire crackers. Fireworks can be tolerated, but the dangerous Chinese bombs, double heads and fire crackers should be suppressed.

How to Teach Boys to Become Bricklayers.

THE following practical remarks were delivered by President Stevens at the late annual Convention of the National Association of Builders:

I have my ideas on the above subject, and I will express them to you. You want to know how we would teach a boy to be a bricklayer in our school. First, I would have a lecturer to teach him by lecture all that could be taught him in regard to his business, or the materials connected with it; for instance, I would have the lecturer tell the boy what sand is made of and all about sand; I would have him tell the class what lime is made of and how it is made; I would have him tell the class what bricks are made of and how they are made; I would have him tell them all about cement and explain to them its nature and combination. By the time the boy was through with those lectures he would know why you could not make mortar,—I am an iron man, and I do not know much about bricklaying, but I will tell you all I know about it,—the boy would then know why you could not make mortar out of ashes and lime, or out of loam and lime. He would know why you had to use gravel and why you had to use sand.

After the boys have been taught to that extent, I would have them taken to a limekiln and let them have an object lesson,—let them see how it was done. I would have them taken another day to a brickyard, and let them see how bricks are made. I would have them taken to one of our terra-cotta establishments, and let them see how terra cotta is made. I would suppose then, so far as that was concerned, the boys' education was completed theoretically.

Now comes the question, "What shall we do with them?" I would have then a first class journeyman mechanic, a journeyman bricklayer,—such a man as you would make one of your foremen to take charge of your buildings,—and I would have him take these boys, a class of say six or eight, or ten, and say to them, "Boys, you have been told by your professor how mortar is made; now I am going to show you." Then he would call up his laborer, and say, "Here, Billy, bring so many bushels of lime, and so many bushels of sand;" and he would bring them and put them down on the ground. Then the teacher would tell them "Now, when you put water on this lime, it slacks it. Now, we are going to put water on this lime and we will see it slack." Then we would mix that up, and it would make mortar, and he would be talking to them, and all the time they would be seeing. That finished, he would say to the boys, "The first thing you have to learn is how to use a trowel. Here are the trowels. Now, William, you put a shovelful of mortar on each one of those boards, and each one of you boys take a trowel, and I will show you how to spread this cement and mix the mortar," and keep the boys practicing at that, and say, "George, that ain't the way; do it this way." They would soon learn how.

The next day he would come there, and say, "Boys, I am going to build a wall for you, and I want you to see how I do it." He would dig out, and commence to lay it out, and talk to the boys as he went on; "Boys, we spread our mortar this way; we take our bricks this way; this is the way we put a leader; we run up three courses here and three courses there, and we use this plumb-bob to see that it is plumb, and then we strain a line over this way and lay a number of bricks in proportion. That is the way we will do it." Then we would tell the boys how he was going to strike the joints. He would build that wall with those boys looking at him. "Do you understand that, boys?" "Yes." Then he would say, "William, have this wall torn down and everything cleaned up. Now, boys; to-morrow morning we will go to work;" and the next morning he would say to the boys, "I want each one of you to lay out a wall as I did yesterday. You saw me do it, and I want you to do it." They would start in, and he would watch them. "John, don't pick up your bricks that way, this is the way. Bill, you are not doing as I showed you, run that corner up and run this up. George, that is not the way to hold the plumb-bob, hold it this way, and strike your joints this way."

Do you think those boys would learn anything? I think in six months' time I would have pretty good bricklayers out of those boys. After I had taught them how to put a wall up, I would take them on pressed brick-work, and I would teach them how to run arches; and I think those boys would learn more under six months' instruction of that kind than they would in six years in your building with nobody to tell them, and left just to pick up what they could.

SKETCH FOR A COUNTRY DWELLING. M. G. BUGBEE, ARCHITECT.

OUR New City Hall has been the subject of much inquiry among many of those who have watched its gradual advancement in regard to the money so far spent in its construction. We are able to give full particulars in regard to the same, which should be kept for reference.

The New City Hall to June 30, 1889, has cost $3,750,106 59 and there should be added to this and deducted from the balance in the Treasury, for payments to fall due on existing contracts, the sum of $29,653 73, and the total cost to date will reach $3,779,760 32. The estimated amount to complete the New City Hall, without considering the cost of a mansard roof, but finish the two McAllister street wings, the basement and unfinished rooms in the main building on the upper floors, lay out the walks and grounds, erect all proposed granite steps and fences, and build a suitable main tower, will amount to $1,000,000 additional and absorb the balance unexpended June 30, 1889, together with the levy for this and most of that alowed as the limit for the next two fiscal years. This will make the New City Hall cost, when finished complete, without the mansard roof, about $4,780,000, and take until the latter part of 1892.

On February 2, 1874 over fifteen years ago, architects David Farquharson and John P. Gaynor submitted a report to the Board of Supervisors containing a detailed estimate of the cost to that date and the amount required to finish the building as above, without the mansard roof. They reported: * * * "The total cost of the building would be the sum of $4,854,060," which is not very far out of the way, as appears at this date.

TO calculate the number of shingles for a roof, ascertain the number of square feet and multiply by 9 if shingles are laid 4 inches to the weather, by 8 if laid 4½ inches, and 7⅕ if laid 5 inches. The length of rafter of one-third pitch is equal to three-fifths of width of building, adding projection.

IF our architects should adopt the above absurd rule, how long would it be before the profession would be classed among the "Lost arts." When the sewing machine was introduced what a hubbub was raised that it would cause thousands of women to be thrown out on the charities of the cold world. In early days flooring was worked by hand, and a tough job it was was too. When a machine was made through which thousands of feet could be run in a day, a universal howl was made that the bread and butter was to be taken from thousands of men. Same way in regard to molding machines, mortise and tenon machines, by which it is possible to make hundreds of doors in a single day. Shingle machines caused a universal growl among the craft. In fact, every improvement in machinery was received by a howl from those whom the old fashioned ways supported. Reference is only made to these few facts to show how differently the situation is to-day from the "good old times." Give our own boys a chance to learn a trade, and with their natural abilities, they would soon outstrip the imported men, rendering it unnecessary to send abroad for the very skill that lies dormant in our midst.

Business Changes.

E. J. Weston has opened an office at 873½ Market street and will in future devote his whole attention to his profession as an architect.

John & Balcynski have gone into partnership and secured offices on the corner of Grant avenue and Geary street.

M. G. Bugbee is nicely located at 330 Pine street.

Shingles, Hips and Valleys.

SHINGLES in valleys and on hips last longer when laid with their grain running in the same direction as that of the hip or valley. When they are cut on the angle, the end wood absorbs water and hastens rot, whereas the straight, close running grain of the wood rejects the moisture more, and leaves the shingles more durable. Few carpenters can now be found, except among the older hands, who are familiar with this mode of shingling, as it is really a very old, yet excellent one, and yet comparatively simple, involving little more time than the later and inferior method. All that is necessary, is to taper the shingles so that they radiate as it were from the angle of the hip or valley to straight joint square to the eave. Combs on ridges are scarcely to be recommended, but if they must be employed for the sake of economy, are best run up on that side on which the angle of the rain in that latitude usually falls. Tongued and grooved ridge boards are an improvement on the comb, that is, if the joint is well bedded with white lead. Wooden ridge rolls are better still, and the best of all is the galvanized iron cresting. Rolls and ridge boards should be well nailed through the shingles and into rafters, and not to the shingles only. Hip shingles should be cut with the saw to make a straight job and not hewn with the hatchet, and properly overlapped.

Another Question of Law.

THE *American Architect* has another question of law propounded by a subscriber as follows:

A builds a block of tenement houses and employs B, an architect, to prepare plans, let and superintend the works, C is contractor and D a sub-contractor. The specification has this clause in it: "The contractor or his sub-contractors, and his and their workmen, must agree (and this writing is the agreement) that they shall remove from the building any work or material not in accordance with the plans, details, elevations and specifications. And they must agree that the opinion and decision of the architect is binding to them, as well as it is to the proprietor." The sub-controctor D signs a contract with the main contractor C to the same effect, that is, that the opinion and decision of the architect is binding to all, etc.

The specification further reads, that it must not be understood that the sub-contractors will receive certificates direct from the superintendent. The main or principal contractor only will receive these, assigned for the special benefit of the sub-contractor.

Now, D, the sub-contractor, quarrels with C, the main contractor, as to certain works to be done and which he (D) tries to avoid; finally he is compelled to do them, and gives final receipt for all his work, including all disputed matters. A day after D, the sub-contractor, calls on the architect with a bill of extras, one-fourth of which the architect acknowledges as correct, and three-fourths as incorrect, and then, because the architect refuses to agree upon the whole, D sues the principal, A, for a number of items and damages in which all the disputed matters settled with the main contractor, C, figure again.

The question before the architect, B, is this:

Question.—1. Shall the specifications and contract stand good before the law where it says that the main contractor shall only get certificates to be assigned to the sub-contractor?

2: Shall the agreement of A with the main contractor and his sub-contractor, "that the opinion and decision of the architect is binding to them, as well as to the proprietor," remain valid in law?

As you have a legal gentleman attached to your editorial staff, we will be pleased to see the *American Architect's* answer to these questions, as it is a matter in which every citizen making a contract for a building is interested.

Respectfully yours, V. & S.

Answer.—We do not find anything in the contracts and other facts referred to in the above communication to prevent D, the sub-contractor, from collecting his claim from A, the owner, providing he can satisfy a jury that the work which he claims as an extra was ordered by the owner or by the architect, and, in the latter case, that the architect has authority to give the order. The terms of the contract and the fact that there was any contract at all between the plaintiff in the action and the principal contractor, would have nothing to do with the case except as evidence tending to rebut the plaintiff's claim that the work in question was done under contract between him and the owner. The decision, however, in such cases is always with the jury; a written contract between the plaintiff and some third party is evidence merely and not conclusive; and if the jury believes that the owner and plaintiff entered into a separate and distinct arrangement for the work in question they will find for the plaintiff.

The clause in the sub-contract subjecting all matters of dispute to the decision of the architect would have no binding force in any action between one of the parties to this contract and a third party. The owner not being a party to the contract could take no advantage of the clause.

Whether the receipt given by the sub-contractor to the main contractor covered the work in question would also be a question for the jury; if the work was outside the sub-contract and undertaken under a direct arrangement with the owner, of course a receipt given to the main contractor would not bar the sub-contractor from recovering the price agreed upon with the owner.

We are therefore compelled to answer both of the questions which our correspondent puts at the end of his communication in the negative; that is to say, the specifications and contract would not "stand good before the law," nor would the decision of the architect be binding, at least in the sense which our correspondent means. This whole question, like most of the disputes that are continually arising in the building trade, is one of fact simply; and the best way to avoid them is for the architect not to get a general authority from the owner to order extras, but whenever anything is needed, that is not in the contract, to make a new formal contract in writing, either with the main contractor or some other person.—*American Builder*

A Painter and the Architect.

A GOOD deal of attention has been directed of late to the relationship which exists between the painter and the painter and the architect. The subject has been discussed at length in our columns, and was debated at several of the painters' conventions lately held.

A careful study of all the opinions advanced shows that, while the trouble may be attributed to a variety of causes, the peculiar position which the painter occupies as sub-contractor is largely responsible for it. There are drawbacks attendant on the position of all sub-contractors, as they are dependent more or less upon the completeness of the work of those who have gone before them. The painter's lot, however, is hardest of any for it is the painter who has to make good the work of all the others.

As a business man a contractor carefully estimates the work he is to perform, and gives in his price accordingly. But how is a painter to allow for the work he may or may not have to do in filling open joints and making good the resinous and shaky timber?

Of course the architect should not pass such defects; but if he does, the painter has no remedy. As a fact, the architect or superintendent does not scrutinize the work in progress with such minuteness as he does at its completion, and thus is the poor painter made the scapegoat.

One way out of the difficulty would be for the painter to insist upon the insertion of a clause in his contract that all work delivered to him should be in proper condition. A remedy is certainly worth trying for.—*House Painting*.

Architectural Picture-Making with Pen and Ink.

BY B. LINFOOT. PUBLISHED BY THE OLD ELOR COMPANY.

This work is intended to convey to the architect and student, the manner in which a building may be portrayed on paper so as to convey to the mind of him who is about to build, that the bright jaunty free hand sketch shown, will when finished in the reality, be just what is wanted. Some men will spend months looking for a desirable location for building; when found, an architect is selected to prepare the plan. May be he gets a sketch of a very good house, but in such hard straight-lines, that it produces on the client a feeling of disappointment, and frequently of abandonment. In this work, the architect is shown how to keep the enthusiasm of his client alive and active, by submitting sketches of his contemplated work and surroundings, To the student, the illustrations termed "Sky Suggestions," are worth careful study. They will show what few lines are absolutely necessary to form a picture.

The book is handsomely illustrated with 32 large plates in size 12x18 inches. We will have copies of this work on sale, which will be furnished at publishers price, $4.

The Children's Home at the Park

The accompanying engraving fitly represents the new play house for children, which has lately been finished, and is now one of the features of Golden Gate Park. Messrs. Percy and Hamilton were the architects. The view presented is a very good one, and gives an adequate idea of the structure without an extended description.

An Apology—Academy of Science Building.

For the past two months, our engraver has been at work on a fine cut of the Academy of Science Building. The engraving was finished and was in the hands of the party who runs the ruling machine, to put on the border, etc. By one of those unaccountable accidents which sometimes happens, the block broke into a dozen pieces, and of course was rendered utterly useless. Immediate measures were taken to reproduce the engraving, but they were unavailing to have the same ready for this issue. It was a grevious disappointment to the manager as well as to hundreds who had engaged copies as a souvenir, for the ceremonies of laying the corner stone on the 12th of July.

A Tin Roof.

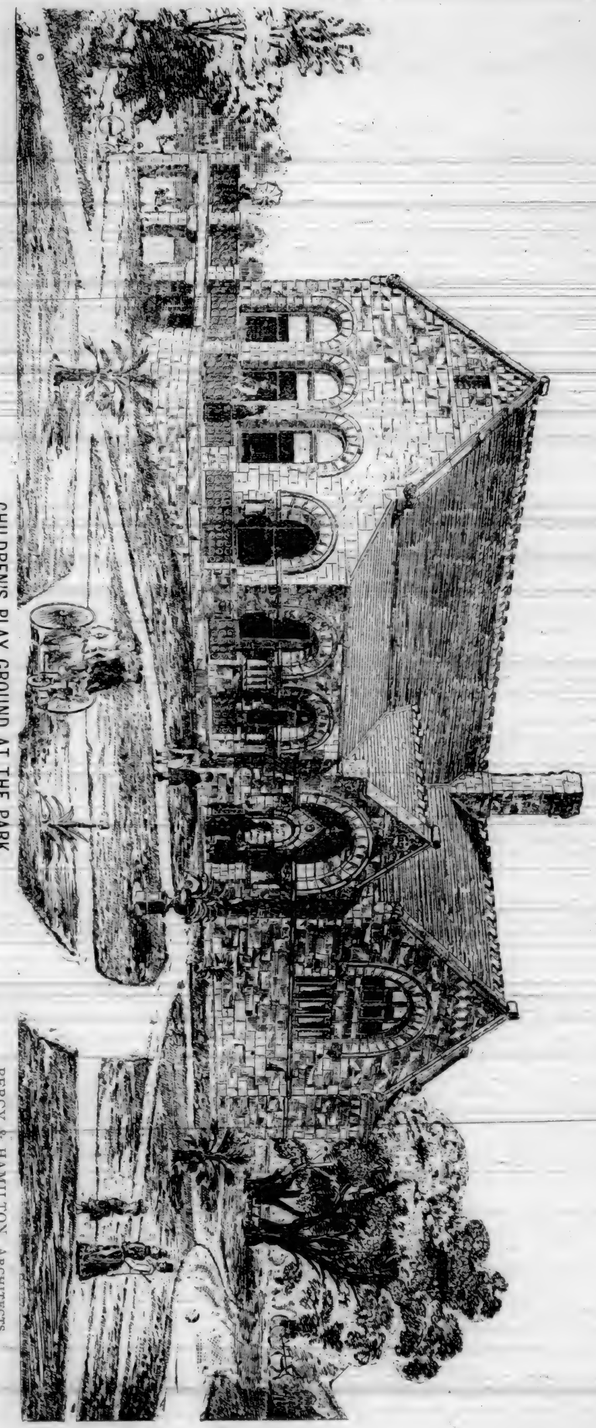
Messrs. Merchant & Co., have just issued a book entitled "A Tin Roof." It is a neat, handsomely bound volume and will be sent free to all applying for the same to Merchant and Co., Philadelphia. It is very instructive in regard to the best methods of laying tin plates, and although it is not egotistically written, still it does convince its readers that the plates manufactured by Merchant & Co., are among the best in the market. Architects especially should see that the above mentioned book is in their reference list.

Palliser's American Architect.

Messrs. Palliser have taken a new departure in their publication department and now issue a quarterly number, giving 100 pages of designs and plans for every description of a country dwelling. These quarterly parts begin with April 1889, and are sold at $1 00 each. The subscription price is $4 00 per year. They are in paper covers, but may also be had in cloth covers at $2.00 each.

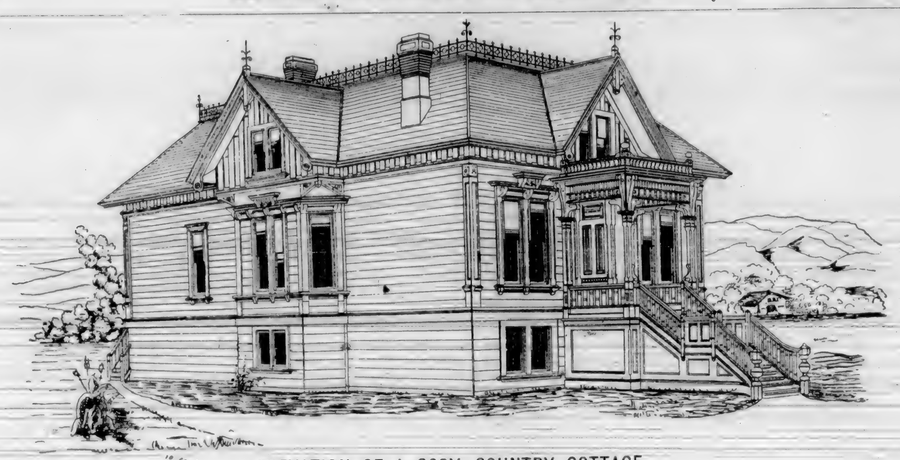
Mechanics' Institute Fair.

Several times we have called the attention of our mechanics to the necessity of having an exhibit of mechanical skill at the next fair of the Mechanics' Institute. We have been spoken to in regard to the matter more than once. A committee has been appointed by the Chapter of Architects in regard to a similar matter, and information can be obtained through either G. W. Percy or H. T. Bestor.



CHILDREN'S PLAY GROUND AT THE PARK.

PERCY & HAMILTON, ARCHITECTS.



ELEVATION OF A COSY COUNTRY COTTAGE.

Brick Piers.

THE only way to build a good and substantial pier of brick is to lay each course the full size of the pier, and not to, as if often done in this city, build up the outer four inches of the pier seven or eight courses high and afterward fill in the interior, as it is impossible to get proper bed or bond; brick of the hardest possible quality only should be used where heavy weights have to be borne. Avoid bats and use as little mortar as is necessary to get solid work. Make the size of piers so that whole brick can be used to obtain proper bond; tamp each brick after it is laid in position with a hammer or brick.

In small piers lay the brick on a bed of mortar and flush up solidly every course; in larger piers make a joint or rub on the bed and lay headers every fourth course. If bond stones are to be inserted the joints should not be too tight, say from three-fourths to an inch in thickness, the larger the pier the larger the joint, and bedded high in the middle, and in no case on the outer edges of the pier only. Use cement in all mortar in connection with lime, and wet the brick in all cases where there is not any danger from frost; where iron plates or cols set on bond stones, the plate should cover the bond stone as nearly as possible. The present custom of laying brick in dead walls gives one the impression that the quantity of work done is of far more importance than quality. The only way to obtain good solid brick walling is to either flush the joints solid with mortar every course, or make a shove joint; the former method takes too much time, and the latter is rarely done except in very heavy work.

The custom generally adopted is to spread the mortar on the brick (a portion only of which gets in the joints) and lay the brick on top, each succeeding course being bedded in mortar, but the longitudinal and cross joints are only partially filled. Grouting with cement mortar every two courses in height might be adopted for basements and first stories of buildings where unusual strength is required. Full headers for face brick are better than clipping and should be specified for all heavy buildings. The face brick are often built up fifteen or twenty courses high before the backing up is done, and thus the wall is never well bonded and sufficiently tied together.—*Building Budget.*

Sad as well as pleasing duties have to be met in the publication of a Journal, and to us, a notice of the death of Mr. Andrew Carrigan, of the Dunham, Carrigan & Hayden Co., who lately passed away is a truly sad one. During many years of business intercourse, his kindness of heart and nature, combined with strict business qualities, manifested themselves in numerous ways, and his loss cannot be other than a severe one—not only to those dear to him by the sacred ties of love, but to the firm of which he was an honored member, and the host of attachees and business and personal friends, who will miss him from their circle.

What Becomes of Our Saws.

IT is estimated that there are about 400,000 carpenters and joiners in the United States, and when we know the Disstons, of Philadelphia, employ 2,100 hands and turn out four hundred dozen saws a day, we are in a quandary to know what becomes of all the saws. True, there are about 150,000 people employed in the furniture trades, and perhaps 75,000 more as wheelwrights and millwrights, but, all who would be likely to use saws will not figure up more than one million; and suppose that each one of these workers should make use of five saws—say one rip-saw, one crosscut, one panel saw, one tenon and one compass—this would need about 5,000,000 saws to suit the wants of the workmen in the United States; but this does not cover the whole ground, for every house should contain at least two or three saws—a cut-off saw, a butcher's saw and a hack saw—thus swelling the needs to at least another million. Then there are the blacksmiths, the machinists, the plumbers, and a host of others who work in metals who require hack-saws and wood-saws of various kinds, which will probably foot up another million. There are also the gardeners, the saw mill men, the surgeons, the ship-builders and many other people who must have saws, and who probably require one million, so that it will not be stretching the matter at all if we say in round numbers it requires about ten million saws, of all sorts, to satisfy the needs of the 65,000,000 of people in these United States. So that after all, the 4,800 saws turned out daily by the Disstons do not do much more than make up for wear, breakages, losses and the new conditions that crop up with each new day.—*The Builder and Wood-Worker.*

New Work on Hand-Railing.

Nonpareil System of Hand-Railing. By John V. H. Secor, 5½x8½ inches. 78 pages. 157 line engravings. Bound in cloth. Price, post paid, $2.

Mr. Secor is a practical stair-builder of many years' experience, and has put into the little book on hand-railing, which he has just issued an exposition of those principles which he has long employed in his own work. The learner is led step by step from the simplest problem encountered in stair-building to those of the most complex character. The work is preceded by a glossary and is supplemented by a very complete index. A leading feature of the book is the method of ascertaining the length of the mold. The system of bevels presented is also simple and of universal application. The book is adapted to the needs of any one in the line of joinery who desires molds for any kind of stairs that may have been constructed. The cuts and text are placed side by side, and in all respects the book is arranged in a way to be attractive to the reader and useful to the student.

Nashville's Estimating Rules.

THE rules under which estimates in the building trades will hereafter be submitted in Nashville, Tenn., are given below as an example of the effect of concerted action in the direction of uniformity:

1. General drawings, when offered for final or competitive estimates, should be presented on a scale not less than one-eighth of an inch to the foot, and details not less than three-fourths of an inch to the foot. These should be done in ink or by some process that will not fade or obliterate, and be complete in all parts. Specifications should also be presented in ink.

2. The specifications, figured drawings, and details should be taken as the guide for estimating, and all demands made by the specifications or said drawings should be covered in the estimates offered, unless objection be made thereto in writing when the estimate is submitted.

3. Specifications should be plain and definite, and everything required in the various branches of work should be mentioned, described and grouped under appropriate headings—each trade to itself.

4. When the specifications require goods of a certain manufacturer, or material of a certain quality, the name and catalogue number of such manufacturer's goods, and the trade mark of such material, should be mentioned in the section to which such goods or materials belong.

5. Bills of quantities should be left to the intelligence of the contractor, and shall not be required of the architect.

6. Contractors should be responsible to each other for work damaged during the erection of the building.

7. When the contractor for the whole is to be restricted as to whom he shall employ as sub-contractors, that fact should be named in the specifications.

8. Contracts should be closed at some stated time, and no estimate should be considered if received after that time has expired.

9. Contracts should be awarded within ten days from the time of closing estimates.

10. Architects should invite to bid on the work only those from whom they desire an estimate on that particular job.

11. All bids received from those not invited should be excluded.

12. No contractor should make an estimate in an architect's office unless invited to do so.

13. When a contract involves the taking down or using the material of an old building, it should be fully set forth in the specifications.

14. No bids should be exhibited or made known by either architect, owner, or principal contractor before the time for closing estimates on the job.

15. No contractor should be allowed to alter or amend his bid after the time of closing estimates.

16. Contractors should decline to give estimates in the aggregate when bids are being received under the separate heads. Sub-contractors should also decline to give the architect or owner an estimate for his branch of the work when bids are being received for the work as a whole.

17. When the contract is to be completed within a certain time, that fact should be mentioned in the specifications, giving the date; and if a penalty for non-completion by the specified time is to be exacted it should be so stated.

18. The bidder to whom a contract is awarded should be required to sign a contract and furnish bond or withdraw his estimate.

19. The principal contractor should pay the sub-contractor in the same manner that the sub-contractor receives his estimates from the architect, when the work is let separately, to wit: 75 per cent. as his work progresses, and a final payment when his branch of the work is completed satisfactorily.—*Sanitary News.*

PLAN FOR A COSY COUNTRY COTTAGE.

A Cosy Country Home.

The above plan, with the elevation on opposite page, will, in furnished in the reality as shown by the engravings, be a more than ordinary cosy home. There is no attempt at elaboration in the elevation. Neatness has been the esential requirement. The plan meets all the requirements of a moderate sized family. If desirable a fine billiard room can be made in front part of basement. S. C. Newsom is the architect who has kindly furnished us the design.

Subscription price of this Journal is $2.00 per year. Examine the Contents of this Issue and see if it is not worthy of your support.

On Cutting Rebate.

BY DAVID DENNING.

IF the question, what kind of plane should be used to form rebates or rabbets with? were asked of two men, both workers in wood, but one of them a carpenter and the other a cabinet maker, the answers would probably differ. The carpenter would probably say a fillister, the cabinet maker a rabbet plane; perhaps going a step further, each would say the other was making a mistake. The inference which might naturally occur to the mind of the non-technical from such different opinions would be that either tool might be used, or that neither of the men knew what he is talking about. Parodoxical as it may seem, both these inferences are correct, for either the rabbet plane or the fillister may be used in making any ordinary rebate, and the man stating that one or otner tool should be used exclusively, could certainly know very little of the work to be done by the other.

How then does it happen, it may be fairly and properly asked, that two men, both presumably skilful in their own departments of joinery, one the cabinet making and the other the building, use different tools to effect the same result? The answer is simply because each finds the tool he advocates is the best for his own purposes. Ask a cabinet maker why he prefers a rabbet plane, and he will at once say that it is better for the comparatively small work he is generally employed in making. It is to the fillister what the smoothing is to the jack plane. Even the toiner will at once acknowledge that if a finely-finished rebate is wanted, the rabbet plane may be used with advantage, but only after the fillister has done its share of the work. The cabinet maker, on the other hand, will object to using the fillister at all, unless, indeed, on exceptional pieces of work or from personal idiosyncrasy. He will state that any advantages which may exist in the fillister are rendered useless from the account of labor required to force the cutter in front of the iron through hard wood—a piece of Spanish mahogany, for example. He is not far wrong, for though it would be incorrect to say that a rabbet could not be cut with a fillister—the side fillister in ordinary cases preferably—in hard wood no sensible man would voluntarily choose the tool which induces the greatest amount of fatigue when another would answer his purpose as well or better. In soft wood, such as the builder mostly uses, the fillister cuts well enough.

But, says this individual, only just look at the convenience of being able to "set" the fillister to any gauge, and the fence to serve as a guide; the rabbet plane is destitute of these, and with it the work cannot be so well done. What is there to keep the plane straight?

Well, skill assuredly counts for a good deal. If a man has been in the habit of working without a fence, he does not feel the need of it so much as another who has been trained to depend on it. Of course, a line to work must be marked in some way, with an ordinary gauge, for instance, or, where extreme accuracy is not required, by drawing with a pencil. Careful manipulation does the rest. As for the actual details, such as the mode of holding the plane and the use of accessory tools, they vary. One man will use the plough to form a groove to the required depth, another will be content with cutting gauge and chisel to remove a little of the waste wood before taking up the rabbet plane, while a third will simply rely on his fingers. Each, if he be intolerant of other ideas than his own, will claim his own method as the best, and doubtless it will be for him; but if he be a man of liberal mind he will at once say that there is no absolute best, and that it altogether depends on the custom of the worker.

It is rarely indeed that a good practical artisan, who has arrived at the years of discretion, has not found out which is the most convenient way for himself personally to use the ordinary tools of his craft. He may go to the length of telling youngsters who ask him which way he finds best, or even in friendly chat will discuss with others equally as competent as himself the pros and cons of various methods, but as for saying that every other but his own must be wrong—well, to do so would not reflect credit on his intelligence, but it might, and very likely would, be very strong presumptive evidence that his work would be that of a "duffer." Not that even such workers are not useul sometimes, so if any of them read these lines, and feel inclinod to take umbrage, perphaps they will kindly remember that the word is used in a Pickwickian sense, and that they are frequently to be relied on for doing whatever they have been accustomed to do—turning the grindstone, for instance, to the entire satisfaction of all concerned.

But, it may be inquired, do no workers fall into bad habits in their methods? do they invariably choose the best for their particuiar purpose? To answer this fully it would be necessary to consider many points in detail; but without by any means suggesting that absolute perfection exists in any workshop, professional or amateur, it may safely be conceded that most mechanics have a very fair idea of what suits them best. The cabinet maker and the carpenter can therefore very well agree to differ on cutting rabbets and the proper tools to use, remembering that to find fault with each other simply shows imperfect knowledge of the requirements of both trades, however competent one may be to express an opinion about his own. "Eh, mon, it's a graat peety that we canna a' think alike; but ah'll no change ma ain opeenion for that o' ony ither body." "Ma ain opeenion" is that it is at any rate rash to condemn other methods of tools if we do not know the reasons for them being used; and that occasionally, very occasionally, the least little bit of toleration of other people's mode of working might be better than done at all, or wholesale condemnation.—*American Workman.*

Builder's Association.

The Builder's Association have elected the following named to serve as officers for the ensuing term: President, S. H. Kent; Vice-President, M. C. Lynch; Recording Secretary, A. Jackson; Treasurer, W. B. Kreger; Executive Committee, J. Mahoney, C. C. Terrill, J. R. Wilcox, J. J. Dunn, R. K. Anderson, A. Norton, C. E. Dunshee, Financial Secretary, Louis Albert Larsen.

New Sheathing Lath.

Since the publication in our last issue of the method of placing the Byrkit Lath in position, we have received several inquiries in regard to the same. Architect Percy is using it in his fine $12,000 house which he is now having erected on Contra Costas fair shores. Full particulars may be had by addressing John F. Byxbee, No. 42 Market street.

Metrical Measures.

This term means a system by tenths, the same as we employ in computing common numbers, carrying one for every ten, or transferring from one division to another whenever ten, or a unit of the next higher division is reached. The metrical system means simply the application to lengths, volumes, weights, areas, and so on; the same rules we use in abstract numbers, and is only common sense applied to practical use; no matter if it is opposed by some people who rank high as those of judgment and learning.

This division of measures and weights into metrical or decimal units was first done in France, to the great credit of that nation, who are the "classifiers" of the world. An old European adage says: "The German people deduce, or draw conclusions, the French 'classify' and the English 'apply.'" This does not however, apply to the metrical system, the inception of which, as well as classification and application came from France.

Nearly all the countries of Europe, except England, have adopted decimal divisions, or the French metrical system. In the United States metrical divisions are legalized, but owing to English influence, some commercial reasons, and the opposition of people who do not "think," the system has made but little progress. In some cases we have been compelled to adopt it. The coinage of the country is decimally divided, so also are inches, because the absurd binary division into halves, quarters, eighths, sixteenths, and so on, while convenient enough for working purposes, does not answer at all for computation. The multiples for our lineal measure are independent of fractional quantities, 12, 3, 5½, 40 and 8, representing inches, feet, rods, furlongs and miles. In adding up lengths there has to be a distinct column for each of these divisions, and we first carry 1 in 12, then 1 in 3, next 1 in 5½, then 1 in 40. Could anything be more absurd? This is the "compound" addition and multiplication of our school books.

English money has to be written in three columns, each with a sign over it to indicateits place as pounds, shillings, and pence. The multiples are 4, 12, and 20, not counting farthings, four of which make a penny, but people's patience breaks down at farthings, and three columns only are used. Comparing this with dollars, cents and mills, or as we should say, dollars, dimes, cents and mills, the advantage will be seen. We set down a row of figures thus: $12345, it means "money;" the dollar sign qualifies all. If one figure is pointed off it becomes dimes, if two are pointed off they become cents, or dimes and cents. To divide by 10 we point off one figure; to divide by 100, two figures, and the sum, let it be what it will, is treated just the same as common numbers and decimals.

In the French metrical system there are employed short terms indicating the division as follows: *Milli*, 1000th part; *Centi*, 100th part; *Deci*, 10th part; *Deka*, 10 times; *Hekto*, 100 times; *Kilo*, 1000 times. The first three are below unity. Adding *Meter* to the term above, we have *Millimeter*, *Centimeter*, *Decimeter*, *Dekameter*, *Hektometer*, and *Kilometer*. These are the terms for measures of length, and take the following form:

Kilometer.	Hectometer.	Dekameter.	One. Meter.	Decimeter.	Centimeter.	Millimeter.
1000	100	10	1.	1.	.01	.001

To compare with this we will arrange a foot, the common British and American unit, in the same manner.

Mile.	Rod.	Yard.	Foot.	Yard.	Rod.	Mile.
5280	16½	3	1	.333	.0606	.00018

The utter absurdity of such a notion is apparent on its face, and no one attempts to defend it on other grounds than present expediency.

The London *Engineer* says such notation is "like a language," turns English measures into metrical to show it does not produce even fractions, with other "balderdash" not worth while to repeat. Mr. Coleman Sellers, of Philadelphia, is a champion of the English system, and among other commercial arguments against the metrical system, says machine patterns would be lost. Granting this to be true, which it is not, it would be much the same to say canal boats and stage coaches will be lost by building railways, hence railways should not be built. There are no scientific arguments worth repeating.

Our remarks and illustrations thus far relate to linear measures alone. The same thing, only in an aggravated degree, applies to other measures. Weight, volume and area are the same, a jumble throughout. The bushel is an illustration. There are nearly as many "bushels" as there are states in the Union California has happily got rid of this nuisance, and computes in most cases by quantities decimally divided.

We are not arguing for the immediate adoption of a decimal or metrical system, but to urge the readers of Industry, especially the younger ones, to learn the method and prepare for its adoption which is sure to come in future. There is a vast difference between admitting and understanding the results of a new thing, and adopting it.

National jealousy, we suspect, lies at the bottom of British opposition to metrical measures, and may have something to do with the matter here, but common sense should teach that science and learning have nothing to do with national lines, and opposition on such grounds is mere bigotry. At least one half the scientific literature of our time is written in metrical quantities, and not to be familiar with the method is a great impediment to understanding, practice and progress in those countries where metrical divisions are employed.—*Industry.*

Wastes of Society.

Fresh air is something which God has se' great value upon, but which most men think little of. In this is the heritage of health.

Architects seldom find an Owner of a Dwelling, who is willing to live, as God meant he should, by breathing *Fresh Air*, all for the sake of saving a few dollars, which ought to be expended in providing for Ventilation. Men of wealth pay more attention to the architecture and adornment of their homes, than to *proper ventilation.*

There is nothing more poisonous than the effluvia and exhalations that proceed from man.

In a close room where a family is assembled, they will, in twenty minutes, breathe the air over *once*—in another twenty minutes they will have breathed it *twice*—in another twenty minutes three times, and by that time every person in that room will have inhaled the effluvia from every other person in the room.

What wonder then that our streets are filled with wan-visaged men, women and children.

It is really lamentable to see people slowly and surely undermining their health, by persisting in building houses, without providing for *ventilation without draughts* (which can be had by the expenditure of a few dollars,) and thus sacrificing the greatest blessing heaven bestows upon man—by persisting in no ventilation or ventilation from Open Windows.

The Homes of the Rich and Poor alike should be ventilated by Abrahamson's Patent Ventilator without draughts.

NATURAL GAS seems to partake, at least, of one of the qualities of the manufactured article. A plumber in the city of Indianapolis went hunting for a natural-gas leak with a lighted lantern. He found the place. Result—he had a large funeral, and some contractor will soon have the job of rebuilding the house in which the leak was located.

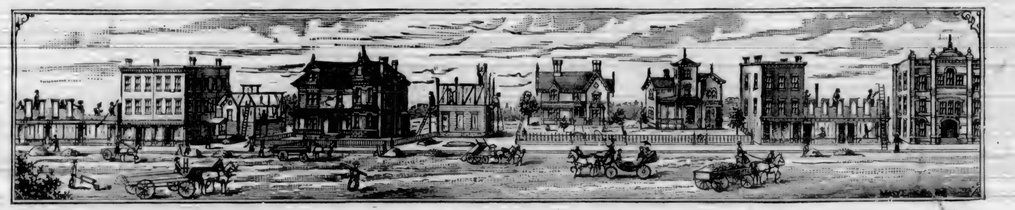
Modern Rural Homes.

A handsomely printed book, 7x11 inches, containing fifty-four plates of original designs in the latest modern architectural styles. The elevations are very picturesque. The book has been carefully prepared and is well worth the price set upon it, viz., $2.

ACADEMY
.....OF.....
Architecture and Building
3066 South Ninth Street,
ST. LOUIS, MO.

An Institute for Theoretical and Practical Education for Building Tradesmen. Completed within three courses. Terms begin September, December and March. Students may enter in any one of these terms. The Academy will always assist its graduates in obtaining positions as Draughtsmen, Superintendents, Foremen, etc. Send for Prospectus.

H. MAACK, Principal.



CITY BUILDING NEWS.

Alabama and Twentieth, one-story frame. Owner, P. Burns; architect, T. J. Welsh; contractor, G. Knopf; amount, $1,690; sureties, Charles Willhams & F. Kinkaid, $1,000; limit, September 1, 1889; $600, brown mortared; $500, completed; $690, 35 days; signed, June 18; filed, June 19.

Broadway and Clay, brick and carpenter work. Owner, W. S. Rainey; architect, T. J. Welsh; contractor, Blake & Powers; amount, $21,252; sureties, P. P. Riordan & J. J. McKinnon, $10,000; signed, June 17; filed, June 24; limit, 4 months; $3,000, foundation in; $4,000 exterior studding up; $5,000, brown mortared; $4,000, white mortared; $3,590, completed; $6,340, 35 days.

Bush street, No. 1715, additions. Owner, S. Waugenheim; architect, J. E. Wolfe; contractor, E. S. Libby; cost, $1,500.

Burnam near Twenty Fifth, two-story frame. Owner, Mr. Aulshek; cost, $1,600.

Buchanan near Haight. Additions to Protestant Orphan Asylum; contractor, G. H. Walker; cost, $2,500.

Broadway near Larkin. Additions; cost, $600.

Battery near California. Repairs to burned building; cost, $2,500.

Brannan, between Second and Third, move, etc. Owner, Jame. N. Killup; architect, J. M. Curtis; contractor, Wm. McDonald; amount, $8,045; limit, 70 days; signed, June 11; filed, June 15; 75 per cent, as work progresses; balance, 35 days.

Broadway near Franklin, three-story frame. Owner, Gustavius L. Spear; architects, Huerne & Everett; contractor, James Campbell; cost, $3,000.

Broadway, No. 327, two-story building. Owner, Mr. Checchezola; contractor, A. C. Rogers; amount, $1,900; signed, 26 June; filed, June 26; payments made as needed, balance when completed.

Broadway and Franklin, three-story frame. Owner, Gustavus L. Spear; architects, Huerne & Everett; contractor, James Campbell; cost, $4,595; signed, June 24; filed, July 1, $1,148.75; sheathed; $1,148.75, brown coated; $1,148.75, completed; $1,148.75, 35 days.

Capp and Twenty-Third, two-story frame. Owner, Isabella McCormick; architect, John J. Geary; contractor, Richard Doyle & Son; amount, $2,398; sureties P. F. Ward and Thos. Winters. $2 000; signed, June 24; filed, June 25; $700 brick work complete; $300 brown mortared; $740 inside finish done; balance, 35 days.

Clay, near Scott, building. Owner, Victor R. Ullman; architects, Salfield & Kohlberg; contractor, Wm. Plume; amount, $4,300, limit, 90 days; $1,100, framed; $600, brown coated; $500, white coated; $1,200, completed; $1,100, 35 days; signed, June 4; filed, June 4.

Clay, near Scott, painting, etc. Owner, Victor R. Ullman; architects, Salfield & Kohlberg; contractor, George Besthorn; amount, $290; $100, ready for grainer; $100, completed; $95, 35 days; signed, June 6; filed, June 6.

Connecticut and Napa, one story cottage. Owner, John Cullinane; architect, T. F. Mitchell; contractor, Timothy Sullivan; amount, $1,150; sureties, F. Joost and W. Thyark, limit 60 days; signed June 12 filed June 13. $287.50 framed; $287.50 brown mortared; $287.50 accepted; $287 50, 35 days.

California and Kearny, brick and iron building. Owner, F. G. Merchant; architect, Clinton Day; contractor, Peter Crichton; amount, $24,070; signed, June 27; filed, June 27; $5,500 walls up to second story; $4,000 walls up to third story; $4,500 brown mortared; $2,000 white mortared; $2,050 completed; calance, 35 days.

Clinton Park and Guerrero, two houses. Owner, Henry Hoffman; architect, Geo. Houston; contractor, Geo. Houston; amount, $5,870; limit, 100 days; signed, June 26; filed, June 26; $1,465 enclosed; $1,465 brown coated; $1,465 white coated; $1,475, 35 days.

California and Baker, carpenter work. Owner, Francis Crofts; architect, A. J. Barnett; contractor, C. N. Smith, amount, $4,340; surety, Frank P. Latson, $2000; limit, 90 days; signed, June 14; filed, June 18; $1,100, roof boards on; $500 brown coated; $900, white coated; $755 completed; $1,086, 35 days.

Clay, between Cherry and First, two-story dwelling. Owner, Thomas Langford; architect, John Gash; contractor, Jesse Rickard; amount, $3,290; signed, April 25, filed, June 29; $400 shingled; $400 brown mortared; $400 windows in; $400 two coats of paint on; $400 completed; $437 accepted; $813, 35 days.

California near Gough, two-story frame. Owner, B. A. Becker; architect, W. Mooser; contractors, Norton & Perry; cost, $14,000.

California and Gough, to build. Owner, B. A. Becker; architect, Wm. Mooser; contractors, Norton & Perry; amount, $9,500; sureties, A. W. Starbird and R. Goldstone, $5,500; signed, June 10; filed, June 11; 75 per cent. of work done, balance 35 days.

Clay near Scott, plumbing, etc. Owner, Victor R Ullman; architects, Salfield & Kohlberg; contractor, Fritz & Kean; amount, $368; signed, June 4; filed, June 6; $150 rough work is in, $218 completed.

Devisadero and Geary, three-story frame. Owner, John Friesenhausen; architect, Emil John; contractor, F. Kretzer; amount, $4,400; signed, June 13, filed, June 14; $800 framed; $800 partitions set in; $800 white coated; $900 accepted; $1,100, 35 days.

Douglas and Eighteenth, one-story frame. Owner, Jos. Oswald; contractor, August Disher; amount, $2,050; signed, June 18; filed, June 18; $500, framed; $500, first coat of plaster in; $500, completed, $550, 35 days.

Devisadero and Clay, alterations. Owner, Max Ordenstein; architect, J. Gash; contractor, G. Griffin; cost, $1,550; signed, June 18; filed, July 3; $600, ready to plaster; $400, plumbing done; $250, completed; $400, 35 days.

Dolores and Sixteenth, brick and carpenter work. Owner, P. W. Riordan; architect, T. J. Welsh; contractors, Blake & Powers; cost, $8,093; sureties, J. F. Lynch and T. J. Ford, $4,000; limit, 90 days; signed, June 17; filed July 2; $2,000, framed; $2,000, brown mortared; $2,000, white mortared; $2,093, 35 days.

Ellis and Franklin, two three-story flats. Owner, A. F. Knorp; architect, Emil John; contractor, Daniel Chisholm; amount, $12,900; signed, June 8; filed, June 12; $2,000 framed; $2,000 partitions set; $3,000 outside finish on, $2,675 accepted, $3,225, 35 days.

Ellis near Franklin, two, three-story frames. Owner, A. F. Knorp; architect, E. John; contractor, D. Chisholm; cost, $17,000.

Ellis near Mason; brick, stone and iron work for a five story brick and frame. Owner, C. M. Mason; architect, H. T. Beaton; contractor, John Wagner; amount, $6,947; signed, June 22; filed, June 26; 75 per cent. of value of work done as work progresses, balance of 25 per cent. 35 days.

Ellis and Franklin, plumbing and gasfitting. Owner, A. F. Knorp; architect, Emil John; contractors, Thos. Clark & Son; amount, $1,468; signed June 8; filed June 12; $500, rough work delivered, $600; accepted; $368, 35 days.

Ellis and Franklin, plastering. Owner, A. F. Knorp; architect, Emil John; contractors, Huntemann & Harper; amount, $1,799; signed June 8; filed June 12; $875 rough mortar on; $975 white mortar on; $475 white mortar on; $449, 35 days.

Ellis and Willow avenue, 2 three-story frames. Owner, A. F. Knorp; architect, Emil John; contractors, John Quadt; amount, $1,075; signed, June 8; filed, June 14; $400, ready for graining; $400; accepted; $275, 35 days.

Ellis near Mason, three-story frame building and basement. Owner, H. Matthews; architect, H. T. Beaton; contractor, C. E. Mason; amount, $25,330; signed, June 24; filed, June 25; $2,500 brick walls up; $4,800 framed; $2,800, floors laid; $3,800 brown mortared; $3,500, white mortared; $3,590 completed; $6,340, 35 days.

Folsom and Second, elevator work. Owner, Boyd & Davis, architect, J. M. Curtis; contractor, Cahill & Hall; amount, $4,045; limit, 90 days; signed, May 21; filed, June 12; $500 elevators are sunk full depths; $550 casings and elevator heads are in and guide posts up; $550 ready to deliver, balance, 35 days.

Fillmore and Broadway, additions. Owner, G. R. Sanderson; architect, H. D. Mitchell; days work; cost, $4,000.

Fell and Devisadero, plumbing, etc. Owner, J. B Mersing; architect, W. Winterhalter; contractor, John Bohn; amount, $825; $400, rough pipes in; $425, completed, signed, June 4, filed, June 4.

Fifth near Harrison, additional story; cost, $850.

Fourth corner Minna, three-story and basement, brick. Owner, M. A. Hampton; architect, G. A. L. Devlin; carpenters, Moore Bros; masons, Richardson & Gale; cost, $35,000.

Green, between Buchanan and Webster, to build complete. Owner, Harry W. Tuckey; architect, S. W. Hemenway; contractor, John Dyar; amount, $3,260; sureties, Jos. Peers and J. Muller, $800; limit, 161 days; signed, May 23; filed, June 26; 75 per cent on first day of each month, balance, 35 days.

Geary and Laguna, four frames. Owner, I. R. Hall; architect, Geo. E. Voelkel; contractor, F. Klatt; amount, $25,000; sureties, F. Joost and George T. Shaw, $25,000; signed, June 6; filed June 27; $2,000 first story joists on; $2,000 enclosed; $2,000 first coat of plaster on; $2,000 outside finish on; $2,000 second coat of plaster on; $3,000 ready to paint; $2,000 accepted; $10,000, 35 days.

Gough and Clay, to build. Owner, C. A. Belden; architects, T. C. Mathews & Son; contractor, R. P. Hurlburt; amount, $10,500; signed, June 6; filed June 12; $1,575, one-fifth done; $1,575, two-fifths done; $1,575, three-fifths done; $1,575, four-fifths done; $1,575 completed; $2,625, 35 days.

Gough near Clay, two-story frame. Owner, C. A. Belden; architect, W. J. Mathews; contractor, R. P. Hurlbut; cost, $12,000.

Golden Gate avenue and Webster street, three-story frame. Owner, Geo. Schaefer; architect, H. Geilfuss; contractor, L. M. Weismann; cost, $11,695; signed, July 2; filed, July 3; $1,4 0, framed; $1,450, roofed; $1,450, partitions set; $1,450, brown coated, etc.; $1,450, inside finish is on; $1,450, completed; $2,925, 35 days.

Golden Gate avenue and Lott street, two-story frame. Owner, Wm. Stafford; architect, John J. Clark; contractor, R. R. Thornton; cost, $3,454; limit 60 days; sureties, Harris & Jones, $2,578; signed, June 28; filed, July 2; $600, framed; $600, brown coated; $600, inside finish done; $654, 35 days.

Green and Fillmore, carpenter work, etc. Owner, Emma V. Foote; architect, Samuel Newsom; contractor, R. M. Murray; cost, $7,550; signed, June 26; filed, July 3; $1,132.50, framed; $1,132.50, roofed; $1,132.50, brown coated; $1,132.50, outside primed; $1,132.50, completed; $1,887.50, 35 days.

Howard near Fourteenth, two-story frame. Owner, M. J. Kain; cost, $5,000.

Hayes street, No. 714, additions Owner, C. Klopstock; architect, Curlett & Cuthbertson; contractor, Ingerson & Gore; amount, $2,550; signed, June 14; filed June 18; 75 per cent to be paid according as work is done, balance, 35 days.

Howard and Tenth, two tanks in Engine house. Owner, Omnibus Cable Company; contractor, J. C. Lamson; amount, $822; limit, August 1, 1889; signed, June, 15; filed, June 18; 75 per cent on completion, balance 35 days.

Hickory avenue, between Laguna and Octavia, frame building. Owner, J. W. Sims; architect, W. R. Sims; contractor, Henry Eide buttle; amount, $1,615; limit, July 1 '89; signed, April 24; filed, June 29. $200 rustic on; $100 brown coat d; $175 windows hung, etc., balance completed, also weekly payments $3 00 per day for each man on the work, until completed.

Hermann and Webster; two-story frame. Owner, Jacob Dobbelnar; architect, A. J. Barnett; contractor, John Ferness; amount, $3,788; surety, Frank P. Latson, $2,000; limit, 5 months; $741, roof boards on; $700, brown coated; $700, white coated; $700, completed; $947, 35 days; signed, June 1; filed, June 3.

Howard and Tenth, painting and glazing. Owner, Estate James Lick; architects, Wright and Sanders; contractors, Fraser & Keefe; amount, $2,495.75; 75 per cent. to be paid on first day of each month as work progresses; balance, 35 days; signed, May 6; filed, June 3.

Howard, between Fourth and Fifth, plumbing, etc. Owner J. F. Boyd; contractor, C. K. Cushman; amount, $2,375; $393.75, pipes in; $593.75 rough plumbing in; $593.75, finished; $593.75, 35 days; signed, May 28; filed, June 4.

Howard and Seventeenth, three-story frame. Owner, Wm. Doyle; architect M. J. Welsh; contractor, John Robertson; cost, $4,300; signed, July 29; filed, July 3; $1,000, framed; $1,100, brown mortared; $1,100, completed; $1,100 35 days.

Howard near Shotwell, twostory frame. Owner, F. W. Bunge; architect, H. Geilfuss; contractor, H. J. Weiss; amount, $8,195; signed, June 28; filed, June 28; $775 framed; $775 roofed; $775 partitioned; $1,275 outside completed; $1,275 inside finish on; $1,270 completed; $2,050, 35 days.

Larkin and Filbert, two two-story frames. Owner, Peter Scully; architect, Schmidt & Shea; contractor, John F. O'Brien; amount, $7,175; sureties, J. Peaco & Geo. O. Conrad; limit, 100 days; signed, June, 21; filed, June 22; $1,345, framed; 1,345, rough plumbing in; $1,345, primed; $1,345, completed; $1,795, 35 days.

Leavenworth near Jackson, brick and carpenter work. Owner, James P. Dunne; architect, A. J. Barnett; contractor, Richard McCann; amount, $8,460; sureties, Behrend Joost, $4 0 0; limit, 150 days; signed, June 22; filed, June 26; $2,000 roof boards on; $1,000 brown coated; $1,500 white coated; $1,000 outside finish up; $845 completed; $2,115, 35 days.

Leavenworth near Jackson, plumbing, etc. Owner, James P. Dunne; architect, A. J. Barnett; contractor, Fritz & Kean; amount, $1,067; limit, 110 days; signed, June 22; filed, June 28; $500 rough work done; $269 completed; $268, 35 days.

Lyon street, near Golden Gate avenue, one-story frame Owner, Chas. C. Morris; architect, R. O. Chandler; contractor, R. O. Chandler; amount, $2,200; signed, June 12; filed, June 14; $500 framed; $600 partitions set; $500 white coated; $600, 35 days.

Laguna, between Fell and Hayes, two, two-story frames; Owner, Mr. Winkelmann; contractor, M. Gorman; cost, $5,500.

COUNTRY BUILDING NEWS.

SEATTLE.

The work of rebuilding is pushed with energy. We are indebted to the *Post Intelligencer* for the report of work now in progress.

McNaught Bros., have engaged architect Boone, to prepare plans for a brick building to be erected by them on their property in the south east corner of Jackson and South Sixth streets. The ground floor will be divided into five stores with entrance on Jackson street. The three upper floors will be cut up in flats, and rented for tenement purposes. The building will be erected of brick, iron and stone, and work will begin as soon as plans are completed.

Mr. Sanderson is having plans drawns for a building to be erected on his property on Yesler avenue, between Commercial and South Second street. The building will be three stories high with basement. Work will commence on excavation for the basement at once.

Mr. J. Kenyon states that he will erect a brick building on his property on Commercial street, between Washington and Main. He will probably be joined by Messrs. McNaught and W. H. Maud, who own adjoining property.

The Gordon Hardware Company is preparing to go ahead with the construction of its building on its old site on Front street.

T. R. Hill has a force of men excavating on the site of the Oakland lodging house, on Commercial street, near Main. It is his purpose to erect a three-story brick, as soon as street lines and grade elevations are established by the council.

Mr. Chris Sherman will build on his property, situated on the northeast corner of Front and Cherry streets, as soon as the debris can be removed and the excavations made. The building will be built of brick, iron, stone and terra cotta, and will be a model structure. The dimensions are 60x120 and it will be three stories in height. The lower floor will divided into two stores.

Fisher, the architect, has about completed the plans, and the building will be completed inside of four months. The estimated cost is $30,000.

Architect Boone has completed plans for a frame building to be erected on the south side of Washington street, between South Sixth and Seventh streets, by Mr. S. Baxter. The building will be 60x120 feet in dimensions, and four stories in height. There will be three stores on the ground floor. The three upper floors will be divided into sixty rooms, for tenement purposes. Plans are also completed for a building identically the same in proportion, and to be used for the same purpose, which will be erected by Mr. S. Baxter on the east side of Front street, between Virginia and Lenora streets. These buildings will be put up at once.

The excavations for the Guy C. Phinney building on the northeast corner of Front and Seneca streets, are completed, and work on the building will commence to-day.

Architect Boone is preparing plans for rebuilding the Wah Chung building, situated on the north, east corner of South Third and Washington streets. The dimensions of the building as it formerly stood, were 60x45 feet. It will now cover 60x111 feet of ground and will be as originally, two stories high with a basement.

Whittier, Fuller & Co., will erect a building to cost $75,000.

On corner of Cherry and Third, Mr. Dexter Horner will ereet a four story brick building. Architect Boone has the plans about ready for same. Cost, $90,000.

Judge J. R. Lewis will erect a $20,000 building on Front street. Architect Nestor is preparing plans.

Engle & McElroy will have a $25.000 building erected from plans prepared by architect Nestor.

Architect E. H. Fisher is preparing plans for a four-story building for Mrs. L. A. Starr.

G. W. Young will erect a $10,000 building, the plans of which are being prepared by architect Nestor.

A Catholic church will be built ata cost of $25,000. Branigan and Ryan have the contract.

Architect Larkin has plans ready for a $6,000 building, for Mrs. M. A. Foster.

Architect Thomas will soon let contract for three houses for Mr. Glenn. They will cost $9,000.

SAN JOSE.

J. Lensen & Son are preparing plans for a three story brick and stone building for C. T. Ryland.

Two-story brick and frame business block. San Antonio between Third and Second streets. F. H. Trope, owner; J. Lenzen & Son, architects; Fuller & Cross, contractor; cost, $5800

One-story cottage in the Devendorf Addition. C. Warfield, owner; F. Davis, contractor; cost, $1710.

Two-story dwelling on the Davis tract. Prof. Cox, owner; Hazard & Lyth, contractors; cost, $2000.

Cottage in the Willows. Mr. Fleming, owner; Shottenhamer, contractor; cost, $2200.

Additions to a dwelling on Third street. Mr. McCabe, owner; J. Lenzen & Son, architects. J. D. Stewart, contractor; cost, $1200.

Dwelling on Fourth near Jackson street. A. Berryessa, owner; J. Lenzen & Son, architects; A. C. Bates, contractor; cost, $1100.

Dwelling house on Willow street. Mr. Ross, owner; Shottenhamer, contractor; cost, $1800.

Dwelling house on Vine street. M. Lenzen, owner; J. Lenzen & Son, architects; E. A. Van Dalsem, contractor; cost, $3000.

Two-story dwelling, Fifth near San Salvador street. Mrs. Burdett, owner; W. S. Boyles, contractor, cost, $3500.

Dwelling house corner Fourth and Reed streets. O. L. Bennett, owner; built by day work; cost, $3500.

ALAMEDA.

J. A. Leonard will erect three more dwellings on corner of Chestnut and Encinal avenue.

SAN FRANCISCO, AUGUST 15, 1889.

IT is not often that trade journals pay attention to matters entirely out of the line for which said journals were established. In the issue of July 27th, of the *American Architect*, will be found a very able editorial in regard to the late trouble in this City between the Musician's Union and the Military Authorities. It says:—"The Trades Union in San Francisco came into a collision with a force which they will probably find less amiable and easy of circumvention than the civil law. The 4th of July Committee offered $6 00 per day for each musician, instead of $8 00, the amount paid on previous occasions. The Musician's Union thereupon issued orders that none of its members be allowed to play on that day. It happened, however, that among the musicians who were expected to take part, were the members of the three regimental bands, who, although they belonged to the Musician's Union, were regular enlisted men in their several regiments of militia. Upon their failure to appear for duty, the colonels of their regiments took up the code of militia regulations to inquire into the duty, of enlisted musicians. As the officers concisely put the case "If some new-military body has more power over any part of the military force stationed in San Francisco than the commander-in-chief, it is a better time to learn it now than to wait till an emergency arises, and they or other similar societies array themselves against the law and the officers appointed to administer the same." The *American Architect* thinks a salutary example should be made of the first offenders for so gross a military fault.

(The findings of the Court Martial were very much in keeping with the spirit of the above extract, as the leaders were dishonorably discharged and a fine imposed besides. Appeal, however, is being prepared for executive clemency.—Editor *California Architect.*)

VALUE of sunshine.—A physician in New York reports, that during an epidemic of diphtheria in that city, there were five times as many cases on the shady side of the street as on the sunny side.

COMPETITION in laying artificial stone pavements has brought about the usual result. Low prices means the use of poor materials, not only in pavements, but in every thing else. Years ago, when cement sidewalks were first laid, people were slow to believe that they would last a quarter of a century and show but little wear from the thousands passing over them. Yet, there are pavements that have been used half of that time, on one of the most traveled portions of Kearney street, and the noticeable wear would not average an eighth of an inch. At that time, we believe, the price was about twenty cents per square foot. Numerous patents were taken out for various ways of laying the artificial stone pavement, and then the competition began. The price was reduced to 15 cents; then by one half of a cent at a time, down to 13 cts. This price was regarded as the very lowest that it was possible to lay a pavement. But still competition cut under that figure and walks have been laid as low as 10 cents a square foot. One enterprising individual on Market street, just below Sixth, used ashes instead of gravel in making the concrete bed. With a great flourish he proclaimed that his patent excelled them all, and $20,000 was wanted for the same for this city alone. It was but a few months after being laid, that the utter worthlessness of ashes instead of gravel was thoroughly proven, and a short time ago, it was necessary to replace the sidewalk entirely. It is so every time. Grind the price down to 10 cents, and you will have a 10 cent sidewalk. All over the city, sidewalks are crumbling to pieces that have been laid but a short time, many of them less than a year; while those put down by such men as Geo. Goodman, E. L. Ransome and a few others, have stood the test of more than 10 years, and the walks are as good to-day as when first laid. If property owners would consider that there is but $20 difference between a first class job and a 10 cent sidewalk, that one will last an ordinary lifetime, and the other but a few years, surely it would seem that no hesitation should be shown in choosing the better article. It is absolutely impossible to lay a good pavement at 10 cents, or even 12 cents, per square foot, and use gravel and cement as they should be used. Note how the cheap walks are laid. Gravel is used in the proportion of 1 part gravel and about 2 parts of earthy matter, the presence of which utterly precludes a good concrete for the foundation. Even with this cheap mixture, the contractor seeks to get off by making it not over an inch and a half in thickness. On top of this, a mixture of sand and cement is placed, and then the top is merely washed with a thin coating of cement. In one year the sidewalk is useless and people begin to condemn the cement sidewalk. Let owners figure on 15 cents per square foot for their pavements, give the laying of them to responsible parties only, and our word for it, they will never regret the difference in cost.

SO far the proceedings of the International Congress of Architects, whose sessions were held in Paris, commencing June 17, do not amount to much. A paper was read by M. de Baudot, the subject of which was "Teaching of Architecture." The views taken by the speaker, according to the *American Architect*, were unfavorable to the system pursued at the Ecole des Beaux-Arts, and he argued very effectively in favor of a more practical training for young architects, which should remove from them the reproach of being able only to make handsome water-color drawings. After the paper was read, considerable discussion ensued, the opponents of M. de Baudot's views being in a decided majority. By a little sharp practice, the Convention finally dodged the issue with great discretion, by adopting a resolution to refer the matter to the next Convention which is not likely to be held for another ten years, at least.

The only other matter of professional interest, was that of requiring architects to pass an examination and receive a diploma before allowing them to practice. Arguments, pro and con, were freely indulged in, and the Convention dodged the issue in the same manner as above.

San Francisco Chapter American Institute of Architects.

The regular monthly meeting of the Chapter was held in their rooms, 408 California St., on Friday, August 2d. W. P. Moore occupied the chair. There was a very good attendance of the members.

The following named were nominated for officers for the ensuing term: President, Seth Babson; Vice-President, G. W. Percy, W. J. Cuthbertson, W. P. Moore; Secretary, O. Everett; Treasurer, J. M. Curtis; Trustees, Wright, Pissis, Percy, Gash, Bestor, Moore.

Applications for membership were received from D. L. Williams and F. Williams, both of Portland, Oregon.

An amendment was offered to the By-Laws by which the night of meeting is to be changed to the second Friday of the month.

The members of the Technical Society were invited in from their meeting room to listen to a paper read by John Gash, entitled, "The Stone Age." The paper was well received by those present, and an interesting discussion ensued in regard to stone and the causes that lead to its deterioration.

The thanks of the Chapter were extended to the speaker for his able address.

The Mechanics' Fair.

ARRANGEMENTS are in active progress for the opening of the Mechanics' Fair on the 27th of the present month. It will last to October 5th. From the extent of the preparations made, the next exhibit will be superior to any its predecessors. We are in hopes that the exhibit of building materials, finished as well as raw materials, will be such as to command the attention of strangers. We understand the Chapter of Architects have a committee on this subject, who are working harmoniously with committees from other associations, and we trust their efforts will be successful. Especially is it desired to have a complete line of building stone from the various quarries all over the coast. These should be accompanied by a certificate of chemical analysis from some well known assayer or chemist. Mechanics should show what they can do and the one who produces the longest thick shaving, and the longest thin shaving should each be entitled to a medal. We will give our customary review of all articles connected with the building interests.

A Dwelling House Elevator.

VERY few people like to climb stairs. If such a thing were possible and practical as an elevator in an ordinary private house, costing to erect and operate not so much as to put it beyond the means of an average house-owner, it would undoubtedly be a boon. A Berlin inventor has proposed a plan of "a simple and inexpensive elevator for private dwellings," which is worthy of mention. It is on the principle of the inclined railway, and the motive power is furnished by the city water, which is applied in the cellar; each flight has its separate chair, so that, for example, one person can ascend from the first to the second story while another is on his way from the second to the third, or still another is descending from the fifth to the fourth. The chair, being only the width of a human body, requires but little space, and still leaves a free passage for any who wishes to walk up or down, instead of riding. It is set in motion by a simple pressure upon one of its arms, while after it has been used it slides back to the bottom step, its descent being regulated in such a manner that the carrying of a passenger is a matter of entire safety. The motive power is, of course, more or less expensive, according to the cost of water, this being, it is stated, in Berlin at the rate of a little more than one-tenth of a cent only for each trip.

They have a fire-brick trust in England. And yet Englishmen call this country the land of monopolies and trusts. Those who live in glass houses should not throw fire bricks.—*Western Architect and Building News.*

Away From Home for News.

AN extract from the *North-Western Lumberman* will be interesting reading to those on this coast connected with the interests represented. Truly we have to go away from home for news, but, in this case, the *news* is a series of mistakes:

"Pacific coast lumbermen have been behind the times in some respects, but they are beginning to adopt improved methods, and from now on they will doubtless manufacture and sell lumber to better advantage. The band saw is being established in that region, and the dry kiln is making its way. It seems singular that coast lumbermen should be so slow to adopt improvements demonstrated to be of great value in other parts of the country; but it is a fact that strong pressure was required to get the band saw introduced in the manufacture of redwood and fir lumber, and it is of comparatively recent date that the feasibility of drying redwood was recognized. About a year ago a few kilns were put in at Stockton, San Jose and other points, and a few months ago the first one was put in at San Francisco. Now they are going in quite numerously through California, Washington and Oregon. The advent of lumbermen from fields east of the coast has resulted in various innovations in operations, and continued improvements and increased energy may be looked for."

Etching Saw Blades.—Please inform me how saw manufacturers do fancy etching on the sides of steel saws? How could I put on a lion's head, with my name around the same?—B. A., Toronto, Ont.

Answer.—Saw manufacturers have the design and lettering engraved first on a copper plate by a competent engraver, by usual methods. This is done so as to read the same as the finished saw in appearance (not reversed, as printing-plates are done.) One or more impressions are then taken on a copper-plate press, with an ink that has had added to it some bitumen, or acid-resisting resin with beeswax. These impressions should be made on a thin, even paper, and the ink is afterwards transferred from this print on to a polished steel plate. Diluted nitric acid being put on the steel, the general surface is etched away, so that the letters and ornamentation stand up in relief instead of being sunk, as they are in the copper plate. The steel plate is then cleaned off, and is printed from in like manner to produce impressions for transferring to the saws. These impressions have the letters and ornamentation *white* on a black ground. If several impressions of the copper plate are transferred to the steel plate side by side, and etched, then each sheet printed from the steel plate will supply several transfers, when cut apart, for use on as many saws, thus economizing labor very considerably. If any of the transfers on steel or saw should be incomplete—not thoroughly protecting the surface, some asphaltum varnish, or shellac varnish with a little lampblack in it, can be applied with a camel's hair brush to the bare parts, to make them safe. The transfers on the saws are then etched, though not so deep as the first transfer on the plate, and the result is a duplicate of the original copper plate, with black letters, etc. Care must be taken to neutralize any traces of acid remaining on the saws when they are cleaned off, to prevent rusting after they are laid away. If this inquirer desires to decorate but one saw for himself, he must use ordinary methods of engraving. Cover the saw with an asphaltum varnish, draw through that with a steel point, or etching needle, the design he wishes, and then apply diluted nitric acid (acid, 1 part; water 4 parts) with a feather or camel's-hair brush until the design is etched black enough to suit him; wash off with water, then with turpentine, and lastly with soda solution. He will probably find it difficult to draw his lines just as he wishes them over the course grinding of the surface of the saw. —*Manufacturer and Builder.*

Architectural Picture-Making with Pen and Ink.

This book is handsomely illustrated with 32 large plates in size 12 x 18 inches. We have copies of this work on sale, which will be furnished at publishers price, $4.

Palliser's Quarterly for one year in conjunction with the California Architect, Price for the two $4.

DESIGN FOR CITY DWELLING—Huerne & Everett, Architects.

COUNTRY BUILDING NEWS.

SEATTLE.

The work of rebuilding is pushed with energy. We are indebted to the *Post Intelligencer* for the report of work now in progress.

McNaught Bros., have engaged architect Boone, to prepare plans for a brick building to be erected by them on their property in the south east corner of Jackson and South Sixth streets. The ground floor will be divided into five stores with entrance on Jackson street. The three upper floors will be cut up in flats, and rented for tenement purposes. The building will be erected of brick, iron and stone, and work will begin as soon as plans are completed.

Mr. Sanderson is having plans drawns for a building to be erected on his property on Yesler avenue, between Commercial and South Second street. The building will be three stories high with basement. Work will commence on excavation for the basement at once.

Mr. J. Kenyon states that he will erect a brick building on his property on Commercial street, between Washington and Main. He will probably be joined by Messrs. McNaught and W. H. Maud, who own adjoining property.

The Gordon Hardware Company is preparing to go ahead with the construction of its building on its old site on Front street.

T. R. Hill has a force of men excavating on the site of the Oakland lodging house, on Commercial street, near Main. It is his purpose to erect a three-story brick, as soon as street lines and grade elevations are established by the council.

Mr. Chris Sherman will build on his property, situated on the northeast corner of Front and Cherry streets, as soon as the debris can be removed and the excavations made. The building will be built of brick, iron, stone and terra cotta, and will be a model structure. The dimensions are 60x120 and it will be three stories in height. The lower floor will divided into two stores.

Fisher, the architect, has about completed the plans, and the building will be completed inside of four months. The estimated cost is $30,000.

Architect Boone has completed plans for a frame building to be erected on the south side of Washington street, between South Sixth and Seventh streets, by Mr. S. Baxter. The building will be 60x120 feet in dimensions, and four stories in height. There will be three stores on the ground floor. The three upper floors will be divided into sixty rooms, for tenement purposes. Plans are also completed for a building identically the same in proportion, and to be used for the same purpose, which will be erected by Mr. S. Baxter on the east side of Front street, between Virginia and Lenora streets. These buildings will be put up at once.

The excavations for the Guy C. Phinney building on the northeast corner of Front and Seneca streets, are completed, and work on the building will commence to-day.

Architect Boone is preparing plans for rebuilding the Wah Chung building, situated on the north, east corner of South Third and Washington streets. The dimensions of the building as it formerly stood, were 60x45 feet. It will now cover 60x111 feet of ground and will be as originally, two stories high with a basement.

Whittier, Fuller & Co., will erect a building to cost $75,000.

On corner of Cherry and Third, Mr. Dexter Horner will ereet a four story brick building. Architect Boone has the plans about ready for same. Cost, $90,000.

Judge J. R. Lewis will erect a $20,000 building on Front street. Architect Nestor is preparing plans.

Engle & McElroy will have a $25.000 building erected from plans prepared by architect Nestor.

Architect E. H. Fisher is preparing plans for a four-story building for Mrs. L. A. Starr.

G. W. Young will erect a $10,000 building, the plans of which are being prepared by architect Nestor.

A Catholic church will be built ata cost of $25,000. Branigan and Ryan have the contract.

Architect Larkin has plans ready for a $6,000 building, for Mrs. M. A. Foster.

Architect Thomas will soon let contract for three houses for Mr. Glenn. They will cost $9,000.

The * California * Architect * and * Building * News

VOLUME 10. ENTERED AT POST-OFFICE SAN FRANCISCO, AS SECOND-CLASS MAIL MATTER. ESTABLISHED JANUARY, 1879. NUMBER 8.

Official Organ of the San Francisco Chapter, American Institute of Architects.

NOW IN ITS TENTH YEAR.

Established Jan. 1879. Incorporated Jan. 1882.

COMPETITION in laying artificial stone pavements has brought about the usual result. Low prices means the use of poor materials, not only in pavements, but in every thing else. Years ago, when cement sidewalks were first laid, people were slow to believe that they would last a quarter of a century and show but little wear from the thousands passing over them. Yet, there are pavements that have been used half of that time, on one of the most traveled portions of street, and the noticeable wear would not average an f an inch. At that time, we believe, the price was enty cents per square foot. Numerous patents were t for various ways of laying the artificial stone pave- d then the competition began. The price was reduced to then by one half of a cent at a time, down to 13 cts. e was regarded as the very lowest that it was possible pavement. But still competition cut under that figure es have been laid as low as 10 cents a square foot. One ing individual on Market street, just below Sixth, used tead of gravel in making the concrete bed. With a rish he proclaimed that his patent excelled them all, 000 was wanted for the same for this city alone. It a few months after being laid, that the utter worthless- ashes instead of gravel was thoroughly proven, and a e ago, it was necessary to replace the sidewalk entirely. very time. Grind the price down to 10 cents, and you a 10 cent sidewalk. All over the city, sidewalks are g to pieces that have been laid but a short time, many less than a year; while those put down by such men as dman, E. L. Ransome and a few others, have stood the ore than 10 years, and the walks are as good to-day as t laid. If property owners would consider that there is difference between a first class job and a 10 cent side- t one will last an ordinary lifetime, and the other but a , surely it would seem that no hesitation should be choosing the better article. It is absolutely impossi- a good pavement at 10 cents, or even 12 cents, per ot, and use gravel and cement as they should be used. the cheap walks are laid. SAN FRANCISCO, AUGUST 15, 1889.

IT is not often that trade journals pay attention to matters entirely out of the line for which said journals were established. In the issue of July 27th, of the *American Architect*, will be found a very able editorial in regard to the late trouble in this City between the Musician's Union and the Military Authorities. It says:—"The Trades Union in San Francisco came into a collision with a force which they will probably find less amiable and easy of circumvention than the civil law. The 4th of July Committee offered $6 00 per day for each musician, instead of $8 00, the amount paid on previous occasions. The Musician's Union thereupon issued orders that none of its members be allowed to play on that day. It happened, however, that among the musicians who were expected to take part, were the members of the three regimental bands, who, although they belonged to the Musician's Union, were regular enlisted men in their several regiments of militia. Upon their failure to appear for duty, the colonels of their regiments took up the code of militia regulations to inquire into the duty, of enlisted musicians. As the officers concisely put the case "If some new-military body has more power over any part of the military force stationed in San Francisco than the commander-in-chief, it is a better time to learn it now than to wait till an emergency" arises, and they or other similar societies array themselves against the law and the officers appointed to administer the same." The *American Architect* thinks a salutary example should be made of the first offenders for so gross a military fault.

VALUE of sunshine.—A physician in New York reports, that during an epidemic of diphtheria in that city, there were five times as many cases on the shady side of the street as on the sunny side.

COMPETITION in laying artificial stone pavements has brought about the usual result. Low prices means the use of poor materials, not only in pavements, but in every thing else. Years ago, when cement sidewalks were first laid, people were slow to believe that they would last a quarter of a century and show but little wear from the thousands passing over them. Yet, there are pavements that have been used half of that time, on one of the most traveled portions of Kearney street, and the noticeable wear would not average an eighth of an inch. At that time, we believe, the price was about twenty cents per square foot. Numerous patents were taken out for various ways of laying the artificial stone pavement, and then the competition began. The price was reduced to 15 cents: then by one half of a cent at a time, down to 13 cts. This price was regarded as the very lowest that it was possible to lay a pavement. But still competition cut under that figure and walks have been laid as low as 10 cents a square foot. One enterprising individual on Market street, just below Sixth, used ashes instead of gravel in making the concrete bed. With a great flourish he proclaimed that his patent excelled them all, and $20,000 was wanted for the same for this city alone. It was but a few months after being laid, that the utter worthlessness of ashes instead of gravel was thoroughly proven, and a short time ago, it was necessary to replace the sidewalk entirely. It is so every time. Grind the price down to 10 cents, and you will have a 10 cent sidewalk. All over the city, sidewalks are crumbling to pieces that have been laid but a short time, many of them less than a year; while those put down by such men as Geo. Goodman, E. L. Ransome and a few others, have stood the test of more than 10 years, and the walks are as good to-day as when first laid. If property owners would consider that there is but $20 difference between a first class job and a 10 cent sidewalk, that one will last an ordinary lifetime, and the other but a few years, surely it would seem that no hesitation should be shown in choosing the better article. It is absolutely impossible to lay a good pavement at 10 cents, or even 12 cents, per square foot, and use gravel and cement as they should be used. Note how the cheap walks are laid. Gravel is used in the proportion of 1 part gravel and about 2 parts of earthy matter, the presence of which utterly precludes a good concrete for the foundation. Even with this cheap mixture, the contractor seeks to get off by making it not over an inch and a half in thickness. On top of this, a mixture of sand and cement is placed, and then the top is merely washed with a thin coating of cement. In one year the sidewalk is useless and people begin to condemn the cement sidewalk. Let owners figure on 15 cents per square foot for their pavements, give the laying of them to responsible parties only, and our word for it, they will never regret the difference in cost.

SO far the proceedings of the International Congress of Architects, whose sessions were held in Paris, commencing June 17, do not amount to much. A paper was read by M. de Baudot, the subject of which was "Teaching of Architecture." The views taken by the speaker, according to the *American Architect*, were unfavorable to the system pursued at the Ecole des Beaux-Arts, and he argued very effectively in favor of a more practical training for young architects, which should remove from them the reproach of being able only to make handsome water-color drawings. After the paper was read, considerable discussion ensued, the opponents of M. de Baudot's views being in a decided majority. By a little sharp practice, the Convention finally dodged the issue with great discretion, by adopting a resolution to refer the matter to the next Convention which is not likely to be held for another ten years, at least.

The only other matter of professional interest, was that of requiring architects to pass an examination and receive a diploma before allowing them to practice. Arguments, pro and con, were freely indulged in, and the Convention dodged the issue in the same manner as above.

San Francisco Chapter American Institute of Architects.

The regular monthly meeting of the Chapter was held in their rooms, 408 California St., on Friday, August 2d. W. P. Moore occupied the chair. There was a very good attendance of the members.

The following named were nominated for officers for the ensuing term: President, Seth Babson; Vice-President, G. W. Percy, W. J. Cuthbertson, W. P. Moore; Secretary, O. Everett; Treasurer, J. M. Curtis; Trustees, Wright, Pissis, Percy, Gash, Bestor, Moore.

Applications for membership were received from D. L. Williams and F. Williams, both of Portland, Oregon.

An amendment was offered to the By-Laws by which the night of meeting is to be changed to the second Friday of the month.

The members of the Technical Society were invited in from their meeting room to listen to a paper read by John Gash, entitled, "The Stone Age." The paper was well received by those present, and an interesting discussion ensued in regard to stone and the causes that lead to its deterioration.

The thanks of the Chapter were extended to the speaker for his able address.

The Mechanics' Fair.

ARRANGEMENTS are in active progress for the opening of the Mechanics' Fair on the 27th of the present month. It will last to October 5th. From the extent of the preparations made, the next exhibit will be superior to any its predecessors. We are in hopes that the exhibit of building materials, finished as well as raw materials, will be such as to command the attention of strangers. We understand the Chapter of Architects have a committee on this subject, who are working harmoniously with committees from other associations, and we trust their efforts will be successful. Especially is it desired to have a complete line of building stone from the various quarries all over the coast. These should be accompanied by a certificate of chemical analysis from some well known assayer or chemist. Mechanics should show what they can do and the one who produces the longest thick shaving, and the longest thin shaving should each be entitled to a medal. We will give our customary review of all articles connected with the building interests.

A Dwelling House Elevator.

VERY few people like to climb stairs. If such a thing were possible and practical as an elevator in an ordinary private house, costing to erect and operate not so much as to put it beyond the means of an average house-owner, it would undoubtedly be a boon. A Berlin inventor has proposed a plan of "a simple and inexpensive elevator for private dwellings," which is worthy of mention. It is on the principle of the inclined railway, and the motive power is furnished by the city water, which is applied in the cellar; each flight has its separate chair, so that, for example, one person can ascend from the first to the second story while another is on his way from the second to the third, or still another is descending from the fifth to the fourth. The chair, being only the width of a human body, requires but little space, and still leaves a free passage for any who wishes to walk up or down, instead of riding. It is set in motion by a simple pressure upon one of its arms, while after it has been used it slides back to the bottom step, its descent being regulated in such a manner that the carrying of a passenger is a matter of entire safety. The motive power is, of course, more or less expensive, according to the cost of water, this being, it is stated, in Berlin at the rate of a little more than one-tenth of a cent only for each trip.

They have a fire-brick trust in England. And yet Englishmen call this country the land of monopolies and trusts. Those who live in glass houses should not throw fire bricks.—*Western Architect and Building News.*

Away From Home for News.

AN extract from the *North-Western Lumberman* will be interesting reading to those on this coast connected with the interests represented. Truly we have to go away from home for news, but, in this case, the *news* is a series of mistakes:

"Pacific coast lumbermen have been behind the times in some respects, but they are beginning to adopt improved methods, and from now on they will doubtless manufacture and sell lumber to better advantage. The band saw is being established in that region, and the dry kiln is making its way. It seems singular that coast lumbermen should be so slow to adopt improvements demonstrated to be of great value in other parts of the country; but it is a fact that strong pressure was required to get the band saw introduced in the manufacture of redwood and fir lumber, and it is of comparatively recent date that the feasibility of drying redwood was recognized. About a year ago a few kilns were put in at Stockton, San Jose and other points, and a few months ago the first one was put in at San Francisco. Now they are going in quite numerously through California, Washington and Oregon. The advent of lumbermen from fields east of the coast has resulted in various innovations in operations, and continued improvements and increased energy may be looked for."

Etching Saw Blades.—Please inform me how saw manufacturers do fancy etching on the sides of steel saws? How could I put on a lion's head, with my name around the same?—B. A., Toronto, Ont.

Answer. Saw manufacturers have the design and lettering engraved first on a copper plate by a competent engraver, by usual methods. This is done so as to read the same as the finished saw in appearance (not reversed, as printing-plates are done.) One or more impressions are then taken on a copper-plate press, with an ink that has had added to it some bitumen, or acid-resisting resin with beeswax. These impressions should be made on a thin, even paper, and the ink is afterwards transferred from this print on to a polished steel plate. Diluted nitric acid being put on the steel, the general surface is etched away, so that the letters and ornamentation stand up in relief instead of being sunk, as they are in the copper plate. The steel plate is then cleaned off, and is printed from in like manner to produce impressions for transferring to the saws. These impressions have the letters and ornamentation *white* on a black ground. If several impressions of the copper plate are transferred to the steel plate side by side, and etched, then each sheet printed from the steel plate will supply several transfers, when cut apart, for use on as many saws, thus economizing labor very considerably. If any of the transfers on steel or saw should be incomplete—not thoroughly protecting the surface, some asphaltum varnish, or shellac varnish with a little lampblack in it, can be applied with a camel's hair brush to the bare parts, to make them safe. The transfers on the saws are then etched, though not so deep as the first transfer on the plate, and the result is a duplicate of the original copper plate, with black letters, etc. Care must be taken to neutralize any traces of acid remaining on the saws when they are cleaned off, to prevent rusting after they are laid away. If this inquirer desires to decorate but one saw for himself, he must use ordinary methods of engraving. Cover the saw with an asphaltum varnish, draw through that with a steel point, or etching needle, the design he wishes, and then apply diluted nitric acid (acid, 1 part; water 4 parts) with a feather or camel's-hair brush until the design is etched black enough to suit him; wash off with water, then with turpentine, and lastly with soda solution. He will probably find it difficult to draw his lines just as he wishes them over the coarse grinding of the surface of the saw. —*Manufacturer and Builder.*

Architectural Picture-Making with Pen and Ink.

This book is handsomely illustrated with 32 large plates in size 12 x 18 inches. We have copies of this work on sale, which will be furnished at publishers price, $4.

Palliser's Quarterly for one year in conjunction with the California Architect, Price for the two $4.

DESIGN FOR CITY DWELLING—Huerne & Everett, Architects.

A Tin Roof.

After the brand of tin has been selected for a roof, there yet remains the question of how it shall be worked by the tinner in forming the roof. Two leading styles of tin roofs are recognized. One of these is known as "Flat Seam," or "Flat Lock," roofing, and the other is designated by such terms as "Standing Seam," or "Standing Groove," roofing. These two styles are not necessarily in competition with each other, for one of them is particularly adapted to flat or level roofs, while the other is better for use on roofs having a considerable pitch. In some parts of the country, tinners do not seem to be acquainted with standing seam roofs at all, and use the flat seam on all occasions.

Flat seam roofs are laid by locking the sheets together on all four edges alike, and soldering, the result being one huge sheet covering the entire surface of the roof. As the sheets are laid, they are securely fastened to the roof by nailing through them under the edges turned up for the locks, or preferably by the use

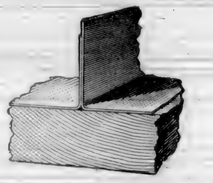

Fig. 4.—Edges of sheets turned up—first operation in laying a Standing Seam Roof.

of flat cleats. After laying, the seams are pounded flat and soldered. Such a roof is best for flat surfaces, but where a pitch of a half inch to the foot, or greater, can be obtained, better results are secured by laying the roof standing seam, which is illustrated in detail.

Standing seam roof is variously laid, and in the space of this pamphlet we can do no more than indicate the more common methods, and illustrate one of them. The sheets are first joined in the shop in long lengths by locking and soldering well on the upper side. The long strips are then rolled up and taken to the building. The strips are placed up and down the roof, and are united at their edges by the kind of joints that give the name to the style of roofing, namely standing seams. The construction of these joints is illustrated in figures 4, 5, 6, 7. Either of the sizes of sheets before mentioned may be used in a standing seam roof, and each of them may be worked in either of two ways; that is, either the wide or narrow way. Probably the larger number of standing seam rods, the country over, are laid the 20-

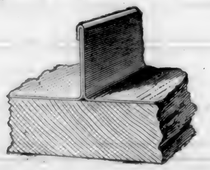

Fig. 5.—The high edge bent over the lower the second operation.

inch way of the sheets whichever size of plate is used. Different roofers prefer different methods, and in all cases more depends upon the intelligence with which the work is done than upon which way of the sheet the roof is laid, or of the size of the sheets. In the same way the height of the standing seam varies from $\frac{3}{4}$ of an inch minimum to $1\frac{1}{2}$ inches maximum. In the diagrams which we have introduced in this connection, we have employed the size of seams to which a large majority of tinners are accustomed to work.

STANDING SEAM ROOFS: 14x20 PLATES.

Many roofers claim that a better roof can be made of 14 x 20 plates than of 20 x 28. It costs a little more to lay a roof of the 14 x 20 size than it does of the 20 x 28 size, owing to the greater number of seams. In our estimation locality or custom has much to do with the use of the two different sizes. The 14 x 20 plates can be used for standing seam roofs in two ways. The more desirable way is by laying the sheets the 14 inch way, as illustrated in Fig. 1.

Using the tin in the manner shown in Fig. 1, as compared with the plan of working the sheets the other way about, requires more cleats and nails, as well as labor. The figures in the engraving represent the net surface of each sheet when laid the 14-inch way, and finished with a standing seam 1 inch in height. The cross locks are calculated $\frac{5}{8}$ of an inch wide.

PUTTING TIN TOGETHER.

Figure 2 shows how the sheets are formed and put together in lengths preparatory to laying them on the roof.

STANDING SEAM ROOF, 20 X 28 PLATES.

Figure 3 shows the appearance of a Standing Seam Roof laid, of 20 x 28 sheets, and represents the net surface of each sheet when laid the 20-inch way.

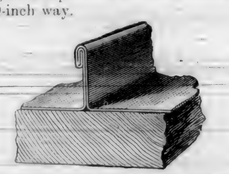

Fig. 6.—The top turned over the second time forming the double seam.

If two roofers figure to lay a roof of 20 x 28, and one lays it the 20-inch way he cannot lay it as cheaply as the one who would lay it the 28-inch way. But the 20-inch way makes the *better roof*.

ADVANTAGES OF A STANDING SEAM ROOF.

Where there is enough slope or fall to the roof, we recommend that the standing seam be used, and the same run down as far as within 5 inches of the level of the gutter water line, and that the cross seams be well soldered.

The advantage to be derived from the standing seam is an allowance for a greater amount of expansion and contraction than from the flat seam; as flat seams being soldered, make the entire roof practically a solid sheet.

We show in Figs. 4 to 7, inclusive, the method of making a standing seam. Fig. 4 shows sheets formed, or the edges turned up; Fig. 5 shows the first seam turned; Fig. 6 shows the seams double-locked and closed, and Fig. 7 shows the seams double-lock, closed, with paper under a standing seam roof, also showing cleat in finished seam.

CLEATS FOR A STANDING SEAM ROOF

Are made of tin about $1\frac{1}{2}$ wide by $4\frac{1}{2}$ long, and they should be placed at intervals of not more than 14 inches, and should always be used of style as shown in Fig. 8.

Two good sized barbed wire nails should be used for holding the cleat in place. Nailing through a single thickness of tin is not enough to hold the work in place. —Always cover the heads of the nails and prevent them coming in contact with the roof covering. These considerations give rise to the form of cleat illustrated in Figs. 8 and 9.

Empire Sheathing paper under a flat or standing seam tin roof, as under all metal roofs, is an advantage. Fig. 7 illustrates the

Fig. 7.—Paper under a Standing Seam Roof; also showing cleat in finished seam.

combination, and also shows the form of cleat illustrated in Figs. 8 and 9 in position.

GUTTERS.

Have the tin carefully put together, and the seams well soldered. Have the strips well cleated to the boards, and see that the gutters run up high enough to be above the water line. For gutters we recommend the IX thickness.

FIRE WALLS.

Have the Fire-Walls thoroughly covered with tin, which should be strapped or fastened to the walls every twelve inches.

SOLDERING.

We recommend the use of Rosin only as a flux in soldering,

and after soldering all Rosin should be carefully cleaned from the surface, otherwise it will appear after roof is painted." Half and Half" solder (a mixture of half tin and half lead) is the quality most suitable for roofing purposes.

100 square feet standing seam roofing should not take less than 3 pounds solder; 100 square feet flat seam roofing requires 7 pounds solder, which amount should be rigidly insisted upon to properly solder roof.

PAINTING THE ROOF.

The best paint for the purpose is composed of:—

7 pounds Prince's Metallic Paint, dry.
1 gallon Pure Linseed Oil ($\frac{1}{2}$ Boiled and $\frac{1}{2}$ raw.

The above amount will cover 500 square feet.

The substitution of Benzine or Fish Oils for the Pure Linseed Oil should not be allowed.

The roof will last longer and be less liable to rust if painted on the under surface before laying, and should be so painted in every instance. It should also have two coats of paint on upper side as soon as the roof is laid and soldered. It is a good plan to put one layer of Empire Sheathing paper under the tin to serve

Fig. 8.—Cleat with double nailing flange and cap.

as a cushion for same, and to deaden the noise made by the rain falling on the tin. This also prevents the annoyance of condensation on the under side, which frequently causes such a drip as to make it appear that the roof leaks.

A year after the first painting the roof should be painted again, and then a good roof will only require painting once in five years.

THE NUMBER OF SQUARE FEET A BOX OF ROOFING TIN WILL COVER.

For flat seam Roofing, using 1-2 inch locks, a box 14x20 size will cover about 192 square feet and for standing seam, using 3-8-inch locks, and turning 1 1-4 and 1 1-2 inches edges, making one inch standing seams, it will lay about 168 square feet.

For flat seam roofing, using 1-2-inch locks, a box of 28x20 size will cover about 399 square feet and for standing seam, using $\frac{3}{8}$-inch locks and turning $1\frac{1}{4}$ and 1 1-2 inches edges, making 1-inch standing seams, it will lay about 365 square feet.

Every box of roofing plates (IC or IX 14x20 or 20x28 sizes) contains 112 sheets.

Fig. 9.—Same cleat, with cap covering the nail heads.

SUGGESTIONS TO THOSE SPECIFYING TIN ROOFING.

In view of the foregoing, we would suggest to architects desiring to specify the best roofing tin and selecting our guaranteed brands, that the following precautions be taken in the wording of their specifications:

1st. That the name of the brand be written down in full, "Gilbertson's Old Method" or "Merchant's Roofing" or "Camaret."

2d. Every sheet to be stamped not only with the name of the brand, but also the thickness to be used—IC or IX.

If either of the above-named brands be used as a standard, and a cheaper brand be inserted in the same specification, there is, of course, little or no chance of our plates being used. Furthermore, after a specification has been so written as to allow inferior brands to be used—and very possibly the imperfect or waster sheets of same—and the roof commences to leak or show defects (as it would undoubtedly do in a short time), the specification is looked up, and our brands are condemned, when, in fact, they have never been used upon the roof in question.

We are prepared to prove that we were the first to introduce guaranteed plates and stamp every sheet with the name of the brand and thickness; and having also done away with the imperfect or waster sheets to further protect architects who wish to specify, and property owners who want to use the best, we feel that we have a right, under these circumstances, to ask that our guaranteed brands shall not be specified along with other brands in the market, which are inferior in quality, coating, weight and assortment.

We are at all times ready to afford any further information desired on this subject.

Samples of our "Gilbertson's Old Method" and "Merchant's Roofing" and "Camaret" brands of guaranteed Roofing Plates mailed on application. Merchant & CO., Philadelphia.

Mothers as Wage-Earners.

FOR years the world has been on a moral crusade against the employment of children in mines and factories, while the far greater evils that result from the mothers going out as wage-earners have attracted comparatively very little attention. Labor, within certain limits, is good for the child, giving it a wholesome moral discipline, and training it for the business by which it it is to earn its livelihood; but when a married woman has to neglect her natural duties for the responsibilities that properly belong to the other sex, it is time for humanity to protest in the name of her offspring. No one individual can fulfill satisfactorily the double or, I should say, the triple function of bearing and rearing children, and providing for their maintenance. I am a laboring woman myself, and have met with some success as a bread-winner; and I know the conditions of performing this function satisfactorily are quite incompatible with those arduous and important duties which make such heavy demands upon every conscientious mother, especially among the poor. In the homes of the very poor there are no hired servants to keep the household machinery running smoothly while the mistress is away. The wife of the laboring man is frequently cook, nurse, house-maid, laundress—all in one; and if she must go out as a bread-winner besides, what is to prevent the domestic engine from running off the track and getting itself hopelessly ditched?

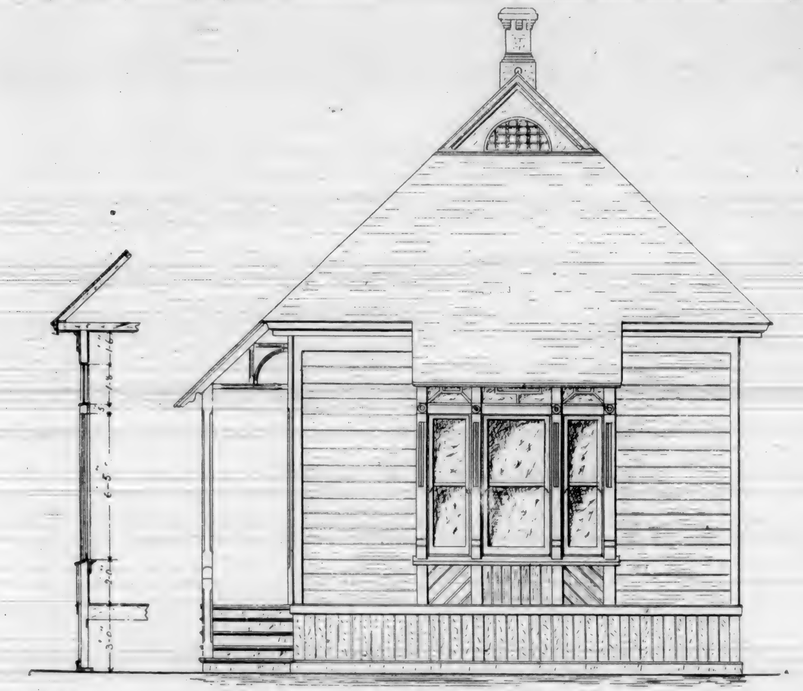
Of the two evils, if both are evils, I am persuaded that it is better that the child should go out to labor than the mother. Liberty, uncurbed by the check-rein of parental restraint, is a more than doubtful blessing for the loss of which the child that takes its mother's place in the shop or the mill is more than compensated by the advantage of having her care at home.—*Eliza F. Andrews.*

A Good Thing for Boys.

MANUAL training is one of the few good things that are good for everybody. It is good for the rich boy, to teach him respect for the dignity of beautiful work.

It is good for the poor boy, to increase his facility for handling tools, if tools prove to be the things he must handle for a living afterward. It is good for the bookish boy, to draw him away from his books. But, most of all, it is good for the non-bookish boy; it shows him that there is something that he can do well. The boy utterly unable, even if he were studious, to keep up in book knowledge and percentage with the brighter boys, becomes discouraged, dull and moody. Let him go to the work-room for an hour, and find that he can make a box or plane a rough piece of board as well as the brighter scholar, yes, very likely better than his brighter neighbor, and you have given him an impulse of self-respect that is of untold benefit to him when he goes back to his studies. He will be a brighter and better boy for finding out something that he can do well. Mind you, it is plaining the board in the presence of other boys who can no longer look down upon him when they see how well he can plane. He might go home after school and plane a board in the bosom of his family, or go to an evening school to learn to plane, without a quarter part, nay, without any of the invaluable effects upon his manhood that it will have to let him plane side by side with those who in mental attainments may be his superiors.—*Selected.*

We will send Palliser's Quarterly for one year (price $3.00) and the California Architect (price $2.00)—the two for $4.00.



A NEAT COTTAGE—Plan on Opposite Page.

Decomposition of Stone.

DR G. W. HAWES, in a report to the United States Government says: There are many more factors which determine the value of stone for purposes of construction than are often considered in the elementary treatises upon this subject, and the rules laid down are often determined by the local circumstances. A more extensive study of building stones frequently vitiates the rules which apply in limited areas. It is, for example, stated that, in order to determine whether a stone will withstand the action of the weather, one should visit the quarry and observe whether the ledges that have been exposed to the weather are deeply corroded, or whether these old surfaces are still fresh. This is not a fair criterion, because the applicability of such a test is modified by geological phenomena. North of the glacial limit, all the products of decomposition have been planed away and deposited as drift formation over the length and breadth of the land. The rocks are therefore in general, quite fresh in appearance, and possess but a slight depth of cad or worthless rock. The same classes of rock, however in the South are covered with the rotten products resulting from long ages of atmospheric action. They may be rotten to great depths, and the removal of the worthless rock is often difficult. This is due to the circumstances that no agencies have here operated to scrape off and remove the loose material from their surfaces in recent geological time.

There are other peculiarities of decomposition regarding which too absolute rules have been laid down. Pyrites is considered to be the enemy of the quarryman and constructor, as it decomposes with ease, and stains and discolors the rock. But here, too, there are features which very seriously modify the effect of this decomposing substance. Pyrites, in sharp, well defined crystals, sometimes decomposes with great difficulty. If a crystal or grain of pyrites is embodied in soft, porous, light colored sandstones, like those which come from Ohio, its presence will with certainty soon demonstrate itself by the black spot which will form about in the porous stone, and which will permanently disfigure and mar its beauty. If the same grain of pyrites is situated in a very hard, compact, non-absorbent stone, the constituent minerals of which are not rifted or cracked, this grain of pyrites may decompose and the products be washed away, leaving the stone untarnished.

Again, some of the constitutional elements of rocks are so frequently found in a decomposed condition that they are considered to be deleterious, when present in large quantity, on account of their well-known tendency to decompose. For example, olivine indicates a very marked tendency to decompose, as indicated by the vast accumulations of serpentine, which are so frequently found to be a result of its decompositions; but the circumstances which in past time has brought about this decomposition may have been very different from those which indicate that it will decompose under the present influences. We wish to bring prominently forward that we consider that a decision as to the probable action of the agents producing decomposition in rocks should be largely dependent upon careful microscopic examination of the structure of the rock. Our experience has demonstrated that a rock of a given character, as regards ultimate composition and mineral constituents, may be easily affected by the weather if its constituent minerals, as indicated by their microscopic structure, are so fractured that they are laid open to atmospheric agencies through rifts, no matter how small, while the same stone, with the same constituent minerals are sound, whole. and impermeable, as indicated by the microscopic structure.

In the old world, where immense cathedrals, planned long ago, have been in the process of construction for hundreds of years, it has not been uncommon to see portions of the building fall into decay before the structure was finished, and the process of restoration often consumes large sums of money while the process of construction is yet going on. It thus very frequently happen that a variety of stones is used in the construction of the same building, because in this process of construction experience is gained indicating inapplicabilty of the stone used for durable structures. In this case it is experience alone which finally dictates the most suitable material, and even to this day, here in America, there is no other criterion to apply to a building stone save the test of experience; and the result is that buildings can be pointed to which, like those old, immense structures before referred to, are already crumbling while yet in the process of construction.

Colors of Stone in Building.

A STUDENT of architecture in Boston, went to the professor of architecture in the Institute of Technology in that city and said: "Why is it that the new cathedral on Washington street has such a pale sallow look?"

"That is it," he said, "it is pale and sallow. The stone is of a grey color, not very light, neither very dark. The trimmings are of a whitish cast. Still there is not a great distinction between the two. This fact, as much as anything else, has to do with the failure on this great building."

The buildings of this country do not compare in artistic elegance with those of France or Germany. The reason is not on account of the amount of money expended, but is rather because of the lack of education of our architects. The mercantile rather than the artistic instincts are developed in a member of this profession. Not but that the artistic element is present to a certain extent, but so much of the business success of an architect is dependent upon his trade instincts that it often happens that the artistic development suffers through an enlargement of the importance of the business feature. Thus is it that very little attention has been paid to the proper blending and selection of color in building. Especially is this true where the color selections are depended upon the arrangement of materials as they naturally exist. This same grey stone that is used in the cathedral in Boston has been used successfully elsewhere through a different arrangement of color. The trimmings in some cases have been of brownstone, the grey of the body being affected advantageously thereby, and the brownstone itself being enriched by its contrast with the body color. This same greystone has been successfully used with buff Amherst sandstone and Nova Scotia stone. The result of the use of these warm tinted materials is that an agreeable contrast is afforded between the grey body stone and that of the trimming. The warmth of the trimming stone is emphasized by the cold grey tints of the main structure, and the latter is brought into agreeable effect through its association with other material. In one instance there is the neutral body and the enriched tone of the trimmings. It makes the difference between a building which is weak and flat in appearance and one which is vigorous, imposing and artistic.

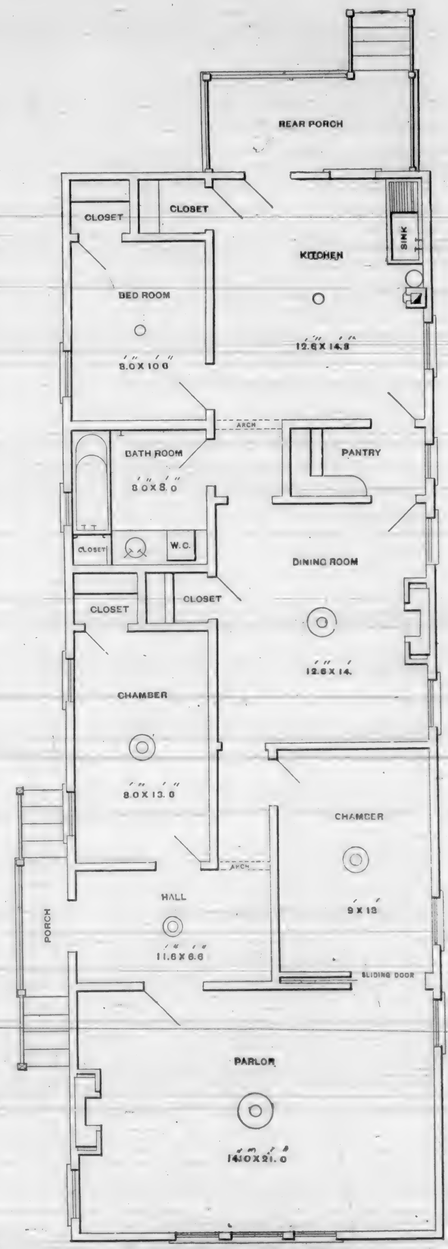
The union of brownstone trimmings with the grey granite body was a favorite combination with Mr. Richardson. He used it in the libraries at North Easton, Quincy and Woburn. Also in the city hall at Albany. It is much better to use a single tint of stone than two cold colors one of which will emphasize the weakness of the other. In the court-house at Pittsburgh, and the Chamber of Commerce at Cincinnati, grey stone is used exclusively, and the result is highly satisfactory. Relief is afforded by the carving and the recesses in the openings and by moldings, decorative and otherwise.—*Stone.*

A new building law in force at Berlin requires the submission of the plans of every building to the Government. Only two-thirds of the lot can be used for the building, which must not be higher than the width of the street. The stairs must be of stone. After the building has been finished it must lie idle for six months to let the walls dry. Then the health officer inspects the structure and decides how many people may sleep in each room.

Measuring Brickwork.

PROBABLY the best way to measure brickwork, in the opinion of an American writer, is by the dimensions. The unit of measurement in this case is not important. The cubic foot or yard is employed to some extent, but. the perch of 25 cubic feet and the superficial rod in brickwork one brick thick are often used. Unfortunately the term "rod" has no very definite significance. Two hundred and seventy-two and a half feet super, and one and a half bricks thick, 16½ feet square or 27½ square feet and one brick thick, 16½ square feet and 63 square feet, are all termed "rods." Under these circumstances it would probably be of advantage if the cubic foot or yard could be made, the standard unit of measurement for brickwork throughout the country.

It may be added that the number of bricks contained in any piece of built brickwork may be approximately ascertained by deducting one-tenth for the volume of mortar.



PLAN OF A NEAT COTTAGE.

☞ Note our offer for books in connection with California Architect—See page 115.

Remarkable Discoveries in Egypt.

The two large July gatherings held in London, England, by the Victoria Institute are considered to have been of much importance. The President, Sir G. G. Stokes, Bart., President of the Royal Society took the chair at both, and on each occasion the members crowded the large hall engaged to the doors. At the first meeting, Professor Sayce's account of his examination of the library brought by Amenophis III. from Assyria to Egypt 34 centuries ago, was given. The Lord Chancellor delivered an eloquent speech on the occasion, and M. Naville, the discoverer of Succoth-Pithom, Bubastis, and other places of great historical importance in Egypt, characterised the discovery described by Professor Sayce as one of the most important, and perhaps really the most important, of this century; and the Victoria Institute's members were not slow in recognising the value of their fellow-member's work. At the second meeting, the members assembled to welcome M. Naville on his arrival in England after his discovery of the site of Bubastis, and his exploration thereof. The business of this meeting was commenced by the election, as members, of several who had applied to join the Institute as supporters, including His Excellency Count Bernstorff, and several Australian and American associates, after which M. Naville himself described his own discoveries at Bubastis, for the first time in England,—his last visit to England having been previous to those discoveries. The Society of Arts have most kindly placed their apparatus at the disposal of the Victoria Institute, he showed, by lime-light, the photographs he had made on the spot.

M. Naville commenced by quoting the phophecy of Ezekiel against Egypt, because it contained the names of the leading buried cities, the recovery of the records of which he is so desirous to obtain; and here we may be permitted to digress for a moment to call attention to the fact that the authoress of the last published work in regard to the East declares that prophecy had not been fulfilled according to the prophet's words. Strange that the greatest and most successful Egyptian explorer of modern times should go to this very prophecy for light, to enable him to find that which others had failed to discover! Taking the last city named, he described how he found Pibsseth-Bubastis, how each day's excavating work brought him new relics, new inscriptions: how he found Rameses II., in the 19th dynasty, had as usual, blotted out the names of previous Pharaohs, and put his own name on everything, even on the statue of a Pharaoh of the 4th dynasty; and how, by careful comparison, aided by the fact that Rameses II. had not been quite thorough in his appropriations, he had discovered which Pharaoh of the 4th dynasty the statue represented. He came to the conclusion that Bubastis was founded at least as early as in the reign of Cheops, between whom and Pepi, of whose influence there were traces, 500 years intervened, 800 years after there was a transformation of the city in the 12th dynasty; in the 14th dynasty there was the invasion of the Hyksos or shepherds, who, from the statues of great beauty found, and from other evidences, must have been a highly cultivated people, who, he considered, must have come from Mesopotamia. Dr. Virchow considered that their monuments represented Turanians, and Professor Flower considered them to represent people of a Turanian or Mongoloid type, but that did not mean that the population itself was Turanian. Their worship and language was of a Semitic type, but the statues of their kings showed that they were not Semites. M. Naville added: "It was then what it is still now; and I believe that the conquest of Egypt by the Hyksos is not unlike what would happen at the present day if the population of Mesopotamia overran the valley of the Nile; you would have masses, in great majority of Semitic race, speaking a Semitic language, having a Semitic religion, and being under the command of Turks, who are not Semites but Turanians."

M. Naville, having referred to the head of a Hyksos King, which he had sent to the British Museum, added that he had found two statues of Apepi, the Pharaoh of Joseph, and inscriptions in regard to the Pharaoh of the Exodus, and many others of high interest. But it would be impossible to refer to the mine of interesting matter in this paper, and we can only congratulate the members of the Victoria Institute on possessing it: it is certainly worth the whole year's subscription to possess this one paper. M. Naville, in concluding, said: "I cannot dwell at great length here on the events of the Exodus, yet I should like to mention that the successive discoveries made in the Delta have had the result of making the sacred narrative more comprehensible in many points, and in one especially in showing that the distances were much shorter than was generally thought. I consider, for instance, it important to have established that Bubastis was a very large city, and a favorite resort of the king and his family. It is quite possible that, at the time when the events preceding the Exodus took place, the king was at Bubastis, not at Tanis, as we generally believed."

Sir George Stokes, Bart., having conveyed the thanks of the members to M. Naville, a short discussion took place, during which Captain Francis Petrie, the Honorary Secretary, pointed out that what Professor Sayce's paper has done as regards Assyrian and Babylonian history, M. Naville's had done as regards Egyptian history. They were papers advancing the practical work of the Institute in investigating philosophical and scientific questions, especially any questions used by those who unhappily sought to attack the Bible in the name of Science; and both would appear in the Journal, which would be presented at the Institute's Rooms, 1A, Adelphi Terrace, to all members and associates who were now on the list, or who might apply to join after the 10th of July. The President, members and associates then adjourned to the Museum, where refreshments were served.

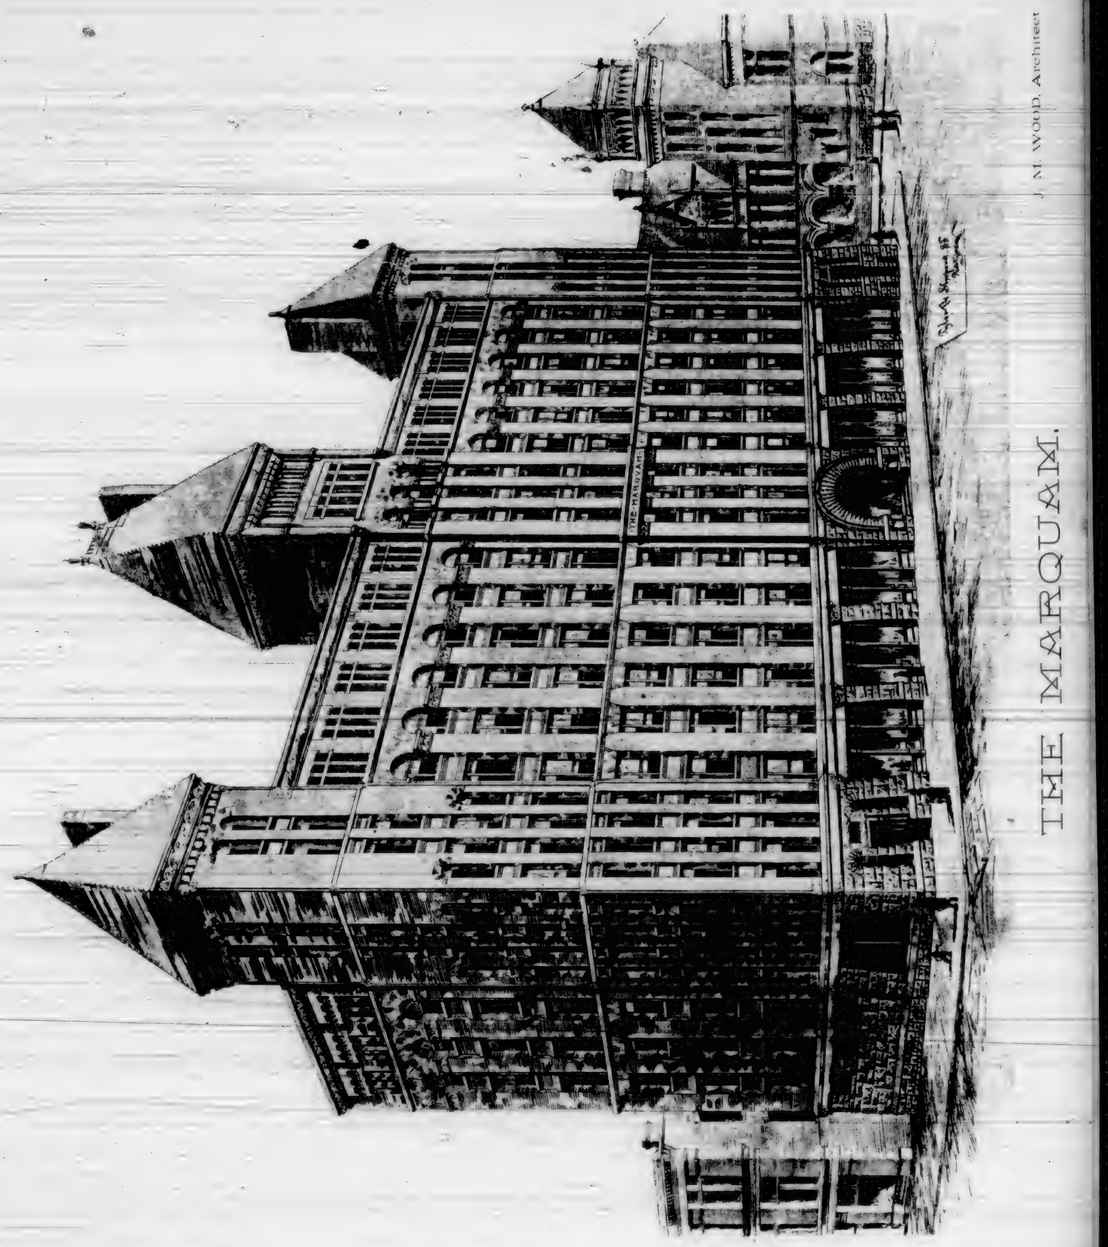
To Keep Iron Pipes From Rusting.

A SIMPLE and economical way of tarring sheet iron pipes to keep them from rusting is the following, suggested by a correspondent of the *Gas Light Journal*: The sections as made should be coated with coal tar and then filled with light wood shaving, and the latter set on fire. It is declared that the effect of this treatment will be to render the iron practically proof against rust for an indefinite period, rendering future painting unnecessary. In proof of this assertion the writer cites the example of a chimney of sheet iron erected in 1866, and which, through being treated as he describes, is as bright and sound to-day as when erected, though it has never had a brushful of paint applied to it since. It is suggested that by strongly heating the iron after the tar is laid on the outside, the latter is literally burnt into the metal, closing the pores and rendering it rust proof in a far more complete manner than if the tar itself was first made hot and applied to cold iron, according to the usual practice. It is important, of course, that the iron should not be made too hot, or kept hot for too long a time, lest the tar should be burnt off. Hence the direction for the use of light shavings instead of any other means of heating.

Don't Neglect The Plumbing.

A writer in the *Sanitary Engineer* says: At this season of the year it is usual for the man of the house to walk and carry himself with modest mien; if, under other circumstances, he might be bold enough to have something to say upon domestic affairs or utter a word of advice, he will find silence to be golden at the present; and why? Because for the last month house-cleaning has taken possession of what was once home; painters, calciminers, carpet-beaters, scrub-women, etc., jostle him rudely and look upon him with superb disdain as he meekly goes and comes. His wife, the partner of his joys and sorrows, seems a changed being, as, with a towel for headgear, she issues her imperious edicts. This is well, and in a sanitary point of view, much of it is necessary and beneficial; but usually it is but seldom that any thought is given to the plumbing or sewerage of the house. The plumbing, Tennyson's book is expected to run on forever. New curtains must be had, furniture upholstered, new carpets purchased, but not one thought is given the faithful servant that brings to the room the luxury of hot and cold water, the ever-ready basin, sink, bath, or closet—a luxury to the householder when in good health, a necessity when sick. The plumbing is left year after year without examination, repairs grudgingly allowed or not made at all, and this man who pays more for the carpet for the parlor than the origina' plumbing of his building cost, will be first to bewail the cost of needed repair. It never occurs to him that closets, traps, and waste-pipes, no matter how well adapted for the work, will in time need cleansing. Sewer connections may be broken by settling of the building, and that abomination authorized by the law and maintained by ignorance and incapacity, the disease breeder, the enlarged slop-pail in the yard, called the catch-basin, generating and belching forth the gases arising from its gathered filth—that needs cleansing, and needs it often.

It should be the mission of plumbers' associations to educate the people in this direction. The press will aid them. Here is work for their sanitary committees. The field is before them. Let this city take the lead.



Treatment of Ceilings.

The ceiling is perhaps the part of an apartment that calls most loudly for decoration, and no architectural feature is more susceptible of it, where it might be introduced with more effect, or give more pleasure to the inmate; yet this feature we almost invariably neglect. We naturally look up for beauty; however lovely the earth, the sky, both night and day, presents us with greater charms; we are cheered in our outdoor hours by its ever-changing picture, for which a flat white plane is a miserable substitute in our indoor life. To houses of the very highest class these remarks will apply, for it is a feature which has not had its due proportion of attention, in point of decoration, in any class of buildings, from the cottage to the palace. There certainly can be no more fitting place for decoration in the habitation of a being created upright. Can inconsistency be more extreme than that presented by thousands of apartments, where a rich, elaborately decorated carpet is under the feet, and a plain, dead, flat ceiling above? In the interior of Arabian buildings the ornaments almost invariably become richer, more delicate and minute, as their height from the floor increases, and the most exquisite productions of the artist are lavished on the ceiling. With respect to the form, the curve is at all times preferable to the flat, though the latter by various means is capable of great beauty also. No very great additional height is required in order to have a curved ceiling, as, whether coved or segmental, the rise need not be very great. For rooms of great pretension there is no form more noble and natural than the vault and dome, particularly the latter, whether hemispherical or segmental, as far as it suits the plan or can be adopted by pendentives or otherwise. It is the best substitute for the blue vault of the sky, the starry concave of the heavens. It was a fine idea of the builders of the mosque of St. Sophia at Constantinople —a conception in advance of ours—to make the curve of its dome so flat that it should seem to correspond with that of the sky, and be a portion of the firmament. We want an enlarged, improved, enriched, and at the same time inexpensive system of interior decoration, for domestic and ecclesiastical, commercial and other buildings, in our Anglo-Classic styles.

For churches, collegiate and other buildings in the Pointed style, we have examples in our cathedrals and other buildings, which prove that the genius of interior decoration was once among us, as well as the taste to employ it. At Henry the Seventh and King's College Chapels; the oratory at Beauchamp Chapel; the Temple Church; Wolsey's Hall, Hampton Court; Christ Church Hall, Oxford; Westminster Hall, and others, we have ceilings and roofs that might vie with any that Europe could show. For assistance in evolving a system of Classic decorations we might look to some parts of the Continent. Exterior decorations there has sometimes probably been carried too far, a few Continental edifices exhibiting ornaments so minute and fragile as to seem at least unfit for exposure to the weather in any climate. But this could not be said of interiors. The Moorish or Morisco-Spanish architecture suggests to us what richness might be produced by very simple means; their icicle pendents, inlays, and casings, and purely geometrical and imaginative ornaments, are very effective, and with them they often produce greater results than we, with all nature to imitate, have attained to. But the art of interior decoration was better understood and more successfully practiced in the great age of modern art in Italy, and indeed throughout the Middle Ages than at present in any country. We never had any decoration, to be compared with the mural and fresco paintings of the Italians, and there is probability in the supposition that their system was obtained from remains of the ancients, which time or violence has not spared to us. Beside the curved and richly emblazoned ceilings produced by the Italians, and the pictorial embellishment of their wals, ours might symbolize poverty itself. The ceilngs of the principal apartments of a Roman, Genoese, Venetian or Florentine palace were considered as most important features, and on their design and execution the highest talent was employed. In ecclesiastical buildings the contrast with ours would be still greater. Whilst the interior of the churches of Italy glow with every rich hue of the marble quarry, and are virtually galleries of art, what is the aspect of ours?—*London Architect.*

Subscription price of this Journal is $2.00 per year. Examine the Contents of this Issue and see if it is not worthy of your support.

Architectural and Mechanical Works.

In our list below will be found the names of books on architectural and mechanical subjects, the prices of which have been greatly reduced if taken in connection with the CALIFORNIA ARCHITECT. Old subscribers will be given the books at a large discount, so that they may feel that no favoritism is shown. It will be noticed that some of the books are given free to new subscribers.

	Price of Book.	With *Cal. Architect.*
Mechanics' Geometry	$5 00	$5 75
Monckton's National Carpenter	5 00	5 75
Cottages	1 00	2 40
Shavings and Saw Dust	1 50	2 75
Moore's General Assistant	2 50	3 25
Plaster and Plastering	1 00	2 40
Hand-Book of Legendary Art	3 00	3 75
Manual for Furniture Men	1 00	2 40
Water Closets	1 50	2 40
Cutting Tools	1 50	3 00
Sewer Gas and Its Dangers	1 25	2 50
Handrailing and Staircasing	1 25	2 75
Sloan's American Houses	1 50	2 75
Amateur Mechanic's Workshop	1 50	3 00
American Cottage Builder	3 50	4 00
Wheeler's Rural Homes	1 50	3 00
Burns' Ornamental Drawing	1 00	2 40
Manual of Drawing for Carpenters	3 00	4 00
Steam Engine Catechism	1 00	2 40
Grimshaw on Saws	4 00	4 75
Modern Low-Cost Houses	50	2 00
A Cosy Home	25	2 00
California Picturesque Architecture, No. 1	3 00	4 00
California Picturesque Architecture, No. 2	3 50	4 25
The Artisan	5 00	5 75

The following are justly recognized as standard publications. Some of them are perfectly new works, but we make the same general reduction:

	Price of Book.	With *Cal. Architect.*
Tredgold's Carpentry	$7 50	$8 25
Building Construction, 3 vols	14 00	14 75
Picture-Making with Pen and Ink	4 00	5 25
New American Architecture (Palliser's)	4 00	5 25
Palliser's New Quarterly, per year	3 00	4 00

We can furnish any book printed at publishers' prices, and will send all books free by either mail or express.

PLASTERING by a new process of hardening so as to make it available for the construction of floors in place of wood, has been brought before the French Academy of Science by M. Jute, says an exchange. A mixture of six quarts of plaster of good quality and one part of finely sifted, recently slaked white lime is employed like ordinary plaster. After it has become thoroughly dry, the object manufactured from it is saturated with a solution any sulphate whatever whose base is precipitated in an insoluble form by lime. The sulphate especially recommended for the purpose are those of iron and zinc. In order to obtain the maximum of hardness and tenacity it is necessary to temper the limed plaster well in as brief a space of time as possible, and with no more water than is strictly necessary.

ACADEMY
.....OF.....
Architecture and Building
3066 South Ninth Street,
ST. LOUIS, MO.

An Institute for Theoretical and Practical Education for Building Tradesmen. Completed within three courses. Terms begin September, December and March. Students may enter in any one of these terms. The Academy will always assist its graduates in obtaining positions as Draughtsmen, Superintendents, Foremen, etc. Send for Prospectus.

H. MAACK, Principal.

In proportion to circulation, a *Class Journal* is worth far more to advertisers than the daily papers. As a rule, they charge high prices for advertisements, but their circulation reaches those who are most benefitted. Many people take the *California Architect* for the advertisements, knowing they give an account of all the latest improvements. Hence, all those who desire to bring prominently their wares before the buying public, should at once insert their ads in the column of this Journal.

CITY BUILDING NEWS.

Ashbury near Franklin, two-story frame. Owner, E. N. Harmon; architect, Cupeland and Pierce; contractor, J. G. Adams; cost, $6,585; signed, July 12; filed, July 15; limit, 90 days; cost, $1,200 framed; $1,900 outside finish on; $1,085 completed; $1,400, 35 days.

Bryant avenue near Twenty-fifth street, two one-story frames; Architects, Salfield and Kohlberg; contractor, Tho. Elam; $6,500.

Broderick and Clay, plumbing, etc. Owner, W. S. Rainey; architect, T. J. Welsh; contractor, W. F. Wilson; cost, $1,498; signed, June 17; filed, July 9; $500, roughed on; $398, completed; $400, 35 days.

Broderick and Clay, painting, etc. Owner, W. S. Rainey; architect, T. J. Welsh; contractor, M. J. Donovan; cost, $1,200; signed, June 17; filed, July 9; $300, primed; $300, first coat of varnish is on; $300, exterior is second coated; $300, 35 days.

Bryant near Decatur, two-story frame. Owner, T Derham; architect. M. J. Welsh; contractor, Aug. Discher; cost, $4,750; signed, July 17; filed, July 18; $925, framed; $925 brown coated; $925 completed; $975 35 days.

Brannan near Third, three-story frame.. Owner, A. W. Mogenstern; architect, H. Geilfuss; contractor, H. J. Knapp; cost, $6,150; signed, July 25; filed, July 27; $660 basement walls up; $660 framed; $660 roofed; $660 partitions set; $660 brown mortared; $660 white mortared. $650 completed; $1,540. 35 days.

Bay near Powell, carpenter work. Owner, Britton & Rey; architect, H. C. Macy; contractor, Jas. M. Kelley; cost, $13,196; signed, July 17; filed, July 19; 75 per cent. as work progresses, balance, 35 days when completed.

Broderick near Hayes, to build. Owner, Pauline Fahey; architects, Salfield & Kohlberg; contractor, R. H. Ely; cost, $1,580; sureties, Bennett Bros. and J. T. C sgrove; $1,000; signed, July 12; filed, July 22; limit, 60 days; $580 brown coated; $600 completed; $400, 35 days.

Bay near Powell, brick-work etc. Owners Britton and Rey; architect, H. C. Macy; contractor, Geo. D. Nagle; cost $3,014; signed, July 15; filed, July 19; 75 p r cent. as work progresses; balance, 25 per cent when completed.

Bryant near Twenty-fifth, to build. Owner, Mary Grotheer; architects, Salfield & Kohlberg; contractor, Thos. Elam; cost, $5,100; sureties, Chas F. Doe and W. A. Meeker; $2,100; signed, July 30; filed, August 1; limit, 60 days; $1,400 framed; $1,900 partitions set; $1,225 completed; $1,275, 35 days.

Capp near Twenty-second, shooting. Owner, R. P. Sanchez $800.

Clay and Leavenworth, two, two-story frames. Owner, Jos. Wolf; architects, John & Balrzynski; contractor, F. V. Steinmann; cost, $10,550; signed, July 22; filed, July 24; $2,000 framed; $2,000 partitions set; $2,000 outside finished; $1,912 50 completed; $4,637 50, 35 days.

Clay and Leavenworth, plastering. Owner, Jos. Wolf; architects, John & Bairznski; contractor, Arthur O'Brien; cost, $1,195; signed, July 22; filed, July 24; $500 rough mortared; $400 white mortared; $295, 35 days.

Clipper near Sanchez, one story frame. Owner, P. A. McDonald; architect, M. J. Welsh; contractor C. Peterson; cost; $1,400; signed, July 16; filed, July 17; $350 framed; $350 brown coated; $350 completed; $50, 35 days.

Clay near Polk. Additions. Cost, $1,200.

Castro and Eighteenth, five frame buildings. Owner, W. Fredricks; architect, W. Mooser; contractors, Plumm & Martin; cost, $18,500.

Clay and Leavenworth, plumbing, etc. Owner, Jos Wolf; architects, Jonn & Balrzynski; contractor, Louis Huf; schmidt & Bros; cost, $1,320; signed, July 22; filed, July 24; $850 rough work is done, $440 accepted, $330, 35 days.

Castro and 18th, five frames. Owner, M. Frerichs; architect; Wm. Mooser; contractors, Plumm r & Martin; cost, $17,500; sureties, Frederick Kniffl ich, $10,000; signed, July 24; filed, July 24; 75 per cent. as work progresses, balance, 35 days.

Castro and Twenty-fifth streets, alterations; Owner, John H. Delamore; architect, Townsend & Wyneken; contractor, P. J. Collins & Son; cost, $1,272; signed, July 16; filed, July 19; $354 brown coated; $300 most outside done; $300 completed; $318 36 days.

Ellis near Mason, plumbing etc. Owner, H. Matthews architect, H. T. Bestor; contractor, John T. Gray; cost, $2,175; signed, July 31; filed, August 2; $900 rough work in $725 completed; $850 35 days.

Eddy and Van Ness avenue, plumbing, etc. Owner, Isabella M. Kane; architects, Schulze & Meeker; contractor, Wm. F. Wilson; cost, $8,947; sureties, G. P. Ayers and James Conlin. $1,500; signed, July 17; filed, July 20; limit, Dec. 11, '89; $1,500 rough pipes in; $1,457 completed; $990, 35 days.

Ellis and Webster, three, two-story frames. Owner, Lang Bros; architects, John & Balrzynski; contractor, Wm. Plume; cost, $10,250; signed, July 23; filed, July 24; $2,000 framed; $2,000 partitions set; $1,700 outside on; $2,000 accepted; $2,550, 35 days.

Ellis near Webster, plumbing, etc. Owner, Lang Bros. architects, John & Balrzynski; contractor, F. Koch; cost, $1,200; $450 rough work is in; $450 accepted, $300, 35 days.

Ellis and Polk streets, building. Owner, Wm. John; architects, John & E lrzynski; contractor, F. W. Kern; cost, $6,900; signed, July 17; filed, July 17; $1,000 framed; $1,500 partitions set; $1,175 outside finish on; $1,500 ready for painting; $1,725, 35 days

E. one-half lot 25 block 27 Fairmount Homestead Association, one-story building. Owner, Frank T. Barris; architect; T. F. Mitchell; contractor, Thos. F. Mitchell; cost, $1,440, signed, July 6; filed, July 10; limit, September, 15; $360 framed; $360 brown coated; $360 completed; $360 35 days

Eighteenth, near Guerrero, one-story frame. Owner, J s. F. Schuppert; architect, A. C. Lutgens; contractor, Jos Kennedy; cost, $2,910; signed, July 11; filed, July 12; limit, sixty-eight days; $600, roof ready to board; $960, first coat of plaster is on; $400, second coat of plaster is on; $682.50, completed; $727.50, thirty-five days.

Eleventh, near Harrison, one-story building. Owner, Hanna Doyle; architect and contractor, Thos. F. Mitchell; cost, $1,359; signed, July 6; filed, July 10; limit, Sept. 15, 1889; $337.50, framed; $337.50, brown coated; $337.50, accepted; $337.50, 35 days.

Ellen near Scott, alterations, etc. Owner, Kate King; architect, M. J. Welsh; contractor, E. Stroth; cost, $2,950; signed, July 25; filed July 30; $737 50 first story framed; $737 50 brown coated; $737 50 completed; $737 50, 35 days.

Eddy and Van Ness avenue, five two, and one three-story frames. Owner, Isabella M. Kane; architects, Schulze & Meeker; contractor, Fred. E. Libby; cost, $30,897 75; sureties, C. C. Rohlffe and C. A. Warren, $11,000; signed, July 9; filed, July 20; limit, Dec. 1, '89; $3,615 rough framed; $3,000 floors laid etc; $9,675 outside done; $4,010 25 second coat plaster; $5,348 completed; $7,724 50, 35 days.

Ellis, near Franklin, three-story frame. Owner, Albert Knorp; architects, John & Balrzynski; contractor, Dan Chisholm; cost, $5,200; signed, July 8; filed, July 9; $1,000, framed; $1,000, floors laid, etc.; $1,000, white coated; $900, accepted; $1,300, 35 days.

Folsom and Twelfth, three-story frame. Owner, Bernard S hmidt; architects, John & Balrzynski; contractor, F. W. Kern; cost, $6,140; signed, July 9; filed, July 9; $1,000, framed; $1,200, floors laid, etc.; $1,200, outside finish on; $1,295, accepted; $1,585, 35 days.

Filbe t, near Mason, brick and carpenter work. Owner, W. Block; architects, Salfield & Kohlberg; contractor, Louis Weisman; cost, $5,900; sureties, John Diemer and John Staude, $5,900; signed, June 26; filed, July 9, limit, 65 days; $1,500, framed; $1,400, brown coated; $1,500, completed; $1,500, thirty-five days.

Filbert, near Mason, plumbing, etc. Owner, W. Block; architects, Salfield & Kohlberg; contractor, Thos. Clark & Sons; cost, $660, signed, June 28; filed, July 9; $300, rough work done; $385, completed.

Filbert, near Mason, painting, etc. Owner, W. Block; architects, Salfield & Kohlberg; contractor, J. A. Kemp; cost, $486; signed, June 28; filed, July 9; limit. 14 days; $250, two coats of paint are on; $235, completed.

Filbert near Dupont, to build a frame and a tering three frame buildings. Owner, G Torre et. al.; architect, Wm. Mooser; contractor, J. B. Cavaglia; cost, $8,500; sureties, G. Rocca and G. Cappeser, $5,000; signed, July 15; filed, July 16; 75 per cent as work progresses; balance, 35 days.

Fleury near Noe, three-story frame. Owner, Karl Clundt; architect, Caspar Zwierlein; contractor, Caspar Zwierlein; cost, $8,000; signed, July 22; filed, July 30; $1,250 enclosed; $1,250 brown coated; $1,250 white coated; $1,250 completed; $3,000, 35 days.

Fourteenth corner Harrison, repairs to three two-story frames Owner, B. Leddy; day's work, $2,500.

Folsom and Twelfth streets, two-story frame. Owner, Henry Meyer; architect, A. C. Lutgens; contractor, Arthur J. Ahern; cost, $4,000; sureties, Wm. A. Meeker, $3,000; signed, July 18; filed, July 19; limit, 80 d ys; $700, framed; $750 first mortar; $750 second mortar; $800, completed; $1,000 35 days.

Guerrero and 24th, alterations, etc. Owner, F. M. Bryne; architect, B. K. Henriken; contractor, A. C. Hussey; cost, $1,600; signed, July 16; filed, July 23; $300 lathed; $450 sashes hung; $450 tr mmings hung; $400, 35 days.

Guerrero near Fourteenth street, two two-story frames. Owner, Charlotte A. Lynch; architect, A. J. Barnet; contractors, Brennan Bros.; cost, $4,867; sureties, Frank P. Latson & J. J. McKinnon, $5,000; signed, July 18; filed, July 19; limit, 90 days; $2,250, roof boards on; $2,000, brown coated; $2,000, first floor is on; $1,000, completed; $2,417, 35 days.

Grove near Lyon, two flats. Owner, Chas. P. Ingram; architects, Donovan & Williams; contractor, Donovan & Williams; cost, $3,420; signed, July 9; filed, July 17; limit, October 15; $950 framed; $850 brown coated; $850 completed; $870 35 days.

Geary near Laguna, painting, etc. Owner, I. R. Hall; architect, Geo. E. Voelkel; contractor, F. Klatt; cost, $1,600; signed, July 1; filed, July 18; $200 first coat; $300 varnished; $300 inside done; $200 completed; $600 35 days

Greene between Webster and Fillmore, to build. Owner, Barclay Henley; architect, Samuel Newsom; contractor, R. M. Murray; cost, $7,225; signed, May 29; filed, July 15; $4,083 75 framed; $1,083 75 roofed; $1,083 75 brown coated; $1083 75 outside primed; $1,083 75 completed; $1806 25, 35 days.

Guerrero corner Twenty-fourth, two two-story frames. Owner, Hoffman; builder, Geo. Houson, $6,000.

J. D. Stewart has contracted to improve the residence of Frank Lacoste, on North Third street, for the sum of $3,675. Theodore Lensen is the architect.

Proctor Wells' contract for building the Conservatory of Music, Chapel, Library and Art Gallery, at the University of the Pacific, was filed in the Recorder's office Wednesday. The price is $28,490 and the building is to be completed by December 31, 1889, under a penalty of $5 a day.

A contract between James Farney and Proctor Wells was filed in the Recorder's office Wednesday, wherein the latter agrees to build for the former on the northwest corner of Ninth and San Salvador streets on or before October 1, 1889, a frame dwelling to cost, $2,752.

ALAMEDA.

Chas. Cuneo is having built a five room cottage on Benton street.

Mr. Hamilton will erect a large dwelling on Pacific avenue.

SANTA ROSA.

Col. McDonald is having erected a cottage on Mc Donald avenue.

Simpson & Roberts are erecting a factory building.

UKIAH.

Livernash & Dowling are having erected four brick stores. T. J. Ludwig is doing the work.

CAMP TAYLOR.

Jos. F. Bertrand is building a large hotel near this place. Wm. Schrof of San Francisco is the architect. It is being built by days work under the superintendency of Mr. Anderson and will cost nearly $8,000.

MODESTO.

Contract let to J. P. Allen for the erection of the M. E. Church. Amount $7,000; B. F Price of Philadelphia is the architect.

Carpenters not Wanted.

Since the great Seattle fire, this office has received numerous letters from carpenters inquiring as to the chance for work up north. The following from the "Post Intelligencer" will give ample information.

Carpenter work in Seattle, since the fire, has not been sufficient to supply the demand made by that class of mechanics. Great numbers of them have come here in anticipation of immediately rebuilding another wooden city, and are now disappointed. Work in that line began to cease within one week after the conflagration because the wood structures for tents and tent-roofs were all finished within that time. Just as this work was completed, and before any new and substantial wooden structures had been commenced, steamers came in from San Francisco, laden with hundreds of carpenters. They also flocked hitherward from the east, as far as Maine and Massachusetts, only to discover that work here in their line was at a temporary stand still, lasting for weeks, and which even now is not sufficiently active to give employment to all these throngs that still continue to come. The condition as above stated being apparent, several builders, contractors and carpenters were called upon, for more specific information on the subject. Mr. Henry Jones, contractor, said:

"I never was in a town where more carpenters applied for work within a given time. Since the fire I have had from forty to fifty new applicants each day present themselves for employment. About fifty came up from San Francisco on the last steamer, but others also came from Minneapolis, Chicago and Milwaukee. I have had as many as fifteen apply to me within half an hour."

"It will require from thirty to ninety days for builders to complete plans, get stone basements in and blocks under way so as to require carpenters and several other classes of skilled mechanics. The rush of carpenters is premature. Mechanics should have more sense than to over-run a city on the very heels of a fire."

A. Paulsen, another contractor said:

"About fifty new carpenters every day call on me for work. Some of them appear to be willing to work for any wages; but I have no work for them, and if I had, I want men who stick up for their wages. I think that not more than one half of these floating men are carpenters, although they claim to be such. Besides, it is strange that the city should be so over-run with new carpenters when the proposition is to build the new business portion with brick and iron. More than 1,000 carpenters have come here since the fire."

"It is not carpenters that we require for handling the rough lumber in building new wharves and docks. It is an old saying that a 'hatchet and saw and one day's work on scantling makes some carpenters.'"

Owen Thomas, a builder, being called upon, said: "There are too many in the city who pretend to be carpenters, but not enough mechanics. A man carrying tools, and a carpenter, are often horses of different colors. I suppose this fire will make 5,000 new carpenters. It is said that the building of the Coronado, at San Diego, made more men carpenters than the building of the Palace at San Francisco, which made many thousand. Perhaps the day is past for men to learn their trades as they used to do. Applications made on me last week for carpenter work, would average fifty a day. I hired many during the week and discharged about as many as I hired.

The way I have, from experience, found it to be, carpenters on the Pacific coast have more activity and energy in them than those from the east; but at most we have to hire them as they are and discharge them as we find them to be."

Mr. F. M. Wooderman who is constructing buildings at Gilman's wharf, says he has a daily average of forty carpenters, applying for work.

Mr. George Costen, was then called upon. He said: "The membership of the Seattle Carpenters' Union is steadily increasing, it being numerically stronger than any other labor organization in the city. We are willing and able to supply contractors with good carpenters, according to the nine-hour agreement entered into last spring by and between the union and contractors. Our organization is to assist good carpenters in getting employment and to prevent the incompetent from competing in our work. I think that local contractors should make a distinction in giving work to resident mechanics rather than those who come here among the floating population; and this will be the result if the building inspector requires good workmen, as well as good work in the buildings.

About one third of our capable carpenters are thrown out of work here by reason of the presence of poor ones, that continue to come. Shortly after the fire some unscrupulous contractor, recently from the east, published a notice in the Chicago *Inter-Ocean*, stating that 4,000 carpenters were wanted at Seattle. While they might help a contractor to get work done cheaply, it works an injury to the resident mechanics. Out of the 1,500 carpenters now in this city, not over 35 per cent. are employed. Of these, there are probably 500 who are poor workmen. Wages is $3 60 per day. Notwithstanding the influx, the best policy is to employ good men at nine hours and good wages.

SAN FRANCISCO, CAL.

The * California * Architect * and * Building * News.

VOLUME 10. ENTERED AT POST-OFFICE SAN FRANCISCO, AS SECOND-CLASS MAIL MATTER. ESTABLISHED JANUARY 1879. NUMBER 9.

Official Organ of the San Francisco Chapter, American Institute of Architects.

NOW IN ITS TENTH YEAR.

Established Jan. 1879. *Incorporated Jan.* 1889.

THE

California Architect & Building News

PUBLISHED BY THE

California Architectural Publishing Co.

Office, 408 California St. * * Next to the Bank of California.

PUBLISHED ON THE 15th DAY OF EACH MONTH.

TERMS, PER ANNUM, - - - - $2.00 IN ADVANCE

ADVERTISING RATES FURNISHED ON APPLICATION.

SAN FRANCISCO, SEPTEMBER 15, 1889.

MR. George H. Wolfe, having no further connection with this journal, correspondents will in future please address their communications to the *California Architect and Building News*, 408 California street, San Francisco, Cal.

IN the January number of this journal the announcement was made that a change in ownership had been made and that henceforth it would be managed by a company. This arrangement was satisfactory to some for the following reasons, as stated at the time.

"The publication of a journal devoted to the interests of architects and builders on the Pacific Coast is an important measure and is too self-evident to require the support of argument.

So far, in the history of California, the necessity for such a journal has been met only in the publication of the CALIFORNIA ARCHITECT AND BUILDING NEWS.

That journal, however, has hitherto been an individual enterprise, edited and managed by one still practicing the profession of architect, and therefore has not received that undivided and united support that would flow to a journal entirely free from all personal and professional entanglements."

Since January the journal has been under the management of an individual and has not dropped its personal character as was expected, neither has it assumed the tone which was hoped by many that it would take. It has been more of an advertising sheet than a medium of thought or intelligence.

With this number the architects themselves take control and will strive to make it a worthy organ of a great profession, to which all of the members, whether in this city, in Oregon, or elsewhere on the Pacific Coast, are invited to contribute any item on any subject relating to architecture or building.

Of this number we shall not say more than to ask your indulgence for any imperfections that may appear.

THE regular monthly meeeting of the San Francisco Chapter A. I. A. was held on Friday evening, September 6th In the neighborhood of a dozen members were present. Messrs. Franklin Williams and D. L. Williams of Portland were elected fellow members. The amendment to the by-laws, changing the evening for the regular meeting from the first to the second Friday in the month, was carried. The election of officers was postponed for two weeks, to which time the meeting adjourned in the hopes of having a more numerous attendance.

THE trustees of the Lick fund advertised about two years ago for competitive designs for the statuary provided for in Mr. Lick's bequests, to be erected in this city, to commemorate the early epochs in the history of the State. The proposed monument was to be well worth $100,000, and the premiums offered by the trustees were the execution of the work to the first competitor, $500 to the second, and $300 to the third.

Some twenty-five designs were submitted, but after many months delay the trustees have finally decided that none of the projects were appropriate for the purpose, and have now instituted a second competition, selecting the names of four firms and individuals, who are to submit designs and models of the same, for which the trustees agree to pay each competitor the sum of $750.

We are glad to see that the Lick trustees have learned through the failure of their first competition, that to secure a design on which sufficient time and study have been bestowed to obtain a satisfactory result, it is necessary to assure the designer adequate compensation for that time and study.

It is very evident that a premium not commensurate with the importance of the project will tend to attract designs, whose artistic merit correspond rather to the amount of the premiums offered than to the importance of the proposed work, for no artist or architect of standing is desirous of risking his time, which is money, on such an uncertain proposition as the ordinary competition.

It goes without argument, however, that where designs are called for, and the results do not come up to expectations, it is not right to refuse to pay the proffered prizes to those whose trust in the faith of the management was sufficient to lead them to enter the race.

In this connection we deem it appropriate, and of interest to our readers, to publish the following schedule of terms adopted by the American Institute of Architects nearly twenty years ago, and we desire to urge the justice and equity of the principles involved upon the consideration of public and private societies, and individuals who may in the future invite our brethren to enter into honorable competition.

Schedule of terms regulating open and close competitions for architectural works, adopted by the American Institute of Architects in convention assembled, November 8th and 9th, 1870, and recommended to all architects building committees and proprietors throughout the country.

1. The instructions must not require more drawings or estimates than are necessary in order clearly to explain the design, and should require that all the designs submitted be drawn to a uniform scale, which must be clearly defined, and that all perspectives required to be drawn to the same scale as the geometrical drawings, and on a plane at the corner of the building nearest the point of sight; a deviation from which will cause their rejection.

2. In case the amount to be expended is limited, the instructions must state that an excess of ten per cent on the expense of executing any design, over and above the sum mentioned, will exclude it from competition, the amount of expense to be determined by the professional experts in the jury; and in case the amount to be expended is not fixed, then the competitor may use his own discretion as to the costliness of the design which he makes.

3. A design will be excluded from the competition, if sent in after the stated period, and if it contains deviations from the instructions. If, from any of the above reasons, all submitted designs are rejected, then the jury is bound to publish the reasons which led to its verdict.

4. The period given for preparing the design must be long enough, not only for perfecting it and preparing the necessary drawings, but must make some allowance for the ordinary occupations of competitors. An explicit statement must be given as to the time when the decision on the merits of the designs is to be rendered, and that all designs shall be returned to their authors. An architect's drawings are his own private property, unless paid for, in which case they are for the sole use and benefit of his client; but the actual drawings still belong to the architect who made them.

5. The designs should be submitted to a jury of experts, whose decision is to be final. One half of the jury should be architects, and in the case of an open competition for a public building, it should be selected by the building committee or owner. The jury must be named in the instructions which the committee shall have sanctioned before publication. No person can be competent to serve as juror who submits a design, or is in any way interested in any design submitted, or who has not renounced all intention of participating in the execution of the work.

6. All designs submitted, in open competition for public buildings, should be publicly exhibited two weeks before the decision is made.

7. In the case of open competitions the first premium must not be less than the amount which the architect would have received had there been no competition, and at least an e ual amount should be divided among the other competitors, according to the merits of the designs submitted.

8. It is recommended that, in close competitions, wherein the number of competitors is limited, a sum equal to the full value of one design be divided equally among the authors of all except the premiated design, which shall be compensated for as provided in the last preceding rule.

9. The instructions must state that in case the building is erected after any of the designs submitted in competition, it must be given in charge of the author of the first premiated design, who is to be employed at the usual compensation; and if any other designs, or parts of designs, are used, it can be done only with the consent of their authors: and they must be compensated for the full value of the designs or parts of designs used, irrespective of the premiums that may have been awarded.

10. The premiums must be awarded, under all circumstances, for the designs which may have been admitted in competition.

11. It is recommended that, in the schemes of competition, it shall be provided that the names of the competitors shall not be known to the jury.

Academy of Sciences.

The engraving of the new building for the California Academy of Sciences which appears in this issue of the Architect was to have been printed with the August number, but by the carelessness of a work-man the cut was destroyed, and the view which is now inserted has been made the second time. This view represents the front of the new California Academy of Sciences Building now in course of construction on Market street, between Fourth and Fifth. It has been prepared with great care from drawings made by Messrs. Percy and Hamilton, constructing architects.

The structure to which this front belongs, will be one of the finest and most substantial in the city. It nearly covers the whole of a trapezoid, the two parallel sides of which measure respectively 275 and 195 feet; the side at right angles which fronts on Market street, being 80 feet. It will cost over $300,000 and it will be built of the best stone, brick, iron and other materials to be found in the market.

The building is divided into two different structures; one facing on Market street, covering an area of about 80x86 feet, being a commercial block; the other is devoted to the rooms of the Academy. The former is seven stories high, the Academy six. Between the two structures there is a court 80x27 feet.

The California Academy of Sciences was organized on April 4, 1853. None of the charter members are now alive. It had a very precarious existence for a great many years; and had not the late philanthropist James Lick so munificently endowed it, first with the lot on Market street, valued at over $300,000 and afterwards with one half of the residue of his valuable estate, which will nearly reach half a million dollars, it is doubtful if the Academy of Sciences could have for many years moved from the dilapidated building where it is now located, where a gradual deterioration is going on in everything combined in a building so thoroughly saturated with water as that building is, where dampness constantly sweats from its walls, where moisture constantly burdens the atmosphere and where moss and mould and mildew lurk in every crack and cranny of the building attacking and damaging every perishable thing therein contained. The occupation of the building by those whose business constantly calls them there is only rendered tolerable by constant fires in the stove all the year around.

Fortunately due to the generosity of Mr. Lick and the energy of the present Board of Trustees, in the course of the next year the quarters of the Academy will be in one of the best buildings erected for that purpose in America.

The former Board of Trustees were averse to incurring a large debt in order to improve the valuable lot owned by the Academy on Market street, but the present Board thinks it is poor policy to allow the collections to go to ruin for lack of proper rooms and deprive the members of the Academy of suitable lecture rooms, library, museum and other departments of such an institution; besides losing the handsome revenue derived from the rental of the commercial block so advantageously situated as the one owned by the society.

At the begining of last year the President of the Board of Trustees and the prudential committee reported to the Academy the intention of the Board of Trustees to improve as soon as possible the property on Market street. The Council of the Academy and the Academy in one of its meetings passed resolutions indorsing the resolution of the Board of Trustees. Satisfactory arrangements having been made by which the Lick State Trustees would advance to the Academy of Sciences all the necessary funds to erect the contemplated building, steps were taken at once to carry out the project.

In May of last year a circular was sent to many architects inviting them to present plans for an Academy of Sciences building to conform with certain specified requirements. The firms of J. M. Curtis, W. F. Smith, Percy & Hamilton, Salfield & Kohlberg and J. J. & T. D. Newsom responded to the invitation and offered plans which were opened on June 18, 1888.

It was found that all the plans, though meritorious and conscientiously executed did not answer the requirements of the Academy and it was resolved by the Board of Trustees to accept them all but adopt none.

The order in which the plans were accepted was: First, those of J. M. Curtis; second, W. F. Smith's; third, Percy & Hamilton's; fourth, Salfield & Kohlberg's; and fifth, J. J. & J. D. Newsom's.

A committee composed of Messrs. Davis and Molera of the Board of Trustees and Dr. Harkness, president of the Academy was appointed to take from the plans submitted those features best adopted to the needs of the Academy and supplement them with those they themselves might suggest. Also to recommend who among the competing architects should be appointed supervising architect.

After many consultations the Committee prepared the general plans. Mr. Davis made the plans for the Commercial building, Dr. Harkness the distribution of rooms for the Academy, and Mr. Molera the fronts of the building and the general plans. These plans were agreed to and submitted by all the members of the Committee. They differed, however, in the appointment of the supervising architect. Mr. Davis recommending Mr. Curtis while Messrs. Harkness and Molera recommended the firm of Percy and Hamilton.

The Board of Trustees adopted the recommendation of the majority and Messrs. Percy & Hamilton were appointed the architects "to prepare the necessary drawings and specifications to erect the Academy's building and take the general plans prepared by the committee on plans, composed by Messrs. Molera Davis and Harkness as the basis of their operations."

The general plans have been changed in many particulars, specially the front of the building The late Mr. Lick in his deed of the Market street property and subsequently on the deed of trust, expressed his desire that the Academy's building should be of a classical design. In deference to that wish and according to their own ideas the committee designed the front of the Academy with classical elements. The architects have changed it for a front on the so-called Romanesque style, the reasons for the changes are that it is difficult to design buildings of more than two or three stories high with classical lines. For an Academy of Sciences, it would have been better to adopt a classical front than one in a style the best recommendation of which being its novelty. That buildings with classical orders and several stories high can be built with handsome fronts is numerously exemplified both in Europe and in this country, and conspicuously so in the recently completed Drexel building in New York ten stories high, which is one of the grandest and and handsomest buildings in America. However, the Academy of Sciences front is a fine one and in combination with the splendid materials used in its construction, will do credit both to the Association and the architects.

E. N. SHAW, in an article published in the *Architect* (a London periodical) says the contents of a building have undoubtedly much to do with its safety or danger, but in estimating the whole risk, the materials of which the building is constructed must never be put out of consideration. Every building cannot be erected with brick column and groined arches, but there is a vast range between these and the miserable cast iron pots too commonly to be seen, many of which have been put in without having been tested for strength even at the ordinary temperature of the atmosphere, much less at that of a fire. The following illustration may be given of a fact well-known to all firemen of experience, but seldom proved by demonstration for those not specially interested.

A fire occurred in a warehouse of enormous proportions and raged with great fury for five hours, at the end of which time it was extinguished, and a very large proportion of the building and its contents saved. The warehouse was constructed of brick walls; it had wooden floors supported on wooden beams, which in their turn were carried on wooden story posts about 12 inches thick, and, although serious damage was done, not one portion of the heavy wood-work was destroyed. After the fire, the proprietors allowed the chief of the fire brigade to remove one of the story posts, with a section of the beams and other parts surrounding it above and below.

This post had been subjected to the full action of the fire during the whole of its duration, as already mentioned, or, making full allowance for everything, including the delay of the fire attacking the particular spot on which it stood, and the time at which the cooling process commenced, certainly not less than four and a half hours. As large quantities of water had been used, and it was probable that every thing had been saturated, the wood was carefully dried before a strong fire until not a trace of moisture remained in it. It was then set on end in an open yard, exactly as it had stood in the warehouse, with the pedestal underneath, the cap above, and the beam across the cap, more than a ton of shavings, light wood and heavy wood were placed around it, and after the whole heap was saturated with petroleum, a light was applied to it, and after this, large quantities of petroleum and turpentine were pumped on it. At the end of two and a half hours the post, beam and other parts were withdrawn from the fire, and within a few minutes from the time they were withdrawn they ceased to burn. A few feet were then sawn off horizontally, at that part which had suffered most from the flames, and afterward the same piece was split longitudinally with steel wedges, in order to examine its condition.

The post was of pitch pine, about the most inflammable wood known, and yet after exposure for seven hours to fire, the fury of which could not be exceeded except in blast furnaces, it contained within a quantity of perfectly uninjured and apparently fresh wood, probably capable of supporting the whole weight the original post was designed to carry. Immediately after the saw cut, and again after the cleating with steel wedges, the centre was carefully examined, and found to be just perceptibly warm to the touch, but nothing more, thus proving that the fibre, in which the strength lay, was quite uninjured.

A new work has been laid on our table entitled: A Manual of Machine Construction for Engineers, Draughtsmen and Mechanics, by John Richards, Esq. The summary of contents are: Machine Design, The Transmission of Power, Steam Machinery, Hydraulics, Process and Properties, Tables and Memoranda. It is well illustrated with clean cut drawings of machinery on a large scale, and contains tables and formulæ seldom found in technical works, the use of which will greatly lighten the office labor of the engineer. It is bound in strong, flexible covers and so arranged that it can be used with one hand while working with the other. Publisher's price, $5.00.

AT the recent meeting of the National Electric Light Association at Niagara Falls, considerable time was taken up by the reading of papers and the discussions of the requirements for buildings intended for this purpose. Mr. M. D. Law read a paper, giving his view of certain necessary details for a model building, which should be of brick or stone, substantial, and not more than two stories in height, and as near fire-proof as possible. The boiler room should be located on the ground floor with plenty of ventilation, and the fire room cool and comfortable. It being necessary to keep engines, shafting and dynamos as cool as possible good ventilation should be provided therefore. The dynamo room should be directly over the shafting lines, well lighted and the ventilation perfect. The roof should be constructed without intermediate posts or supports, and of sufficient height and strength to support an overhead track, so that dynamos or armatures can be hoisted and carried over the ones that may be running. A cupola should be provided with window ventilators extending the full length of the two sides, and so arranged as to be under the control of the machine man; the line wires being run from this cupola as required. A store room of good size should be provided and fitted up with closets, drawers and shelves. The workshop should be suitable for lathe and benches.

Mr. G. T. Henthorn gave a detailed description of a new station building at Providence, R. I.

Those wishing to continue the subject will find a full description in the issue of August 17th of the *Western Electrician* of Chicago.

The Kearny street property owners and business men have petitioned the Board of Supervisors to have that street paved with bituminous rock. The Street Committee of the Board has approved the petition and ordered specifications for the work to be prepared. The laying of this pavement on one of our principal streets will be a long step in the right direction, for besides the advantage of noiselessness this pavement requires but a fraction of the traction power necessary on the uneven cobbles and basalt blocks with which our main business streets are now disfigured.

In new apartments. The Technical Society and the Astronomical Society of the Pacific Coast have rented the large rooms adjoining the offices of this Journal. These spacious rooms are light, airy and convenient, and will be open at all times of the day to the membership of these societies. We congratulate them on their new departure and welcome them to all the benefits.

Magnitude in Architecture.

MAGNITUDE is the great object and result of design, and this quality is only to be attained by the fine adjustment of relative proportions in magnitude and order. Architecture (says Aristotle) consists in magnitude and order. The works of man, compared with those of Nature, display our insignificance. The Pyramids, seen in the clear sky of Egypt, or St. Peter's at Rome, are proverbially disappointing to the first gaze of the beholder; it is only after he has instituted comparisons and measurements that he becomes sensible of the greatness of these human efforts—and his memory will supply him with many instances in which objects of inferior dimensions have surpassed them in impression of magnitude upon his mind. It is plain, therefore, that art alone can produce the full effect of magnitude, and to this the architect should direct all his skill; the ancients will be found consummate masters in this as well as in every other department of our art. It is, indeed, a fine art which enables the accomplished artist to raise ideas of magnitude and grandeur of composition on a piece of paper no bigger than your hand; while a less able one will cover a vast canvas without executing any comparable notions. Worthy of all inquiry and solicitude is such an art, for is the whole art of design and proportion. Pliny cities a statue of Hercules, so small that it might be lifted by the hand, which, however, conveyed more grandeur, magnitude and strength to the mind of the observer than a Colossus would have done. How great must have been the science of the master! And if, with such small means, he could effect the mind with these impressions, how great the economy of cost and material to the employer!—C. R. Cockerel, in *The Architect*.

P. F. Nelson is putting up a five room and basement cottage on the east side of Myrtle near Twenty sixth, for A. Rankin to cost about $1,500.

F. K. Shattuck has decided to tear down his old brick building on the south-west corner of Eighth street and Broadway early next spring, and he will erect a handsome modern building, at least three stories high, that will throw the Delger building in the shade. Mr. Shattuck is improving all his property, and is making many improvements in Oakland.

Buck & Judkins have contracted with Nettie Fife to erect a building on the corner of Eleventh avenue and East Sixteenth street, to cost $2,350.

Dr. W. C. Harrington has begun the erection of a handsome modern two-story residence on the northeast corner of Twenty-first street and Tenth Avenue. Robert Smilie is the contractor and the cost will be about $5,000.

It is reported that the Judson Iron Works will be extended. A twenty-four inch bar mill will be erected. This establishment will have the largest capacity of any on the coast.

It is stated on good authority that M. B. Curtis is soon to build a large business block on the corner of San Pablo and University avenues.

E. L. Clifton, who purchased two of the Wood's lots from Scotchler & Gottshall, is erecting thereon a $2,500 cottage.

F. C. Brougher has contracted to erect a building on the southeast side of Fifteenth street, between Seventh and Eighth avenues, for Mrs. Mary B. Watson, the price named being $1,550.

The contract for the erection of the new school building has been awarded to Thomas Downing of Mission San Jose, who has just completed the Warm Springs building. Contract price, $4,300 for main building; out-buildings, $95. Work will be commenced at once, and the contract calls for the completion of the house by October 10.

SAN JOSE.

J. D. Stewart has contracted to improve the residence of Frank Lacoste, on North Third street, for the sum of $3,675. Theodore Lensen is the architect.

Proctor Wells' contract for building the Conservatory of Music, Chapel, Library and Art Gallery, at the University of the Pacific, was filed in the Recorder's office Wednesday. The price is $28,499 and the building is to be completed by December 31, 1889, under a penalty of $5 a day.

A contract between James Farney and Proctor Wells was filed in the Recorder's office Wednesday, wherein the latter agrees to build for the former on the northwest corner of Ninth and San Salvador streets on or before October 1, 1889, a frame dwelling to cost, $2,752.

ALAMEDA.

Chas. Cuneo is having built a five room cottage on Benton street.

Mr. Hamilton will erect a large dwelling on Pacific avenue.

SANTA ROSA.

Col. McDonald is having erected a cottage on Mc Donald avenue.

Simpson & Roberts are erecting a factory building.

UKIAH.

Livernash & Dowling are having erected four brick stores. T. J. Ludwig is doing the work.

CAMP TAYLOR.

Jos. F. Bertrand is building a large hotel near this place. Wm. Schrof of San Francisco is the architect. It is being built by days work under the superintendency of Mr. Anderson and will cost nearly $8,000.

MODESTO.

Contract let to J. P. Allen for the erection of the M. E. Church. Amount $7,000; B. F Price of Philadelphia is the architect.

Carpenters not Wani

Since the great Seattle fire, this off ceived numerous letters from carpente as to the chance for work up north. ing from the "Post Intelligencer" will information.

Carpenter work in Seattle, since t not been sufficient to supply the dema that class of mechanics. Great numb have come here in anticipation of i rebuilding another wooden city, and a appointed. Work in that line bega within one week after the conflagrat the wood structures for tents and ten all finished within that time. Just a was completed, and before any new a tial wooden structures had been steamers came in from San Franc with hundreds of carpenters. They hitherward from the east, as far as Massachusetts, only to discover that in their line was at a temporary stan ing for weeks, and which even now ciently active to give employment throngs that still continue to come. dition as above stated being appar builders, contractors and carpenters upon, for more specific information on Mr. Henry Jones, contractor, said:

"I never was in a town where more applied for work within a given time. fire I have had from forty to fifty new each day present themselves for e About fifty came up from San Francisco steamer, but others also came from Chicago and Milwaukee. I have had fifteen apply to me within half an hou

"It will require from thirty to nin builders to complete plans, get stone b and blocks under way so as to require and several other classes of skilled mech rush of carpenters is premature. Mech have more sense than to over-run a very heels of a fire."

A. Paulsen, another contractor said:

"About fifty new carpenters every day call on me for work. Some of them appear to be willing to work for any wages; but I have no work for them, and if I had, I want men who stick up for their wages. I think that not more than one half of these floating men are carpenters, although they claim to be such. Besides, it is strange that the city should be so over-run with new carpenters when the proposition is to build the new business portion with brick and iron. More than 1,000 carpenters have come here since the fire."

"It is not carpenters that we require for handling the rough lumber in building new wharves and docks. It is an old saying that a 'hatchet and saw and one day's work on scantling makes some carpenters.'"

Owen Thomas, a builder, being called upon, said: "There are too many in the city who pretend to be carpenters, but not enough mechanics. A man carrying tools, and a carpenter, are often horses of different colors. I suppose this fire will make 5,000 new carpenters. It is said that the building of the Coronado at San Diego made more men

SAN FRANCISCO, CAL.

The * California * Architect * and * Building * News.

VOLUME 10. ENTERED AT POST-OFFICE SAN FRANCISCO, AS SECOND-CLASS MAIL MATTER. ESTABLISHED JANUARY 1879. NUMBER 9.

Official Organ of the San Francisco Chapter, American Institute of Architects.

NOW IN ITS TENTH YEAR.

and is too self-evident to require the support of argument.

So far, in the history of California, the necessity for such a journal has been met only in the publication of the CALIFORNIA ARCHITECT AND BUILDING NEWS.

That journal, however, has hitherto been an individual enterprise, edited and managed by one still practicing the profession of architect, and therefore has not received that undivided and united support that would flow to a journal entirely free from all personal and professional entanglements."

Since January the journal has been under the management of an individual and has not dropped its personal character as was expected, neither has it assumed the tone which was hoped by many that it would take. It has been more of an advertising sheet than a medium of thought or intelligence.

With this number the architects themselves take control and will strive to make it a worthy organ of a great profession, to which all of the members, whether in this city, in Oregon, or elsewhere on the Pacific Coast, are invited to contribute any item on any subject relating to architecture or building.

Of this number we shall not say more than to ask your indulgence for any imperfections that may appear.

THE regular monthly meeeting of the San Francisco Chapter A. I. A. was held on Friday evening, September 6th In the neighborhood of a dozen members were present. Messrs. Franklin Williams and D. L. Williams of Portland were elected fellow members. The amendment to the by-laws, changing the evening for the regular meeting from the first to the second Friday in the month, was carried. The election of officers was ed for two weeks, to which time the meeting adjourned opes of having a more numerous attendance.

E trustees of the Lick fund advertised about two years ago for competitive designs for the statuary provided for in Mr. Lick's bequests, to be erected in this city, to com emorate the early epochs in the history of the State. The l monument was to be well worth $100,000, and the premi red by the trustees were the execution of the work to competitor, $500 to the second, and $300 to the third. twenty-five designs were submitted, but after many delay the trustees have finally decided that none of the were appropriate for the purpose, and have now insti econd competition, selecting the names of four firms and als, who are to submit designs and models of the same, h the trustees agree to pay each competitor the sum of

e glad to see that the Lick trustees have learned through re of their first competition, that to secure a design on fficient time and study have been bestowed to obtain a ory result, it is necessary to assure the designer adequate ation for that time and study.

ery evident that a premium not commensurate with the ce of the project will tend to attract designs, whose ar- rit correspond rather to the amount of the premiums an to the importance of the proposed work, for no ar- chitect of standing is desirous of risking his time, which , on such an uncertain proposition as the ordinary com-

without argument, however, that where designs are , and the results do not come up to expectations, it is t to refuse to pay the proffered prizes to those whose he faith of the management was sufficient to lead them he race.

connection we deem it appropriate, and of interest to rs, to publish the following schedule of terms adopted merican Institute of Architects nearly twenty years ago, esire to urge the justice and equity of the principles in- on the consideration of public and private societies, iduals who may in the future invite our brethren to enter into honorable competition.

Schedule of terms regulating open and close competitions for architectural works, adopted by the American Institute of Architects in convention assembled, November 8th and 9th, 1870, and recommended to all architects building committees and proprietors throughout the country.

1. The instructions must not require more drawings or estimates than are necessary in order clearly to explain the design, and should require that all the designs submitted be drawn to a uniform scale, which must be clearly defined, and that all perspectives required to be drawn to the same scale as the geometrical drawings, and on a plane at the corner of the building nearest the point of sight; a deviation from which will cause their rejection.

2. In case the amount to be expended is limited, the instructions must state that an excess of ten per cent on the expense of executing any design, over and above the sum mentioned, will exclude it from competition, the amount of expense to be determined by the professional experts in the jury; and in case the amount to be expended is not fixed, then the competitor may use his own discretion as to the costliness of the design which he makes.

P. F. Nelson is putting up a five room and basement cottage on the east side of Myrtle near Twenty sixth, for A. Rankin to cost about $1,500.

F. K. Shattuck has decided to tear down his old brick building on the south-west corner of Eighth street and Broadway early next spring, and he will erect a handsome modern building, at least three stories high, that will throw the Delger building in the shade. Mr. Shattuck is improving all his property, and is making many improvements in Oakland.

Buck & Judkins have contracted with Nettie Fife to erect a building on the corner of Eleventh avenue and East Sixteenth street, to cost $2,350.

Dr. W. C. Harrington has begun the erection of a handsome modern two-story residence on the northeast corner of Twenty-first street and Tenth Avenue. Robert Smilie is the contractor and the cost will be about $5,000.

It is reported that the Judson Iron Works will be extended. A twenty-four inch bar mill will be erected. This establishment will have the largest capacity of any on the coast.

It is stated on good authority that M. B. Curtis is soon to build a large business block on the corner of San Pablo and University avenues.

E. L. Clifton, who purchased two of the Wood's lots from Scotchler & Gottshall, is erecting thereon a $2,500 cottage.

F. C. Brougher has contracted to erect a building on the southeast side of Fifteenth street, between Seventh and Eighth avenues, for Mrs. Mary B. Watson, the price named being $1,550.

The contract for the erection of the new school building has been awarded to Thomas Downing of Mission San Jose, who has just completed the Warm Springs building. Contract price, $4,300 for main building; out-buildings, $95. Work will be commenced at once, and the contract calls for the completion of the house by October 10.

SAN JOSE.

J. D. Stewart has contracted to improve the residence of Frank Lacoste, on North Third street, for the sum of $3,675. Theodore Lensen is the architect.

Proctor Wells' contract for building the Conservatory of Music, Chapel, Library and Art Gallery, at the University of the Pacific, was filed in the Recorder's office Wednesday. The price is $28,499 and the building is to be completed by December 31, 1889, under a penalty of $5 a day.

A contract between James Farney and Proctor Wells was filed in the Recorder's office Wednesday, wherein the latter agrees to build for the former on the northwest corner of Ninth and San Salvador streets on or before October 1, 1889, a frame dwelling to cost, $2,752.

ALAMEDA.

Chas. Cuneo is having built a five room cottage on Benton street.

Mr. Hamilton will erect a large dwelling on Pacific avenue.

SANTA ROSA.

Col. McDonald is having erected a cottage on Mc Donald avenue.

Simpson & Roberts are erecting a factory building.

UKIAH.

Livernash & Dowling are having erected four brick stores. T. J. Ludwig is doing the work.

CAMP TAYLOR.

Jos. F. Bertrand is building a large hotel near this place. Wm. Schrof of San Francisco is the architect. It is being built by days work under the superintendency of Mr. Anderson and will cost nearly $8,000.

MODESTO.

Contract let to J. P. Allen for the erection of the M. E. Church. Amount $7,000; B. F Price of Philadelphia is the architect.

Carpenters not Wanted.

Since the great Seattle fire, this office has received numerous letters from carpenters inquiring as to the chance for work up north. The following from the "Post Intelligencer" will give ample information.

Carpenter work in Seattle, since the fire, has not been sufficient to supply the demand made by that class of mechanics. Great numbers of them have come here in anticipation of immediately rebuilding another wooden city, and are now disappointed. Work in that line began to cease within one week after the conflagration because the wood structures for tents and tent-roofs were all finished within that time. Just as this work was completed, and before any new and substantial wooden structures had been commenced, steamers came in from San Francisco, laden with hundreds of carpenters. They also flocked hitherward from the east, as far as Maine and Massachusetts, only to discover that work here in their line was at a temporary stand-still, lasting for weeks, and which even now is not sufficiently active to give employment to all these throngs that still continue to come. The condition as above stated being apparent, several builders, contractors and carpenters were called upon, for more specific information on the subject. Mr. Henry Jones, contractor, said:

"I never was in a town where more carpenters applied for work within a given time. Since the fire I have had from forty to fifty new applicants each day present themselves for employment. About fifty came up from San Francisco on the last steamer, but others also came from Minneapolis, Chicago and Milwaukee. I have had as many as fifteen apply to me within half an hour."

"It will require from thirty to ninety days for builders to complete plans, get stone basements in and blocks under way so as to require carpenters and several other classes of skilled mechanics. The rush of carpenters is premature. Mechanics should have more sense than to over-run a city on the very heels of a fire."

A. Paulsen, another contractor said:

"About fifty new carpenters every day call on me for work. Some of them appear to be willing to work for any wages; but I have no work for them, and if I had, I want men who stick up for their wages. I think that not more than one half of these floating men are carpenters, although they claim to be such. Besides, it is strange that the city should be so over-run with new carpenters when the proposition is to build the new business portion with brick and iron. More than 1,000 carpenters have come here since the fire."

"It is not carpenters that we require for handling the rough lumber in building new wharves and docks. It is an old saying that a 'hatchet and saw and one day's work on scantling makes some carpenters.'"

Owen Thomas, a builder, being called upon, said: "There are too many in the city who pretend to be carpenters, but not enough mechanics. A man carrying tools, and a carpenter, are often horses of different colors. I suppose this fire will make 5,000 new carpenters. It is said that the building of the Coronado, at San Diego, made more men carpenters than the building of the Palace at San Francisco, which made many thousand. Perhaps the day is past for men to learn their trades as they used to do. Applications made on me last week for carpenter work, would average fifty a day. I hired many during the week and discharged about as many as I hired.

The way I have, from experience, found it to be, carpenters on the Pacific coast have more activity and energy in them than those from the east; but at most we have to hire them as they are and discharge them as we find them to be."

Mr. F. M. Wooderman who is constructing buildings at Gilman's wharf, says he has a daily average of forty carpenters, applying for work.

Mr. George Costen, was then called upon. He said: "The membership of the Seattle Carpenters' Union is steadily increasing, it being numerically stronger than any other labor organization in the city. We are willing and able to supply contractors with good carpenters, according to the nine-hour agreement entered into last spring by and between the union and contractors. Our organization is to assist good carpenters in getting employment and to prevent the incompetent from competing in our work. I think that local contractors should make a distinction in giving work to resident mechanics rather than those who come here among the floating population; and this will be the result if the building inspector requires good workmen, as well as good work in the buildings.

About one-third of our capable carpenters are thrown out of work here by reason of the presence of poor ones, that continue to come. Shortly after the fire some unscrupulous contractor, recently from the east, published a notice in the Chicago *Inter-Ocean*, stating that 4,000 carpenters were wanted at Seattle. While they might help a contractor to get work done cheaply, it works an injury to the resident mechanics. Out of the 1,500 carpenters now in this city, not over 35 per cent. are employed. Of these, there are probably 500 who are poor workmen. Wages is $3 60 per day. Notwithstanding the influx, the best policy is to employ good men at nine hours and good wages.

SAN FRANCISCO, SEPTEMBER 15, 1889.

MR. George H. Wolfe, having no further connection with this journal, correspondents will in future please address their communications to the *California Architect and Building News*, 408 California street, San Francisco, Cal.

IN the January number of this journal the announcement was made that a change in ownership had been made and that henceforth it would be managed by a company. This arrangement was satisfactory to some for the following reasons, as stated at the time.

"The publication of a journal devoted to the interests of architects and builders on the Pacific Coast is an important measure and is too self-evident to require the support of argument.

So far, in the history of California, the necessity for such a journal has been met only in the publication of the CALIFORNIA ARCHITECT AND BUILDING NEWS.

That journal, however, has hitherto been an individual enterprise, edited and managed by one still practicing the profession of architect, and therefore has not received that undivided and united support that would flow to a journal entirely free from all personal and professional entanglements."

Since January the journal has been under the management of an individual and has not dropped its personal character as was expected, neither has it assumed the tone which was hoped by many that it would take. It has been more of an advertising sheet than a medium of thought or intelligence.

With this number the architects themselves take control and will strive to make it a worthy organ of a great profession, to which all of the members, whether in this city, in Oregon, or elsewhere on the Pacific Coast, are invited to contribute any item on any subject relating to architecture or building.

Of this number we shall not say more than to ask your indulgence for any imperfections that may appear.

THE regular monthly meeeting of the San Francisco Chapter A. I. A. was held on Friday evening, September 6th In the neighborhood of a dozen members were present. Messrs. Franklin Williams and D. L. Williams of Portland were elected fellow members. The amendment to the by-laws, changing the evening for the regular meeting from the first to the second Friday in the month, was carried. The election of officers was postponed for two weeks, to which time the meeting adjourned in the hopes of having a more numerous attendance.

THE trustees of the Lick fund advertised about two years ago for competitive designs for the statuary provided for in Mr. Lick's bequests, to be erected in this city, to commemorate the early epochs in the history of the State. The proposed monument was to be well worth $100,000, and the premiums offered by the trustees were the execution of the work to the first competitor, $500 to the second, and $300 to the third.

Some twenty-five designs were submitted, but after many months delay the trustees have finally decided that none of the projects were appropriate for the purpose, and have now instituted a second competition, selecting the names of four firms and individuals, who are to submit designs and models of the same, for which the trustees agree to pay each competitor the sum of $750.

We are glad to see that the Lick trustees have learned through the failure of their first competition, that to secure a design on which sufficient time and study have been bestowed to obtain a satisfactory result, it is necessary to assure the designer adequate compensation for that time and study.

It is very evident that a premium not commensurate with the importance of the project will tend to attract designs, whose artistic merit correspond rather to the amount of the premiums offered than to the importance of the proposed work, for no artist or architect of standing is desirous of risking his time, which is money, on such an uncertain proposition as the ordinary competition.

It goes without argument, however, that where designs are called for, and the results do not come up to expectations, it is not right to refuse to pay the proffered prizes to those whose trust in the faith of the management was sufficient to lead them to enter the race.

In this connection we deem it appropriate, and of interest to our readers, to publish the following schedule of terms adopted by the American Institute of Architects nearly twenty years ago, and we desire to urge the justice and equity of the principles involved upon the consideration of public and private societies, and individuals who may in the future invite our brethren to enter into honorable competition.

Schedule of terms regulating open and close competitions for architectural works, adopted by the American Institute of Architects in convention assembled, November 8th and 9th, 1870, and recommended to all architects building committees and proprietors throughout the country.

1. The instructions must not require more drawings or estimates than are necessary in order clearly to explain the design, and should require that all the designs submitted be drawn to a uniform scale, which must be clearly defined, and that all perspectives required to be drawn to the same scale as the geometrical drawings, and on a plane at the corner of the building nearest the point of sight; a deviation from which will cause their rejection.

2. In case the amount to be expended is limited, the instructions must state that an excess of ten per cent on the expense of executing any design, over and above the sum mentioned, will exclude it from competition, the amount of expense to be determined by the professional experts in the jury; and in case the amount to be expended is not fixed, then the competitor may use his own discretion as to the costliness of the design which he makes.

3. A design will be excluded from the competition, if sent in after the stated period, and if it contains deviations from the instructions. If, from any of the above reasons, all submitted designs are rejected, then the jury is bound to publish the reasons which led to its verdict.

4. The period given for preparing the design must be long enough, not only for perfecting it and preparing the necessary drawings, but must make some allowance for the ordinary occupations of competitors. An explicit statement must be given as to the time when the decision on the merits of the designs is to be rendered, and that all designs shall be returned to their authors. An architect's drawings are his own private property, unless paid for, in which case they are for the sole use and benefit of his client; but the actual drawings still belong to the architect who made them.

5. The designs should be submitted to a jury of experts, whose decision is to be final. One half of the jury should be architects, and in the case of an open competition for a public building, it should be selected by the building committee or owner. The jury must be named in the instructions which the committee shall have sanctioned before publication. No person can be competent to serve as juror who submits a design, or is in any way interested in any design submitted, or who has not renounced all intention of participating in the execution of the work.

6. All designs submitted, in open competition for public buildings, should be publicly exhibited two weeks before the decision is made.

7. In the case of open competitions the first premium must not be less than the amount which the architect would have received had there been no competition, and at least an equal amount should be divided among the other competitors, according to the merits of the designs submitted.

8. It is recommended that, in close competitions, wherein the number of competitors is limited, a sum equal to the full value of one design be divided equally among the authors of all except the premiated design, which shall be compensated for as provided in the last preceding rule.

9. The instructions must state that in case the building is erected after any of the designs submitted in competition, it must be given in charge of the author of the first premiated design, who is to be employed at the usual compensation; and if any other designs, or parts of designs, are used, it can be done only with the consent of their authors; and they must be compensated for the full value of the designs or parts of designs used, irrespective of the premiums that may have been awarded.

10. The premiums must be awarded, under all circumstances, for the designs which may have been admitted in competition.

11. It is recommended that, in the schemes of competition, it shall be provided that the names of the competitors shall not be known to the jury.

Academy of Sciences.

The engraving of the new building for the California Academy of Sciences which appears in this issue of the Architect was to have been printed with the August number, but by the carelessness of a work-man the cut was destroyed, and the view which is now inserted has been made the second time. This view represents the front of the new California Academy of Sciences Building now in course of construction on Market street, between Fourth and Fifth. It has been prepared with great care from drawings made by Messrs. Percy and Hamilton, constructing architects.

The structure to which this front belongs, will be one of the finest and most substantial in the city. It nearly covers the whole of a trapezoid, the two parallel sides of which measure respectively 275 and 195 feet; the side at right angles which fronts on Market street, being 80 feet. It will cost over $300,000 and it will be built of the best stone, brick, iron and other materials to be found in the market.

The building is divided into two different structures; one facing on Market street, covering an area of about 80x86 feet, being a commercial block; the other is devoted to the rooms of the Academy. The former is seven stories high, the Academy six. Between the two structures there is a court 80x27 feet.

The California Academy of Sciences was organized on April 4, 1853. None of the charter members are now alive. It had a very precarious existence for a great many years; and had not the late philanthropist James Lick so munificently endowed it, first with the lot on Market street, valued at over $300,000 and afterwards with one half of the residue of his valuable estate, which will nearly reach half a million dollars, it is doubtful if the Academy of Sciences could have for many years moved from the dilapidated building where it is now located, where a gradual deterioration is going on in everything combined in a building so thoroughly saturated with water as that building is, where dampness constantly sweats from its walls, where moisture constantly burdens the atmosphere and where moss and mould and mildew lurk in every crack and cranny of the building attacking and damaging every perishable thing therein contained. The occupation of the building by those whose business constantly calls them there is only rendered tolerable by constant fires in the stove all the year around.

Fortunately due to the generosity of Mr. Lick and the energy of the present Board of Trustees, in the course of the next year the quarters of the Academy will be in one of the best buildings erected for that purpose in America.

The former Board of Trustees were averse to incurring a large debt in order to improve the valuable lot owned by the Academy on Market street, but the present Board thinks it is poor policy to allow the collections to go to ruin for lack of proper rooms and deprive the members of the Academy of suitable lecture rooms, library, museum and other departments of such an institution; besides losing the handsome revenue derived from the rental of the commercial block so advantageously situated as the one owned by the society.

At the begining of last year the President of the Board of Trustees and the prudential committee reported to the Academy the intention of the Board of Trustees to improve as soon as possible the property on Market street. The Council of the Academy and the Academy in one of its meetings passed resolutions indorsing the resolution of the Board of Trustees. Satisfactory arrangements having been made by which the Lick State Trustees would advance to the Academy of Sciences all the necessary funds to erect the contemplated building, steps were taken at once to carry out the project.

In May of last year a circular was sent to many architects inviting them to present plans for an Academy of Sciences building to conform with certain specified requirements. The firms of J. M. Curtis, W. F. Smith, Percy & Hamilton, Salfield & Kohlberg and J. J. & T. D. Newsom responded to the invitation and offered plans which were opened on June 18, 1888.

It was found that all the plans, though meritorious and conscientiously executed did not answer the requirements of the Academy and it was resolved by the Board of Trustees to accept them all but adopt none.

The order in which the plans were accepted was: First, those of J. M. Curtis; second, W. F. Smith's; third, Percy & Hamilton's; fourth, Salfield & Kohlberg's; and fifth, J. J. & J. D. Newsom's.

A committee composed of Messrs. Davis and Molera of the Board of Trustees and Dr. Harkness, president of the Academy was appointed to take from the plans submitted those features best adopted to the needs of the Academy and supplement them with those they themselves might suggest. Also to recommend who among the competing architects should be appointed supervising architect.

After many consultations the Committee prepared the general plans. Mr. Davis made the plans for the Commercial building, Dr. Harkness the distribution of rooms for the Academy, and Mr. Molera the fronts of the building and the general plans. These plans were agreed to and submitted by all the members of the Committee. They differed, however, in the appointment of the supervising architect. Mr. Davis recommending Mr. Curtis while Messrs. Harkness and Molera recommended the firm of Percy and Hamilton.

The Board of Trustees adopted the recommendation of the majority and Messrs. Percy & Hamilton were appointed the architects "to prepare the necessary drawings and specifications to erect the Academy's building and take the general plans prepared by the committee on plans, composed by Messrs. Molera Davis and Harkness as the basis of their operations."

The general plans have been changed in many particulars, specially the front of the building. The late Mr. Lick in his deed of the Market street property, and subsequently on the deed of trust, expressed his desire that the Academy's building should be of a classical design. In deference to that wish and according to their own ideas the committee designed the front of the Academy with classical elements. The architects have changed it for a front on the so-called Romanesque style, the reasons for the changes are that it is difficult to design buildings of more than two or three stories high with classical lines. For an Academy of Sciences, it would have been better to adopt a classical front than one in a style the best recommendation of which being its novelty. That buildings with classical orders and several stories high can be built with handsome fronts is numerously exemplified both in Europe and in this country, and conspicuously so in the recently completed Drexel building in New York ten stories high, which is one of the grandest and and handsomest buildings in America. However, the Academy of Sciences front is a fine one and in combination with the splendid materials used in its construction, will do credit both to the Association and the architects.

E. N. SHAW, in an article published in the *Architect* (a London periodical) says the contents of a building have undoubtedly much to do with its safety or danger, but in estimating the whole risk, the materials of which the building is constructed must never be put out of consideration. Every building cannot be erected with brick column and groined arches, but there is a vast range between these and the miserable cast iron pots too commonly to be seen, many of which have been put in without having been tested for strength even at the ordinary temperature of the atmosphere, much less at that of a fire. The following illustration may be given of a fact well-known to all firemen of experience, but seldom proved by demonstration for those not specially interested.

A fire occurred in a warehouse of enormous proportions and raged with great fury for five hours, at the end of which time it was extinguished, and a very large proportion of the building and its contents saved. The warehouse was constructed of brick walls; it had wooden floors supported on wooden beams, which in their turn were carried on wooden story posts about 12 inches thick, and, although serious damage was done, not one portion of the heavy wood-work was destroyed. After the fire, the proprietors allowed the chief of the fire brigade to remove one of the story posts, with a section of the beams and other parts surrounding it above and below.

This post had been subjected to the full action of the fire during the whole of its duration, as already mentioned, or, making full allowance for everything, including the delay of the fire attacking the particular spot on which it stood, and the time at which the cooling process commenced, certainly not less than four and a half hours. As large quantities of water had been used, and it was probable that every thing had been saturated, the wood was carefully dried before a strong fire until not a trace of moisture remained in it. It was then set on end in an open yard, exactly as it had stood in the warehouse, with the pedestal underneath, the cap above, and the beam across the cap, more than a ton of shavings, light wood and heavy wood were placed around it, and after the whole heap was saturated with petroleum, a light was applied to it, and after this, large quantities of petroleum and turpentine were pumped on it. At the end of two and a half hours the post, beam and other parts were withdrawn from the fire, and within a few minutes from the time they were withdrawn they ceased to burn. A few feet were then sawn off horizontally, at that part which had suffered most from the flames, and afterward the same piece was split longitudinally with steel wedges, in order to examine its condition.

The post was of pitch pine, about the most inflammable wood known, and yet after exposure for seven hours to fire, the fury of which could not be exceeded except in blast furnaces, it contained within a quantity of perfectly uninjured and apparently fresh wood, probably capable of supporting the whole weight the original post was designed to carry. Immediately after the saw cut, and again after the cleating with steel wedges, the centre was carefully examined, and found to be just perceptibly warm to the touch, but nothing more, thus proving that the fibre, in which the strength lay, was quite uninjured.

A new work has been laid on our table entitled: A Manual of Machine Construction for Engineers, Draughtsmen and Mechanics, by John Richards, Esq. The summary of contents are: Machine Design, The Transmission of Power, Steam Machinery, Hydraulics, Process and Properties, Tables and Memoranda. It is well illustrated with clean cut drawings of machinery on a large scale, and contains tables and formulæ seldom found in technical works, the use of which will greatly lighten the office labor of the engineer. It is bound in strong, flexible covers and so arranged that it can be used with one hand while working with the other. Publisher's price, $5.00.

AT the recent meeting of the National Electric Light Association at Niagara Falls, considerable time was taken up by the reading of papers and the discussions of the requirements for buildings intended for this purpose. Mr. M. D. Law read a paper, giving his view of certain necessary details for a model building, which should be of brick or stone, substantial, and not more than two stories in height, and as near fire-proof as possible. The boiler room should be located on the ground floor with plenty of ventilation, and the fire room cool and comfortable. It being necessary to keep engines, shafting and dynamos as cool as possible good ventilation should be provided therefore. The dynamo room should be directly over the shafting lines, well lighted and the ventilation perfect. The roof should be constructed without intermediate posts or supports, and of sufficient height and strength to support an overhead track, so that dynamos or armatures can be hoisted and carried over the ones that may be running. A cupola should be provided with window ventilators extending the full length of the two sides, and so arranged as to be under the control of the machine man; the line wires being run from this cupola as required. A store room of good size should be provided and fitted up with closets, drawers and shelves. The workshop should be suitable for lathe and benches.

Mr. G. T. Henthorn gave a detailed description of a new station building at Providence, R. I.

Those wishing to continue the subject will find a full description in the issue of August 17th of the *Western Electrician* of Chicago.

The Kearny street property owners and business men have petitioned the Board of Supervisors to have that street paved with bituminous rock. The Street Committee of the Board has approved the petition and ordered specifications for the work to be prepared. The laying of this pavement on one of our principal streets will be a long step in the right direction, for besides the advantage of noiselessness this pavement requires but a fraction of the traction power necessary on the uneven cobbles and basalt blocks with which our main business streets are now disfigured.

In new apartments. The Technical Society and the Astronomical Society of the Pacific Coast have rented the large rooms adjoining the offices of this Journal. These spacious rooms are light, airy and convenient, and will be open at all times of the day to the membership of these societies. We congratulate them on their new departure and welcome them to all the benefits.

Magnitude in Architecture.

MAGNITUDE is the great object and result of design, and this quality is only to be attained by the fine adjustment of relative proportions in magnitude and order. Architecture (says Aristotle) consists in magnitude and order. The works of man, compared with those of Nature, display our insignificance. The Pyramids, seen in the clear sky of Egypt, or St. Peter's at Rome, are proverbially disappointing to the first gaze of the beholder; it is only after he has instituted comparisons and measurements that he becomes sensible of the greatness of these human efforts—and his memory will supply him with many instances in which objects of inferior dimensions have surpassed them in impression of magnitude upon his mind. It is plain, therefore, that art alone can produce the full effect of magnitude, and to this the architect should direct all his skill; the ancients will be found consummate masters in this as well as in every other department of our art. It is, indeed, a fine art which enables the accomplished artist to raise ideas of magnitude and grandeur of composition on a piece of paper no bigger than your hand; while a less able one will cover a vast canvas without executing any comparable notions. Worthy of all inquiry and solicitude is such an art, for is the whole art of design and proportion. Pliny cities a statue of Hercules, so small that it might be lifted by the hand, which, however, conveyed more grandeur, magnitude and strength to the mind of the observer than a Colossus would have done. How great must have been the science of the master! And if, with such small means, he could effect the mind with these impressions, how great the economy of cost and material to the employer!—C. R. Cockerel, in *The Architect*.

Treatment of Ceilings.

THE ceiling is perhaps the part of an apartment that calls most loudly for decoration, and no architectural feature is more susceptible of it, where it might be introduced with more effect or give more pleasure to the inmate; yet this feature we almost invariably neglect. We naturally look up for beauty; however lovely the earth the sky both night and day presents us with greater charms; we are cheered in our outdoor hours by its ever changing picture, for which a flat white plane is a miserable substitute in our indoor life. To houses of the very highest class these remarks will apply, for it is a feature which has not had its due proportion of attention in point of decoration in any class of buildings, from the cottage to the palace. There certainly can be no more fitting place for decoration in the habitation of a being created upright. Can inconsistency be more extreme than that presented by thousands of apartments where a rich, elaborately decorated carpet is under the feet, and a plain, dead, flat ceiling above? In the interior of Arabian buildings the ornaments almost invariably become richer, more delicate and minute, as their height from the floor increases, and the most exquisite productions of the artist are lavished on the ceiling. With respect to the form the curve is at all times preferable to the flat, though the latter by various means is capable of great beauty also. No very great additional height is required in order to have a curved ceiling, as whether coved or segmental the rise need not be very great. For rooms of great pretension there is no form more noble and natural than the vault and dome, particularly the latter, whether hemispherical or segmental, as far as it suits the plan or can be adapted by pendentives or otherwise. It is the best substitute for the blue vault of the sky, the starry concave of the heavens. It was a fine idea of the builders of the mosque of St. Sophia at Constantinople — a conception in advance of ours—to make the curve of its dome so flat that it should seem to correspond with that of the sky, and be a portion of the firmament. We want an enlarged, improved, enriched, and at the same time inexpensive system of interior decoration, for domestic and ecclesiastical, commercial and other buildings, in our Anglo-Classic styles. For churches, collegiate and other buildings in the Pointed style, we have examples in our cathedrals and other buildings, which prove that the genius of interior decoration was once among us, as well as the taste to employ it. At Henry the Seventh and King's College Chapels; the oratory at Beauchamp Chapel; the Temple Church; Wolsey's Hall, Hampton Court; Christ Church Hall, Oxford; Westminster Hall, and others, we have ceilings and roofs that might vie with any that Europe could show. For assistance in evolving a system of Classic decoration we might look to some parts of the Continent. Exterior decoration there has sometimes probably been carried too far, a few Continental edifices exhibiting ornaments so minute and fragile as to seem at least unfit for exposure to the weather in any climate. But this could not be said of interiors. The Moorish or Morisco-Spanish architecture suggests to us what richness might be produced by very simple means; their icicle pendents, inlays and casings, and purely geometrical and imaginative ornaments, are very effective, and with them they often produced greater results than we, with all nature to imitate, have attained to. But the art of interior decoration was better understood and more successfully practiced in the great age of modern art in Italy, and indeed throughout the Middle Ages, than at present in any country. We never had any decoration to be compared with the mural and fresco paintings of the Italians, and there is probability in the supposition that their system was obtained from remains of the ancients, which time or violence has not spared to us. Beside the curved and richly emblazoned ceilings produced by the Italians, and the pictorial embellishment of their walls, ours might symbolize poverty itself. The ceilings of the principal apartments of a Roman, Genoese, Venetian or Florentine palace were considered as most important features, and on their designs and executions the highest talent was employed. In ecclesiastical buildings the contrast with ours would be still greater. Whilst the interior of the churches of Italy glow with every rich hue of the marble quarry, and are virtually galleries of art, what is the aspect of ours?—*London Architect.*

The September number of the "*House Painting and Decorating,*" a monthly publication comes to us in a wonderfully improved appearance. We commend all our patrons to subscribe at $1 00 a year. Address 1130, 35th street, Philadelphia.

Architectural and Mechanical Works.

In our list below will be found the names of books on architectural and mechanical subjects, the prices of which have been greatly reduced if taken in connection with the California Architect Old subscribers will be given the books at a large discount, so that they may feel that no favoritism is shown. It will be noticed that some of the books are given free to new subscribers.

	Price of Book.	With *Cal. Architect.*
Mechanics' Geometry	$5 00	$5 57
Monckton's National Carpenter	5 00	5 75
Cottages	1 00	5 40
Shavings and Saw Dust	1 50	2 75
Moore's General Assistant	2 50	2 25
Plaster and Plastering	1 00	3 40
Hand-Book of Legendary Art	3 00	2 75
Manual for Furniture Men	1 00	3 40
Water Closets	1 50	2 40
Cutting Tools	1 50	2 00
Sewer Gas and Its Dangers	1 25	3 50
Handrailing and Staircasing	1 25	2 75
Sloan's American Houses	1 50	2 75
Amateur Mechanic's Workshop	1 50	2 00
American Cottage Builder	3 50	3 00
Wheeler's Rural Homes	1 50	4 00
Burns' Ornamental Drawing	1 00	3 40
Manual of Drawing for Carpenters	3 00	2 00
Steam Engine Catechism	1 00	4 40
Grimshaw on Saws	4 00	2 75
Modern Low-Cost Houses	50	4 00
A Cosy Home	25	2 00
California Picturesque Architecture, No. 1	3 00	4 00
California Picturesque Architecture, No. 2	3 50	4 25
The Artisan	5 00	5 75

The following are justly recognized as standard publications. Some of them are perfectly new works, but we make the same general reduction:

	Price of Book.	With *Cal. Architect.*
Tredgold's Carpentry	$ 7 50	$ 8 25
Building Construction, 3 vols., Smiths	14 00	14 75
Picture-Making with Pen and Ink	4 00	5 25
New Cottage Homes and Details (Palliser's)	4 00	5 25
Palliser's New Quarterly, per year	3 00	4 00

We can furnish any book printed at publishers' prices, and will send all books free by either mail or express.

High Houses in London.

A proposal to restrict the height of houses in London has been brought before Parliament by Mr. Whitmore, M. P. The scheme makes a distinction between streets less than sixty feet in width and those of greater width. In the former streets buildings are allowed to be erected up to sixty feet in height, but no more, except in the case of churches or chapels. Where the street or place is wider than sixty feet, the height of the building must not exceed the width of the street or place. If, however, the consent of the county council be obtained, this height may be exceeded. And, without such consent, the height of any building so erected may not be at any time subsequently increased so as to exceed the width of the street. It is made the duty of the district surveyor of the county council to inform the Home Secretary of any building intended to be erected contravening the provisions of the bill. The main object of the bill is to give to the county council powers to restrict the excessive height of buildings in existing streets in London. The county council has such powers in the case of new streets; but in the case of existing streets it is said that neither the county council nor any government department has any power to restrict the height of buildings.—*London Times.*

We notice an article on slow burning construction in the September number of the *Overland Monthly* by M. J. Bugbee of this city, which advocates an entire change in the building of houses. Mr. Bugbee contends that a radical improvement can be made by architects and builders in the erection of buildings which will make them almost fireproof, while the cost of the method will be increased not more than 8 per cent above the present rates.

THE New York *Times* publishes a long and earnest editorial about the new Municipal Court building for that city, expressing the opinion that a building erected in accordance with the selected design will be "discreditable to the city and to the commissioners who authorized its selection." That the idea of matching the architects against each other to see who would do it for the smallest percentage on the cost put the city in an "undignified and ridiculous position," and that the best way would be to appoint a new jury of real experts to examine all the designs over again, and if it should find that the one selected was really the best, to get up a new competition which would attract men capable of making better ones. Of course it is very unlikely that this advice will be followed, particularly as the commissioners have already bound the city to the architects whom they have selected by a contract which it would be a costly and difficult undertaking to break; and we cannot but regret that the *Times* should not have expressed its very judicious views before, not after the competition was decided. If a few daily papers so able and influential as the *Times* would come to the aid of the technical press in helping people to understand, before important competitions, the conditions which all architects of character consider essential to a fair contest, and the reasonableness and moderation of these requirements, the disgusts, disappointments and losses which attend nearly every public competition might be saved. The conditions are very simple. Nothing more is needed than to engage that the work shall be carried out, or if not, that a suitable compensation shall be paid the architect selected for the first place; that if it is carried out the author of the most meritorious design shall be employed to execute it at the customary commission of 5 per cent on the cost; that the award shall be made under the advice of one or more architects known to the profession as competent judges; and that time enough shall be allowed for men actively employed in other work to prepare, and carefully study, drawings, the nature of which shall be exactly stated in the programme. The original invitation of the Sinking Fund Commissioners allowed a very short time, about seven weeks, we think, for the preparation of a design which could not be properly studied under about as many months by an architect in ordinary practice, and no promise was made that experts would be employed to pass upon the merits of the designs. The consequence was that most architects of standing, after reading the programme, threw it into the waste-basket, where the programmes of public competition generally go in good offices, and for the same reasons; and the field was left, as it usually is, to the few people who are willing to do themselves the injustice of getting up a crude, hasty sketch, and committing it to fortune, without any assurance that it will be fairly judged.—*American Architect.*

Flash-light photography is being used by the sanitary inspectors of New York to obtain graphic pictures of the overcrowded condition of the tenement houses of that city.

Cabots' Creosote Shingle Stains on Redwood.

"The use of Cabot's Creosote Shingle Stains in California is on the increase. We note that they have been recently used on the hotel Vendome at San Jose, and on Judge Venves residence at Los Gatos. In both of these cases they were used on redwood, and the architects, Jacob Lenzen & Son, San Jose, and the painters J. P. Jarman & Co. of the same city, write that they give perfect satisfaction, and that they cheerfully recommend them for similar work."

At the time the consolidation of the American Institute of Architects and the Western Association was decided on, the executive officers of the two bodies were instructed to meet, choose the time and place, and call a joint convention. There has been great delay in the matter, from the fact that differences of opinion exist as to the best place for the convention to meet. The secretary of the Institute advocates Washington, for the reason that it is neutral ground, while the president of the Western Association favors some city that is the center of the great business and commercial interests.

Straightening Walls of Buildings.

THE weight of the roof of the large gallery of the Conservatoire de Arts et Metiers pressed the sides outward so as to endanger the building, and it was requisite to find means by which the wall should be propped so as to sustain the roof. M. Molard contrived the following ingenious plan for that purpose: A series of strong iron bars were carried across the building from wall to wall, passing through holes in the walls, and were secured by nuts on the outside. In this state they would have been sufficient to have prevented the further separation of the walls by the weight of the roof, but it was desirable to restore the walls to their original state by drawing them together. This was affected in the following manner: Alternate bars were heated by lamps fixed beneath them. They expanded, and consequently the nuts, which were previously in contact with the walls, were no longer so. These nuts were then screwed up so as to be in close contact with the walls. The lamps were withdrawn and the bars allowed to cool. In cooling they gradually contracted and resumed their former dimensions, consequently the nuts, pressing against the walls, drew them together through a space equal to that through which they had been screwed up. Meanwhile the intermediate bars were heated and expanded and the nuts screwed up as before. The lamps being again withdrawn, they contracted in cooling and the walls were further drawn together. This process was continually repeated, until at length the walls were restored to their perpendicular position. The gallery may still be seen with the bars extending across it and binding together its walls.

CITY BUILDING NEWS.

Broadway bet. Pierce and Scott. Owner, Wm. Thomas; architect, Wm. F. Smith; contractor, G. V. Hussey; cost, $3,851; sureties, Frank P. Latson and J. H. Wilson; filed Aug. 12; signed Aug. 2; limit, 4 months; to build $725.75; framed $795.75; covered in $725.75; plastered $725.75; completed $988, 35 days.

Brannan bet. Fifth and Sixth. Owner, Hermann Zweig; architect, W. Winterhalter; contractors, Brennan & Fladung; cost, $3,360; sureties, O'Connell & Lewis, $3,000; filed Aug. 13; signed Aug. 12; limits, 35 days; additions to South Park Malt house $300; first story up $800; third story up $800; completed $360, 35 days.

Broadway and Pierce. Owner, Julius Weber; architects, Percy & Hamilton; contractor, J. B Gonyean; cost, $3,145; sureties, C. A. and Geo. W. Hooper, $2,500; filed, Aug. 21; signed, Aug. 15; limit, 90 days; 2-story frame; 75 per cent as work progresses on first Saturday of each month; balance, 35 days.

Brannan, bet. Fifth and Sixth, South Park Malt House. Owner, Herman Zweig; architect, W. Winterhalter; contractor, W. Hurve; cost, $2,115; sureties, David Werner and Otto Fauss; filed Aug. 19; signed Aug. 12; limit 42 days; alterations; $500 to be fed; $500 tinning done; $500 completed; $515 35 days.

City Hall and Park avenue. Owner, Geo. T. Marye, Jr.; arcsitect, Wm. F. Smith; contractor, J. H. Wilson; cost, $18 400; surety, Willis H. Davis; filed Aug. 22; signed Aug. 13; limit 6 months; mason work, $1,750 graded; $4,250 first floor joist on; $8,650 second floor joists on; $3,650 roofed; $500 tiled; $4,600 35 days.

City Hall and Park avenue. Owner, Geo. T. Marye, Jr.; architect, Wm. F. Smith; contractors, Duffy Bros.; cost, $1,990; filed Aug. 22; signed Aug. 13; limit six months; plumbing; $1,000 rough work is tested; $400 completed; $490 35 days,

Church and Twenty-first. Owner, S. Slemmer; architect, Wm. Mooser; contractor, Wm. S. Lott et als; cost $4,000; sureties, J. E. Wells and Jos. Paudler, $2,200; filed Aug. 30; signed Aug. 28; limit 70 days; to build; $750 framed; $750 ready for lathing; $750 rear platform up; $750 completed; $1,000 35 days.

City Hall and Park avenue. Owner, Geo. T. Marye, Jr.; architect, Wm. F. Smith; contractor, S. H. Kent; cost, $9,675; surety, Edward P. Blake; filed Aug. 22; signed Aug. 13; limit six months; carpenter work, $1,000 second story joists on; $2,000 roof is tinned; $1,500 ready for plaster; $2,956 completed; $2,419 35 days.

City Hall and Park avenue. Owner, Geo. T. Marye, Jr.; architect, Wm. Smith; contractors, O'Connell & Lewis; cost, $6,000; surety, Jeremiah Mahony; filed Aug. 22; signed Aug. 13; limit six months; cast iron; $2,250 basement column cast; $2,250 first story columns set; $1,500 35 days.

City Hall and Park avenue. Owner, Geo. T. Marye, Jr.; architect, Wm. F. Smith; contractors, Bigelow & Little; cost, $,876; surety, Oscar Lewis; filed Aug. 22; signed Aug. 13; limit six months; iron and Hyatt lights for sidewalk; $1,150 iron beams all set; $1,757 Hyatt lights completed; 6963 35 days.

City Hall and Park avenue. Owner, Geo. T. Marye, Jr.; architect, Wm. F. Smith; contractor, C. C. Morehouse; cost, $1,622; sureties, Jno. Tuttle; filed Aug. 22; signed Aug. 13; limit six months; plastering; $800 brown coated; $400 completed; $422 35 days.

Clay, bet. Powell and Mason. Owner, C. Colette; architect, W. H. Armitage; contractor, Francis Buckley; cost, $5,800; surety, L. A. Maison, $5,000; filed Aug 10; signed Aug. 5; limit 75 days; 3 story frame; $1,450 framed; $1,450 brown coated; $1,450 completed; $1,450 35 days.

Dale Place and Golden Gate Ave. Owner, Andrew Heneberry; architect, A. J. Barrett; contractor, C. N. Smith; cost, $2,360; surety, Frank P. Latson, $1,000; filed Aug. 5; signed Aug. 1; limit, 60 days; alterations, etc., 75 per cent to be paid as work progresses, bal. 35 days.

Devisadero and Haight. Owner, Anita Fallon; architect, Fred E. Wilcox; contractor, John H. McKay; cost, $8,620; sureties, Frank P. Latson and Geo. T. Shaw, $4,310; filed, Aug. 21; signed Aug. 19; 3-story building; $2,155 framed; $2,155 brown coated; $2,155 completed; $2,155 35 days.

Eighteenth and Noe. Owners, Annie Loy and husband; architect, Frederick Miller; contractor, Wm. McPhee; cost, $2,600; filed Aug. 16, signed Aug. 14; limit, 70 days; building $600; enclosed $2,000, 35 days.

Ellis and Gough. Owner, Jacob J. Rauer; architects, Chas. R. and John M. Wilson; contractor, James Geary; cost, $9,375; filed Aug. 7; signed Aug. 6; brick and carpenter work for a 1-story frame $1,000; first story joists on $1,200; roof on $1 200; brown coated $1,831; white coated $1,800, completed—

Ellis and Gough. Owner, Jacob J. Rauer; architects, Chas. R. and John M. Wilson; contractor, R. A. Vance; cost, $1,140; filed Aug. 7; signed Aug. 6; plumbing, etc. $570; rough work in $285; accepted $285, 35 days.

Ellis and Gough. Owner, Jacob J. Rauer; architects, Chas. R. and John M. Wilson; contractors, Chattain & Gillett; cost, $2,245; filed Aug. 7; signed Aug. 3; cement work, 75 per cent as work progresses, bal. 35 days.

Front and Vallejo. Owner, Mrs. E. B. Sanborn; architects, Wright & Sanders; contractor, John S. Mackay; cost, $17,653; filed Aug. 13; signed Aug. 12; brick building and construction of iron safe, 75 per cent of work done, bal. 35 days.

Fourth and Bluxome. Owner, Peter A. Smith; architect, T. J. Welsh; contractor, John J. Dunn; cost, $5,977; sureties, Behrend Joost and W. A. Messer, $3,000; filed Aug. 10; signed Aug. 5; limit 77 days; carpenter work; $1,400 framed; $2,400 brown mortared; $1,6 0 completed; $1,577 35 days.

Fulton and Buchanan. Owner, N. B. Manville; architect; N. B. Manville; contractor, I. F. Klenck; cost, $1,875; filed Aug. 15; signed Aug. 13; limit, 2 months and 20 days; 2-story building $450; framed $465; plastered $475; completed $485, 35 days.

Fair Oaks bet. Twenty-third and Twenty-fourth. Owner; Jos. Perri; architect, T. F. Mitchell; contractor, Thos. F. Mitchell; cost, $2,980; filed Aug. 3; signed Aug. 3; limit, 70 days; 2-story frame $745; framed $745; brown mortared $745; completed $745, 35 days.

Franklin and Ellis. Owner, Academy of Sacred Heart; architect, Chas. J. I. Devlin; contractor, John Massey; cost, $4,650; sureties, J. J. and James McKinnon, $2,500; filed Aug. 22; signed Aug. 20; limit 60 days; 2-story frame; $750 second story joists on; $1,000 roofed; $1,725 completed $1,175 35 days.

Folsom and Seventh. Owner, Thos. Brady; architect, M. J. Welsh; contractor, Ivory Wells et al; cost, $1,700; filed Aug. 23; signed Aug. 21; alterations; $400 framed; $450 brown coated; $450 completed; $400 35 days.

Folsom and Twenty-sixth. Owner, Jos. Blass; contractor, G. Pavel; cost, $8,360; filed Aug. 23; signed Aug. 10; limit 90 days; 2-story frame; $1,000 framed; $1,000 brown coated; $1,000 completed.

Fulton and Octavia. Owner, John McCarthy; architect, S. Hatfield; contractor, Geo. W. Farnum; cost, $3,495; sureties, F. Joost and Matt Lassell, $4,000; filed Aug. 8; signed Aug. 7; 3-story tenement; $1,000 framed; $1,500 chimneys up; $1,400 wind ws in; $1,495.25 comp eted; $1,795 35 days.

Fell and Laguna. Owner, Robert Layng; contractor, Geo. W. Saulsbury; cost, $2,476; sureties, Daniel Dodge and Edward P. Blakely; filed Aug. 9; signed July 27; limit, Oct. 15, '89; to build; $686.50 framed; $685.50 enclosed; $686.50 brown coated; $686.50 35 days.

Folsom, bet. Twelfth and Thirteenth. Mrs. B. Feldmann; architects, Townsend & Wyneken; contractors, Gray & Stove; cost, $4,244; surety, Louis Mandlebaum, $2,000; filed July 19; signed July 12; limit 90 days; to build; $2,144 outside two-thirds done; $2,100 35 days.

Greenwich and Fillmore. Owner, Peter Magnussen; architects, John & Balczynski; contractors, Chas. Johnson et al; cost, $2,700; filed Aug. 20; signed Aug. 16; 2-story frame; $500 framed; $800 rough mortared; $795 accepted; $675 35 days.

Grove, bet. Franklin and Gough. Owners, Schuseler Bros.; architect, H. C. Macy; contractors, White Bros.; cost, $5,600; surety, F. Joost, $2,500; filed Aug. 20; signed Aug. 19; limit Oct. 2; '89; carpenter work: 75 per cent as work progresses; bal. 35 days.

Grove and Franklin. Owner, Jane Bosby; architect, Chas. J. I. Devlin; contractor, W. B. Anderson et al.; cost, $5,087; sureties, J. F. Kennedy and Geo. T. Shaw, $4,000; filed Aug. 12; signed Aug. 7; 3-story frame $300; framed $600; roof completed $1,000; brown coated $750; exterior mill work completed $900; ready to paint $850; completed $1,287, 35 days.

Hickory and Van Ness Ave. Owner, Emily L. Squire; architect, A. J. Barrett; contractor, L. D. Frichette; cost, $2,700; surety F. G. Norman, $1,000; filed Aug. 6; signed Aug. 2; limit, 75 days; 2-story frame $700; roof boards on $850; brown coated $675; completed $675, 35 days.

Hayes and Octavia. Owner, O. H. Hunt; architect, A. C. Lutgens; contractor, S. H. Kent; cost 8,299; sureties, E. M. Herrick and Frank P. Latson, $5,000; filed Aug. 13; signed Aug. 8; limits, 95 days; 3 story frame $1,000; first story joists up $1,300; enclosed $1,300; rough plumbing done $1,200; outside work done $1,424.25; completed $2,074.75; 35 days.

Hayes and Gough. Owner, Albert Abrams, et al.; architects, Salfield & Kohlberg; contractors, Fuchs & Bucher; cost, $8,612; sureties, H. Niemann and H. Schlesselmann, $8,612; filed Aug. 8; signed Aug. 6; alterations, etc. $1,250; first joists up $1,000; framed $2,000; brown coated $1,000; doors hung $1,299; completed $2,153, 35 days.

Hayes and Webster. Owner, P. Hurley; architect, W. H. Armitage; contractor, C. A. Laherty; cost, $3,690; sureties, J. McGuire and O. H. Greenwald, $3,000; filed Aug. 25; signed Aug. 22; limit 60 days; 2-story frame $922.50 framed; $922.50 brown coated; $922.50 completed; $922.50 35 days.

Howard and Sixth. Owner, H. Comaherns; architect, H. Geilfuss; contractor, J. W. Smith; cost, $5,375; filed Aug. 16; signed Aug. 14; 3-story frame $800; framed $800; partitions set $800; outside work done $800; inside finished $800; completed $1,345, 35 days.

Howard and Twenty-fifth. Owner, Geo. L. Payne; architect, M. J. Lynch; contractor, M. C. Lynch; cost, $4,966; filed Aug. 4; signed Aug. 7; to build $1,241.50; framed $1,241.50; rough mortared $1,241.50, completed $1,141.50, 35 days.

Herman and Stevenson. Owner, Mrs. M. A. Mercer; architect, T. J. Welsh; contractors, R. Doyle & Son; cost, $5,989; sureties, Thos. Winters and P. F. Ward, $3,000; filed Aug. 22; signed Aug. 16; $1,400 framed; $1,400 framed; $1,400 brown mortared; $1,500 completed; $1,689 35 days.

Jersey and Noe. Owner, F. Mundwyler; architect, A. Klahn; contractor; A. Klahn; cost, $3,150; filed Aug. 12; signed Aug. 12; 2-story flat $775; boarded $775; brown-mortared $775; completed $825, 35 days.

Jones and Bush. Owner, C. F. Sanders; architect, Chas. I. Haven; contractor, Wm. F. Wilson; cost, $1,097; filed Aug. 6; signed July 29; plumbing, etc., $400; rough pipes in $417; completed $280, 35 days.

Residence for J. Columbet on Fifth street $3,000.

The Hayes residence at Edenville, G. W. Page architect, to be built by day work at an estimates cost of $75,000.

Cottage for J. Jacks on Tenth street, from plans made in the mill; J. J. Hill contractor; $2,000.

Two cottages for J. R. Johnson, from mill plans; day work; $2,500 each.

A cottage on North Fourth street near Empire, J. N. Stevenson, contractor and architect; $2,000.

A winery for Mr. Blennike on the Stevens creek road, by day work; $3,000.

Cottage for J. K. Smith, on Marliere street; Ira Hazzard contractor; $1,200.

Cottage for C. Ballinghall, on Willow street; day work; $1,000.

Residence for Tom Hughes, on Thirteenth street; day work; $1,000.

Residence on San Fernando street near the bridge; J. A. Crawford builder; $1,000.

Residence on Villa avenue, D. D. Briggs contractor; $1,500.

Cottage for M. A. Brown; cost $1,200; Hazzard contractor.

Cottage of four rooms for Dr. Rappe; $1,500.

J. B. Capp is having a ten room house placed on his lots at a cost of $5,000; Hazzard contractor.

A $3,000 cottage for Benjamin Rordeau is to be erected by Mr. Hazzard.

W. E. Woods is having built a five room cottage; cost $1,200; Hazzard contractor.

An eight room house is being built for M. A. Wischaar at a cost of about $2,500.

O. O. Noble is having a six room cottage built at a cost of $1,300; Hazzard contractor.

C. A. Blewitt is having a five room cottage built at a cost of about $1,100; Hazzard contractor.

Contractor Hazzard also begun yesterday on a handsome six room cottage corner of First and Floyd street:, which is to cost $2,500.

Harry Keist is having a five room cottage built at a cost of $1,000.

Mr. Souders, the owner of the Water Works, is also building a cottage to cost about $1,000.

SANTA ROSA.

Contractor J. R. Melson commenced the erection of a dwelling for D. Hodgson on Slater street.

T. J. Ludwig has commenced the completion of the brick block on Fourth street.

GRASS VALLEY.

S. T. Best's new dwelling house on Race street, near Auburn, is approaching completion. It will be neat architecturally as well as conveniently arranged.

Lumber for a residence for John Polkinghorn was hauled to-day to the Conaway tract on Race street.

Bennetts is building an addition to his dwelling corner School and Walsh streets.

Contractor I. T. Walker is making rapid progress with the large building he is putting up at the corner of Mill and Neal streets.

SAN FRANCISCO, CAL.

Architecture.

In architecture, an art in which nothing but brains can excel, an art which requires years of study, an art which has no standard of grace but which is directly dependent on utility, an art whose creations derive a part at least of their majesty by mere sizes, our city can boast of many talented men, men who have lent to the city of to-day their creative talents and in the handsome, massive and magnificent buildings which line our streets,and in the palatial residences in every section we see evidences of their skill which would reflect credit on any city in the country.

From the low frame buildings of 1849, of any style and built of any kind of material, the advance has been rapid and steady

One frame or flimsy brick building after another has been replaced by handsome, substantial structures until the city to-day presents as handsome an appearance as any city in the country. Every section of the country has its peculiarities and the architecture of each portion generally conforms to the climate, and the individuality of its people.

In San Francisco where sunlight is so essential to the comfort of a building, and where precaution must be taken against earthquakes, as against cyclones, snow and severe winters in other sections of the country, our local architects have mastered and overcome the difficulties attending and are certainly through their long experience and study in overcoming them, better fitted to draw plans and design buildings of a first-class nature than those of more eastern points, for this section. Evidences of their skill to erect first-class fireproof and earthquake proof buildings are every where apparent in this city and throughout the state, and many of our architects would attain prominence in any city in the country.

As in architecture, so in building,material has there been a decided improvement and except in rare instances do we find the old frame being put up instead of a brick or stone building with possibly the exception of residences.

The time has gone by when a property owner covered his lots with badly designed and badly constructed buildings provided he could fill them with tenants. He to-day has his buildings constructed in accordance with the most approved principles of modern architecture uses the best and most improved building material and he finds when his building is complete he can obtain tenants much more quickly and his building commands a much higher rental than the old and illy constructed buildings of former years. While the old-fashioned buildings are in many cases unoccupied, the buildings erected within the past few years with every modern convenience and built on the newest and approved plans of architecture are filled with first-class tenants and in many instances rented before entirely completed. In this issue,a number of illustrations are given of buildings erected by some of our leading architects, accompanied by a short biography.

These building show the various types of architecture of the city, in public buildings, residences and business blocks, each of them being models of their kind.

Percy and Hamilton.

G. W. Percy was born at Bath, Maine, July 5th, 1847. Having completed his education, in 1866 he entered the office of F. H. Fassett, architect, at Portland, Maine, after the great fire which had destroyed that city. Remaining there three years he removed to California in September, 1850, and located at Stockton where he practiced his profession until April, 1872, when he went to Chicago and entered into the employ of J. M. Van Osdell & Co., architects, of that city. He servad with them during the busy years of rebuilding Chicago's burnt district until May, 1873, when he went to Boston, serving as Superintendent of Construction for Bradlee & Winslow.

In September, 1875, he returned to California and opened an office in this city, doing business alone until January, 1880, when he entered into partnership with F. F. Hamilton under the present firm name.

F F. Hamilton was born in Addison Maine, in 1851. He studied his profession under Professor Hammitt Billings, a prominent architect of Boston, entering his office in 1867, and also served with several other prominent architects of that city until 1872 when he formed a partnership with J. B. Samuels, the firm being J. B. Samuels and F. F. Hamilton. They were the architects for several prominent buildings and erected numerous churches in Boston and vicinity. In September, 1875, he came to California and located in this city, being employed upon the new City Hall for three years. In 1878 he took a trip East, returning here again in 1879, and in 1880 formed the present partnership.

Among the prominent buildings erected by this firm are the State Insane Asylum Buildings at Stockton, Masonic Hall, Sperry Flouring Mill, Crown Flour Mills, all at Stockton. The Academy of Sciences (illustrated in this number), the Children's Play House at Golden Gate Park, new First Unitarian Church, corner of Franklin and Geary, Hayward's Apartment House on Larkin street, opposite the new City Hall, Hayward's Block on Sutter above Kearny, the Omnibus Cable Co.'s new car house corner Tenth and Howard, the engine house of the same company on Oak and Broadway, the largest of its character in this city, the buildings of the California Electric Light Company on Townsend and Clarence place and on Stevenson street; the Cunningham Building corner of Second and Stevenson, A. Hayward's magnificent residence at San Mateo, and numerous others in this city and different parts of the State.

Wm. Mooser.

The subject of this article is one of the oldest and best known architects in San Francisco.

He is a native of Switzerland, but came to California at the age of twenty years, arriving here in 1854. One of his first ventures in this country was his employment at the Navy Yard, in designing naval structures, and he has ever since been connected with the building interests of this city, Sacramento and Virginia City, at which latter city he erected the first brick buildings of any importance, such as the M. E. Church, Medine's Block, Wood & Wilson's and Wells, Fargo & Co., buildings.

From Virginia City, Mr. Mooser came back to San Francisco where he has been established ever since and in which place he has erected a large number of private and public buildings. In 1861, he with several other architects founded the San Francisco Architectural Society, and he is to day with the exception of one, the only charter member still actively engaged in the profession. Some of the most important buildings erected under his supervision, are as follows; The Metropolitan Temple, illustrated in this number, K. of P. and Pioneer buildings and Veranda Block, now in course of construction.

At Rutherford station, Mr. Mooser displayed his ability in constructing the famous cellars for The "Inglenook" Vineyard, for G. Niebaum, they being the first of their kind on the Pacific coast constructed almost entirely of concrete.

A. J. Barnett

Was born in St. Louis, Missouri, in 1853, and learned his profession with his father, G. R. Barnett, a prominent architect of St. Louis. He first came to this city in 1874, practiced here awhile, and then went to Chicago, being there associated with A. H. Piquenard, returning to his native city in 1882. He entered into partnership with his father, the firm becoming Barnett & Son, and while there was the architect for several prominent buildings. Finding the western country a better field for his talents he left for Portland, Oregon, and finally came to this city in 1883, since which time he has practiced here continually.

Among the many buildings built by him we mention the following: Oriel block, corner Market and Franklin; Green Valley Stables on Mission and Fifth, the largest livery stable in the city; the residences of Frank P. Dow, Laguna and California; F. T. Black, corner Page and Webster; E. W. Joy, Van Ness Avenue; E. Goggin, Van Ness and Jackson; Simons, Jacobs & Co.'s block a Merced, Cal.; a number of flats for D. W. Parkhurst; the Van Winkle lodging house, corner Turk and Jones; two residences for James P. Dunn at Leavenworth and Jackson; and the Oriel row of thirteen houses on Haight between Webster and Buchanan, of which we give an illustration. This row of houses has the distinctive architectural feature of each house differing from the other in design, no two being alike, the whole still harmonizing, and differ from most houses in not having the long flight of stairs so prevalent here. Each is an e even-room house, and so arranged as to admit the sun in all the principal rooms. The row is a very handsome one, and reflects great credit on Mr. Barnett's abilities as an architect.

John M. Curtis,

The well-known architect, was born in 1852 at Warsaw, Illinois. At an early age he was left an orphan and thrown upon his own resources. He evinced great mechanical genius and entered into service with Bent & Garrity, builders and contractors, of St. Louis, Mo, After serving with them he entered the office of Mitchell & Brady, architects, of St. Louis, and studied the profes-

sion of architecture, remaining there until 1874, when he came to California and located in this city where he has remained in active practice ever since.

While he has been here, he has been closely identified as superintendant, builder, and assistant or chief architect of a great number of our largest and finest buildings.

He was assistant architect of the Baldwin Hotel and Theatre; supervising architect of the new City Hall and architect of the Santa Rosa, Sonoma county, Court House; the Mutual Relief building of Petaluma; Santa Cruz county buildings and jail; Wells & Fargo's new building on Folsom near Serond street; the handsome new winery erected by Boyd & Davis, to be occupied by Kohler & Frohling (illustrated in this number) and many other prominent buildings and residences of this city and surroundnig points.

He is a member of the San Francisco Chapter American Institute of Architects, Treasurer of the Pacific Coast Chapter of American Institute, member of the Technical Society of the Pacific Coast, and has gained a high reputation in his chosen profession.

Salfield & Kohlberg.

David Salfield was born at Keysboard, Illinois, in 1861. When but six years of age he removed with his parents to Germany and received his education in that country. He studied his profession in the various architectural schools of Germany, and in 1880 came to California locating in San Francisco. He served as draughtsman for four years with several architects of this city and then formed a partnership with Emil John, the firm becoming Salfield & John which lasted one year. He then practiced alone a year when the present partnership was formed.

Herman Kohlberg was born at Beverungen, Westphalia, Germany, in 1855. After graduating at the High school of Lippstadt, Westphalia, he attended the Polytechnical High school of Brunswick, near Hanover, taking a three years course. He practiced his profession for several years in southern Germany until 1882 in which year he came to the United States. He served in New York city for one year and then came to this city in 1883.

For two years he held business connections with several architects of this city and in 1885 formed the present partnership with D. Salfield. The firm are the architects for quite a number of fine buildings, notable among which are the following: Rosenthal building, of which an illustration is given in this number, the Rosenbaum building, corner of California and Front streets, Hackmeier's Hotel, J. Carstensen's building, 29th and Dolores, Simon Siegel's row of dwellings, five residences for James B. Hall, a fine business building for G. Woerz on Geary street, business house for A. Marx, Klose & Hillenbrand's Hotel, on Valencia street, B. Miller's flats on Post near Larkin, Victor R. Ulman's residence on Clay street, business house and flats for Dr. Abrams on Hayes street and others in various parts of the city. They received the premium for the design of the Court House at Stockton and are the architects for the jail in that city.

Charles I. Havens

Was born on Long Island, N. Y., in 1849, and came to California in 1856, locating in San Francisco. He entered the office of S. C. Bugbee & Son in 1864 and learned the profession of architecture, serving as draughtsman with them for five years. After that he was connected with John P. Gaynor two years and was with P. R. Schmitd for nine years more, entering into partnership with him in 1881, the firm becoming Schmidt & Havens, which continued for five years. During this time they erected numerous prominent buildings in this city and different portions of the State, among which were The Fulton, corner of Fulton and Larkin streets, The Longworth on Geary, the Haines' residence at San Mateo, the De Lavega residence, Geary street, D. N. Walters' residence, corner Sacramento street and Van Ness avenue, and others

On January 1st, 1886, he commenced business for himself, since which time he has been practicing alone.

He has been the architect of some of our largest and most prominent buildings, notable among which are the following: The Carroll block, on Turk and Laguna, costing $45,000; the Hayward residence, corner of Baker and Hayes streets, $25,000; the Gualala Mill Co. building on Steuart street, running through to East street, south of Market, $45,000; H. C. Talbot's residence at San Leandro, $30,000: the Golden Gate Livery Stable, on Golden Gate avenue (illustrated in this number), $80,000; J. J. Wells' residence, corner of Pacific and Steiner streets; Palmer block, on Mission, between Eleventh and Twelfth streets, $25,000; and numerons others of like character.

He is a member of the San Francisco Chapter, American Institute of Architects, and ranks among the highest in the profession.

Henry Geilfuss

Was born in Thurin, Germany, in 1850, and studied his profession in Erfurt, Weimar and Berlin in the different architectural schools of those cities. While in Berlin and Schlessing he practiced his profession principally under railroad officials in constructing bridges and heavy masonry, thus seeing considerable work and thoroughly preparing him for his future career. In 1876 he left his native country, arriving in this city in the same year, where he has been in active practice ever since, working as draughtsman the first two years. Since he has been in business for himself he has been the architect for some of the best buildings erected here. Among the most prominent are the following: Kohler & Van Bergen's Winery on 3d street between Brannan and Townsend, the Wm. Tell House, Bush steet; the U. S. Brewery; the Zwieg residence, corner of Howard and 23d streets; Vanlag residence on Howard, between 16th and 17th; W. Westerfelt residence, Fulton and Scott streets; John Cook's, Howard, between 20th and 21st; Sam. Steiner's residence on Eddy, between Franklin and Gough; the three-story brick building for stores and lodgings for John Van Bergen, corner 3d and Harrison which we illustrate, and many others.

Reid Bros.

Have been located in this city but a short time and consequently have not been identified with her architectural development. They have an enviable reputation in Chicago, Evansville and San Diego, where they have erected numerous buildings which reflect great credit upon their ability as architects.

The Coronado Hotel at Coronado Beach, which is illustrated in this number, is a monument to their architectural ability and is acknowledged as one of the finest hotels in the country.

Slate.

The material to be used for the roofs of buildings is an important item in their construction, as regards durability and resistance to fire.

Slate is gradually and deservedly taking precedence over all other materials for roofing purposes, as it will generally outlast the life of any building; it never requires painting, is a perfect resistance to fire, is storm proof, and imparts much warmth to any building covered with it.

The first cost is only nominally greater than shingles or other destructible material used, and it will outlast any other material fifty to one hundred years, being almost indestructable.

Another advantage of slate roofing is its handsome appearance, as noticed on the fine buildings in eastern cities, where it is almost universally used, besides requiring no painting or repairs, as a roof constructed of slate lasts for years, and therefore is far more economical in the end than the use of material formerly in vogue here.

The California Slate Company, whose offices are located at No. 9 Mission street, are prepared to furnish a superior quality of slate for roofing purposes in any quantities to suit.

Their quarries are located in El Dorado county, and expert architects pronounce the quality second to none, and generally better than any produced in the eastern states or Europe.

They are enabled to furnish any sizes that may be required of an average thickness of three-eighths of an inch. The color is a rich blue black, of fine grain and unusually smooth surface, which imparts to any building a graceful and handsome appearance.

Besides roofing this slate can be used for mantles, sidewalk tiles and general building purposes, and can be quarried large and thick enough for billiard table tops. It admits of a fine polish, and is withal a valuable addition to our building material.

Samples of this company's product can be seen at the Mechanics' Institute Fair, and at their office No. 9 Mission street, and parties contemplating building will do well to inspect this material, as they will be convinced of its superiority for roofing purposes.

THE photo-engravings used in illustrating this number were made by the Globe Photo-Engraving Co., 419 Sacramento street. This is a new concern and is doing some excellent work.

Premises at Second & Folsom Streets.

JOHN M. CURTIS, ARCHITECT.

Furniture, Carpets and Upholstery.

The question how to furnish a house after it leaves the architect's or builder's hands is an all importrnt one. What kind of carpets are suitable for this room, and what color or pattern for that; what style of furniture for the parlor, bedroom, library, dining room. etc.; and the kind of draperies, decorations, etc., suitable for each separate room.

The furniture and carpets of to-day differ very materially from the kind in use here in our early history. Then the plain sanded or plain board floor was the only carpet, and the furniture of the very cheapest kind. With the advance of civilization and the rapid growth of this city in wealth and refinement came the demand for the luxuries of eastern cities, and we find to-day as elegantly furnished mansions, supplied by the merchant firms in our midst, as in any city in the country. It is no longer necessary to send to the eastern points for the latest designs in carpets, furniture or upholstery, for our own dealers in these lines carry as large and complete stocks of such goods as any similar houses in the east.

The styles in furniture change with every year, each era having some particular fancy, thus the designs are continuously changing from the heavy massive pieces of former years to the elaborately carved, and then again to the delicately fashioned style of a century or so ago.

The furniture of to-day is of a severe and austere pattern, differing entirely from the ornamental and elaborate designs formerly in vogue, making quite a radical change, and withal has an elegant, substantial and luxuriant appearance.

As in design so does the style in the woods change, and the most fashionable and latest to-day is furniture of oak or antique oak, although the rich mahogany cherry and walnut are still called for. So in carpets, window shades, draperies and other decorations, each season brings new changes and designs, and richer material requiring the ingenuity and experienced taste of the artist to decide which is the most suitable for the correct furnishing of the several rooms. In eastern cities the furnishing of a modern residence is given into the hands of some well-known furnisher, who has *carte blanche* to use his skill and artistic taste in the complete furnishing of the parlors, library, bedrooms, dining rooms, etc., with some passing suggestions from the owner, and invariably when complete the house is better furnished, everything harmonizing more than it the different furnishings and decorations were supplied by so many different firms.

Such a firm carrying a stock of goods to furnish a house complete is the well known firm of W. & J. Sloane & Co., 641 to 647 Market street. The structure occupied by them is one of our modern business buildings, equipped with every convenience and arranged so as to display their elegant stock to the best advantage.

Their stock of furniture in parlor, bedroom, library and dining-room sets is varied and handsome, every factory in the country being placed under requisition and their choicest productions chosen. The firm aims always to have the very latest and newest designs in the market, and are giving our residents here the most modern goods as soon as produced in eastern points. They also manufacture furniture to order and furnish original designs.

In carpets their stook is also most complete, embracing English and American Wiltons, Axminsters and other kinds of all grades, from the cheapest to the most expensive. W. & J. Sloane & Co. are sole agents for Alex. Smith & Son's Co. of Yonkers, N. Y., American Moquettes. These carpets for beauty of design and durability cannot be excelled by any fabric, and are superior to many imported articles of a similar kind. In window shades, curtains, tapestries and upholstery goods the house has a most elegant selection of every shade and design; all departments in charge of experienced artists. The firm have furnished many of our leading residences and hotels, among which are the following:

The Palace Hotel furnished by them when opened with carpets throughout, the Baldwin Hotel and Theatre, the new California Theatre, the Hotel Del Monte with carpets and upholstery, and all the carpets for the Hotel Rafael, and the Stanford house at Palo Alto.

The firm always aim to give their patrons the very best and latest things in the market, and have won an enviable reputation in their particular line.

The attention of the public is called to the fine exhibit of the firm at the Mechanics' fair, where three interiors of parlor, dining-room and chamber are shown.

Lumber and Building Materials.

The resources of the Pacific Coast in lumber are almost inexhaustible, for nearly all the varieties of wood grow throughout the different sections of the country, so that taken as a whole this quarter of the United States certainly is better supplied with lumber for the various uses than any other portion of the land. Lumber forms an important factor in the building interest, for no building is erected except that lumber enters into the construction in some form or other.

The lumber to be used in a building shou'd be, first of all, of good quality and well seasoned. Certainly no State in this country has finer qualities of lumber or a climate better adapted to the thorough seasoning of it than our own State of California.

Of the different kinds of lumber, redwood, of course, is more commonly used than any other. Our redwood forests are the wonder of the world, and millions of feet are annually cut for this and other markets. It certainly is the best building material of wood we have; and, besides its other numerous good qualities it burns slower than most any wood used in the construction of houses, necessarily making it a very valuable item in the erection of fronts of buildings, since its slowness to burn is the protection from fire.

It is also used for inside finish of buildings, admitting of ornamentation and polish for doors, panel work, wainscoting and other uses throughout the building.

Sugar pine on account of its scarcity in comparison with redwood—white pine, yellow pine, etc., is the highest price lumber for building material. It is stronger than redwood, has a fine grain, is free from pitch, and is used principally for doors, blinds, sash, etc.

The Curly and Burhl redwoods are two of the handsomest woods of our native forests, and are growing more and more popular, not only here but in Eastern and even foreign markets.

The curly redwood is obtained when milling, from the stump or first log in the tree, and runs from three to fifteen feet in diameter. It admits of high polish and has a very beautiful grain, curly as the name indicates, showing the tracery of fern leaves and heads of animals. This wood is being extensieely used for interior finish, for panels in doors, counter tops, table tops, and all kinds of bedroom and parlor furniture.

Burhl redwood comes in round or oval pieces, from two to three feet in diameter, and is also a valuable addition to our fancy woods.

A firm making a specialty of this kind of lumber is Starbird & Goldstone, located on the corner of Market and Spear streets. This company was established in 1872 and has been prominently identified with the lumber and building interests of our city ever since. They are wholesale and retail dealers in all kinds of lumber and building materials, making a specialty of sugar pine and also of Curly and Buhrhl redwood for Eastern shipment. Besides these they carry a full and complete stock of building material, such as lath, shingles, etc., and dry dunnage for ships.

They solicit the trade of the builders of this city and the coast, and ship largely to Eastern and foreign points.

They have supplied a large number of houses with their lumber and have lately shipped 75,000 feet to Liverpool and 50,000 feet to London of Curly redwood and Burhl, which are prized very highly there and are rapidly superceding other fancy woods. In this city these woods have been used quite frequently in some of our prominent residences, notably in W. T. Coleman's, corner of Fillmore and Pacific streets, for panneling in the halls and library.

Owners and contractors would do well to make a more liberal use of these handsome native woods in the finish of their own buildings than they have heretofore—thereby encouraging our home industries in this branch of industry as well as in others.

Hoop Clamps for Large Tanks.

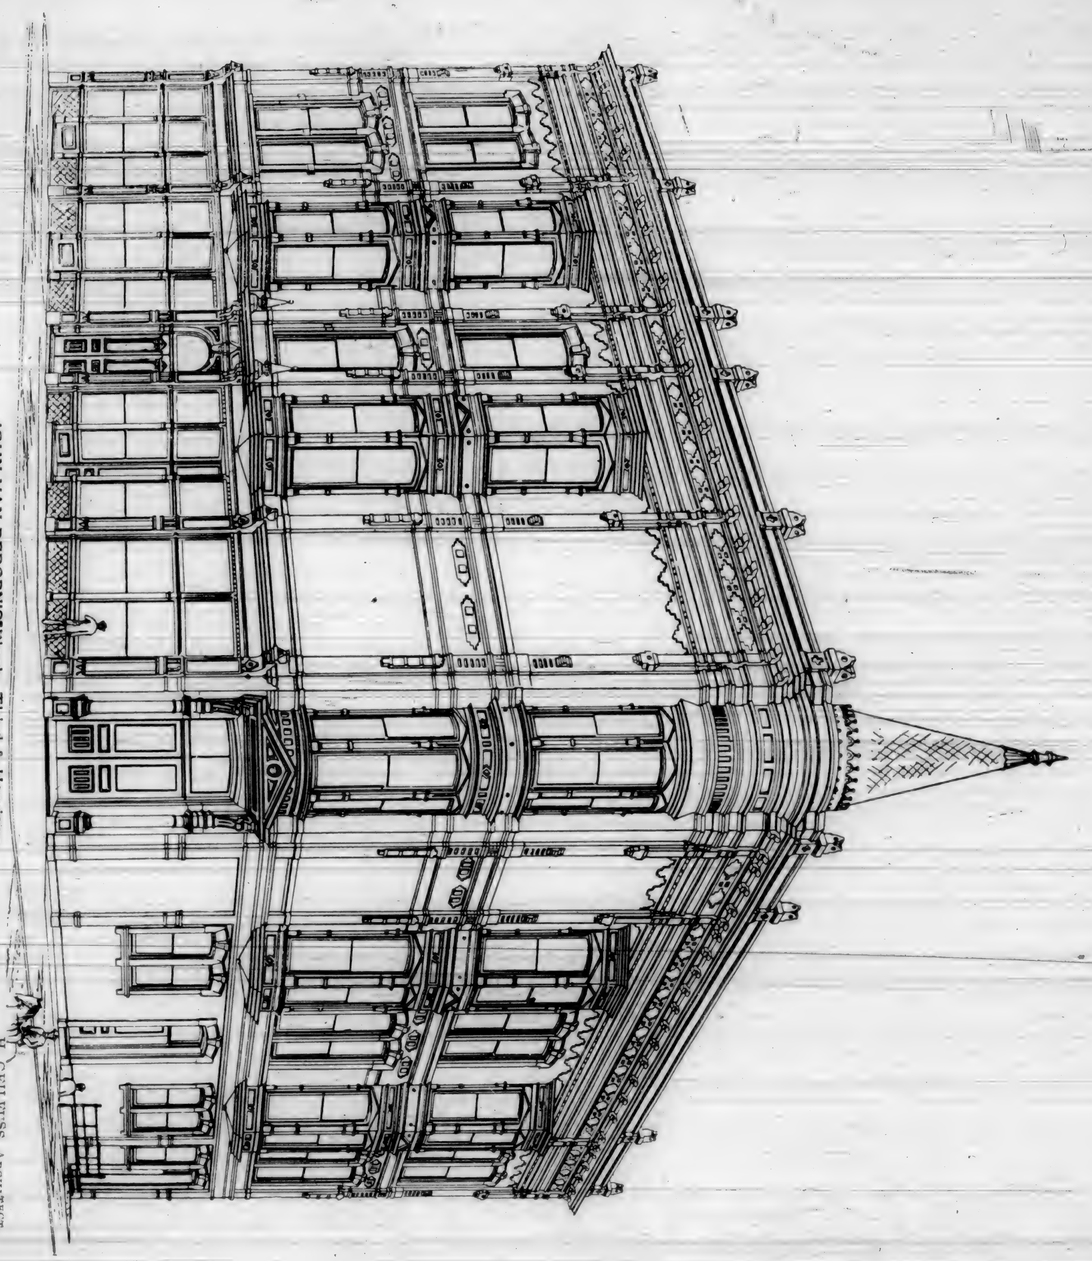
The invention of Mr. Asa R. Wells, which is illustrated in this number, supplies a great want, particularly in dry and hot climates; where shrinkage of lumber is considerable.

No devise heretofore in use for tightening hoops has been satisfactory, for the reason that the draft was not straight and therefore not direct on the hoops.

The advantage of a clamp hoop over a riveted hoop, particularly in heavy bands for large tank work, must be apparent to all.

To tighten a riveted hoop requires tools, scaffolding and capable men. It also mars the paint and injures the iron. To tighten with a clamp, working freely, requires simply a ladder and a wrench in the hands of anybody.

Mechanically considered, the device may be described as a right and left draw buckle, acting on ball and socket joints. It therefore works equally free, powerfully and effectually on long or short draft and on large or small circles. Practically considered, this device has proved a great success. By its use Wells, Russell & Co. have set up some tanks as large as 36 feet in diameter, which are perfectly water-tight.



JOHN VAN BERGEN'S Block—Third & Harrison.

H. GEILFUSS, ARCHITECT.

Window Glass.

One of the most important items which enters into the construction of a building is glass, both plain and ornamental, and consequently in the letting out of contracts builders should certainly see that the very best kind obtainable is to be used. Nothing adds so much to the appearance of a building as clear, transparent window glass, and tenants certainly appreciate rooms which have windows of clear and perfect glass. The facilities for obtaining the best glass manufactured, are as great in this city as in any city in the country, and there is therefore no excuse for not taking advantage of the opportunity offered and using first-class material, which is certainly the most economical in the end.

The establishment of Fr. H. Rosenbaum is one of the oldest and most reliable in the city in this branch of manufacture, having been established in 1862, being then located on Sacramento street near Front. In 1864 he removed to Battery street near Washington, but quarters being too small another removal was made in 1868 to his present location, 567 Market street.

The premises occupied consist of three floors 30x170 feet in dimensions, with an additional warehouse on Stevenson street in the rear 50x100 feet.

A large and complete stock is constantly carried, consisting of French, German and English plate glass, window glass, mirrors and looking glass plates, rough plates for sidewalks, corrugated glass for skylights, colored, enameled, cathedral and prismatic glass in all desired sizes.

On the second floor is located the factory, which some six months ago was enlarged and thoroughly equipped with the latest and most improved machinery for silvering, beveling, ornamental cutting, grinding, embossing and crystallizing glass.

Skilled mechanics are employed in all the various departments, and orders are filled promptly and on very short notice. Estimates are furnished on all contracts on parlor and bar room mirrors of all kinds.

Among the prominent buildings furnished by this house we mention the following, which give evidence of artistic and first-class workmanship:

The First National Bank building, with crystallized, beveled and ornamental glass; the Meyer residence, California and Gough streets; A. D. Moore's residence, Pacific avenue and Deviseadero street; J. A. Hooper's residence, Laguna and Washington streets; the Mareschal Neil House, corner Ellis and Jones streets; the Collins residence, corner Alice and Durant, Oakland; A. D. French's residence, East Oakland, Mr. Hanson's residence, Redwood City; M. Rosenbaum's building, now in course of construction, corner of California and Front; the Bancroft History building, Market street, McDonough Block in Oakland: Capt. Niebaum's villa in Inglewood, Napa county, and many others.

Mirrors from this establishment adorn the walls of some of our most pallatial homes, and massive plate glass windows which add so much to attractiveness of stores owe their introduction in a great measure to the enterprise of this pushing firm.

Wire and Iron Fencing and Ornamental Work.

Wire and iron are rapidly superceding wood in most cases where used for ornamental purposes, such as fencing, railing, roof cresting, etc. The uses wire and iron can be put to are innumerable, and from being the more durable admits of more ornamentation than wood for the purposes used. Wire and iron are used for fencing, for houses, stair railing, divisions, floor rails, desk and counter railings, panels of elevators, elevator guards, skylight guards, for protection against fire and breakage of glass, for the covering of basement windows, gallery fencing, stores and other numerous uses.

Wire fencing, and more especially iron fencing, is rapidly taking the place of the old wooden fencing formerly used, and is a vast improvement. It is highly ornamental and durable, being almost indestructable and the more economical.

In iron fencing there are constantly new designs being manufactured, the variety being without limit, as the wire can be twisted by the new machinery now in use into any shape or design imaginable

The wire works of D. D. Wass, 141 and 143 First street, are the largest in this line on the coast and were established in 1884. The works have been enlarged to accommodate Mr. Wass' increased business and are thoroughly equipped with all modern appliances and machinery for the manufacture of his various specialties and products, besides constantly supplied with new machinery as the occasion demands. He gives employment to a large force of hands and is prepared to manufacture on short notice all kinds of wrought iron and wire fencing, roof crestings and finials, wire window guards, gates, skylight guard work, desk, counter, bank and office railing, ornamental brass work, gas-pipe rail, show window fixtures, coal and sand screens, founders' riddles, spark guards and fenders, and also light ornamental wrought iron work.

He also makes a specialty of all kinds of artistic brass and nickel-plated work in the shape of gates and wickets. Mr. Wass has filled a large number of contracts and furnished the wire and ornamental iron work on a great number of buildings in this city and in various parts of the State. He has just finished all the wire work on the new cruiser "Charleston," consisting of some 300 mess and clothes lockers, wired the same vessel for an electric bell system, furnished the wire work for the bank of Hanford, Cal., consisting of counter railings, wickets, partition work, doors, etc., also the elevator work in the Walters' building, Sullivan estate building on Bush street, Huntington & Hopkins building, Golden Rule Bazaar, and has the contract for furnishing the new Asylum building at Agnews with wire window guards, besides other numerous and extensive contracts.

Parties desiring work of this nature will do well to call upon D. D. Wass and examine the class of work turned out in his establishment.

Hot Water Heating.

The old idea that we need no artificial heat in our houses in California has long since been exploded, and it is no longer a question of *shall we heat*, but now shall we heat our houses. The open grate or fireplace, the store and hot air furnace systems have long been used on this coast. Laterly the steam and hot water systems have been conspicuously brought forward and are becoming more popular and general in their use. For private residences the hot water is the best, giving a mild equiable temperature superior to the stove hot air furnace or the steam systems; and where it has been properly constructed, for comfort, economy and healthfulness, it has no equal. Two things are requisite herein to its success:

First—The apparatus must be adapted to the wants of this coast, and herein the fuel, the water and climate must be considered.

Second—The system requires more care, judgment and skill in its construction to ensure success than either of the other systems, for unless the circulation be perfect and the distribution well balanced the system will be faulty and undesirable, the heat slow and unequally distributed, and the consumption of fuel unnecessarily increased.

This skill and judgment is obtained only by experience. The principle of the hot water circulation is entirely unlike that of steam. Neither the steam fitter, the plumber, nor the hot air furnace men have any practical experience adapting them for this work. *It is a trade by itself*, and the plumber or hot air furnace agent who contracts to put up a hot water apparatus generally experiments at the expense of the owner of the building.

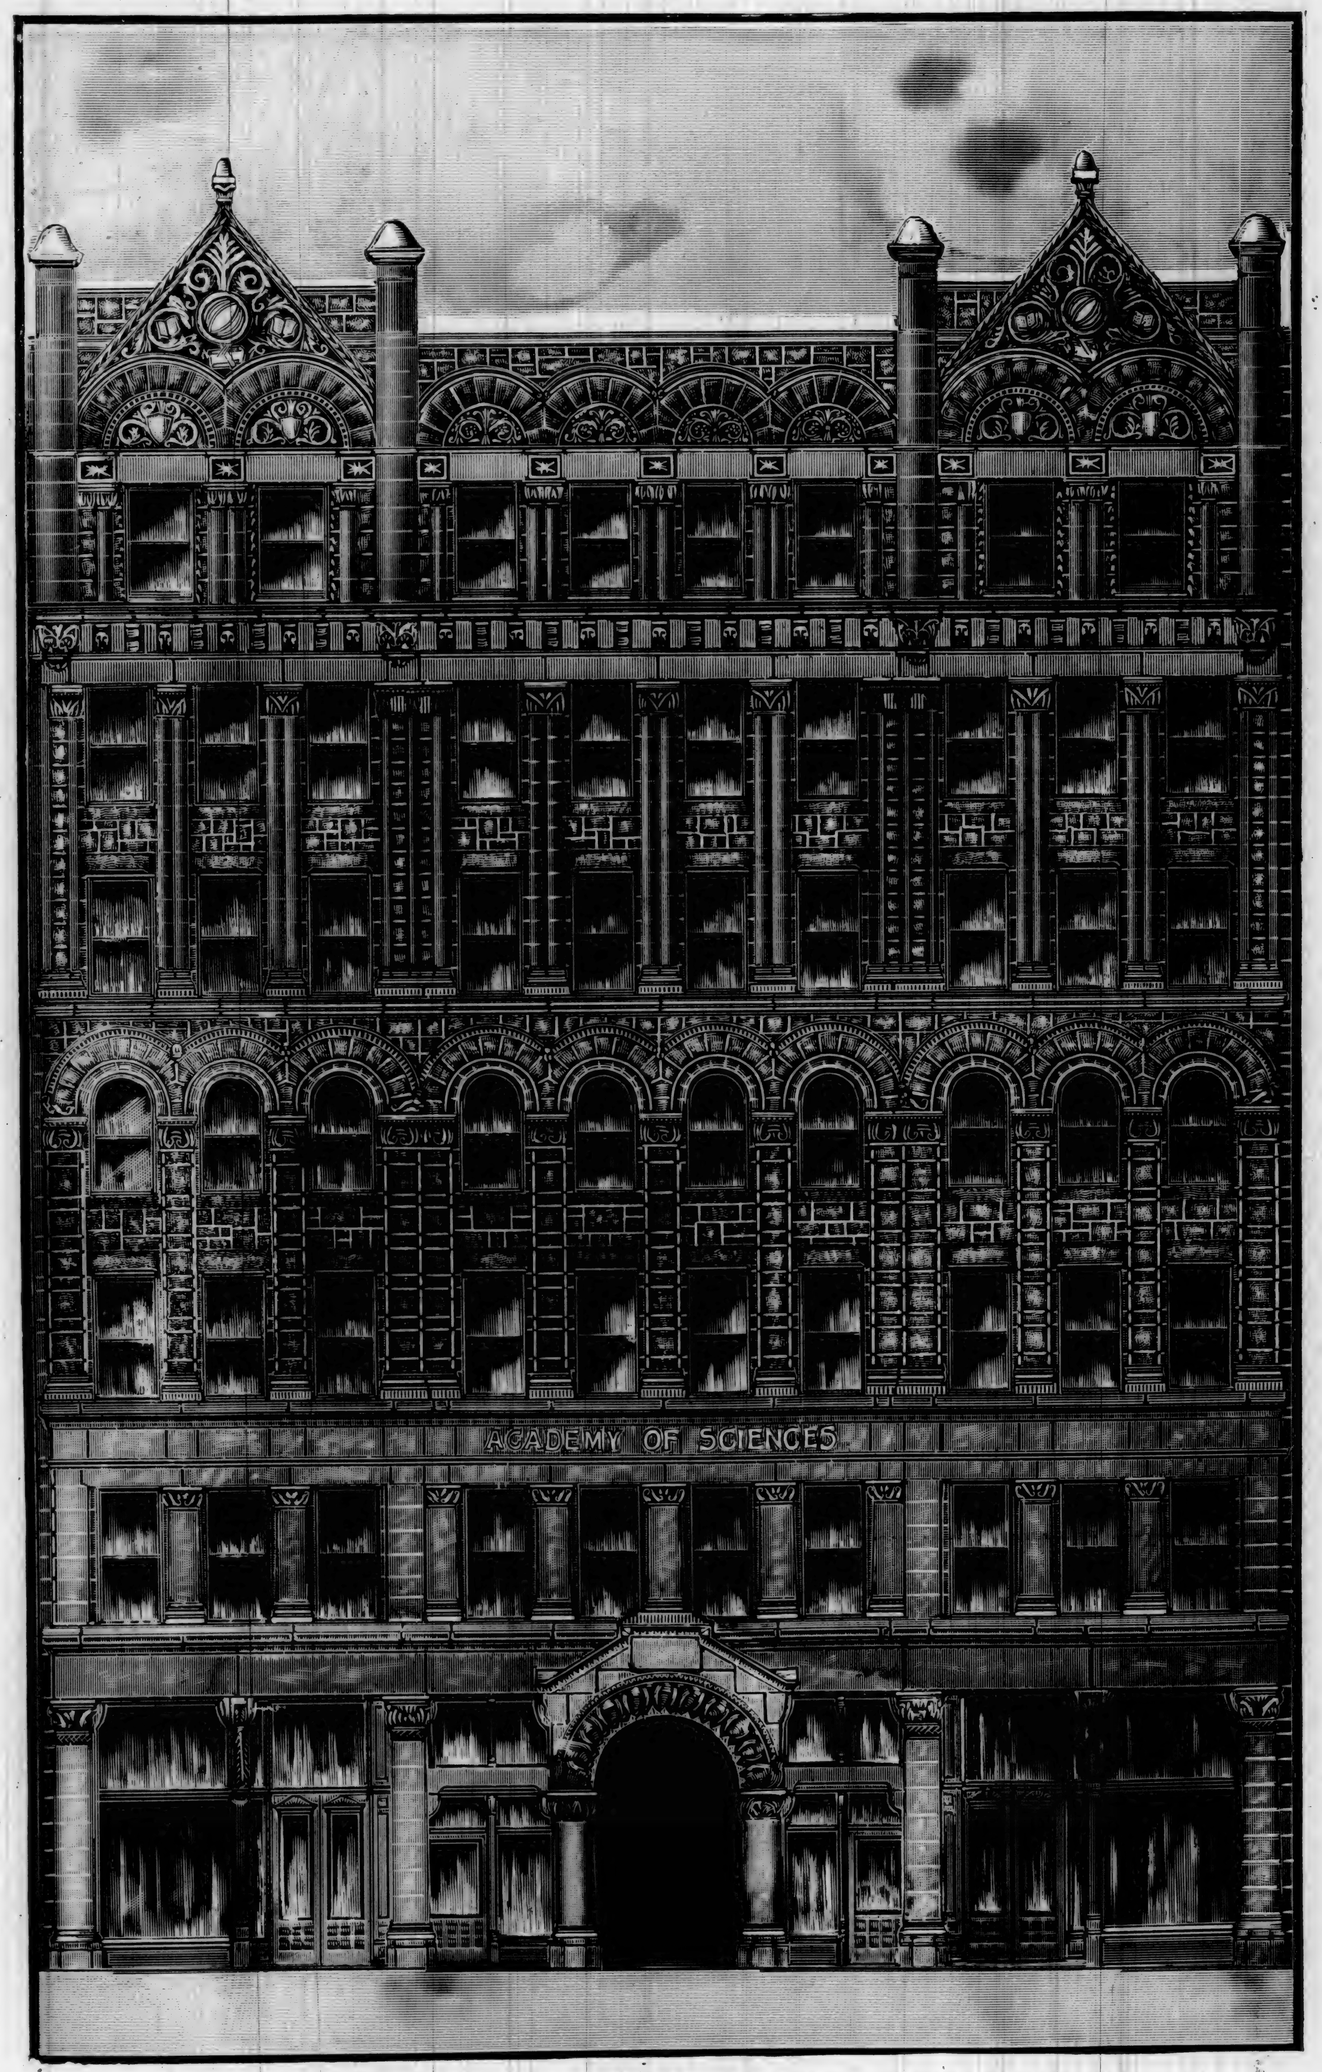
The hot water system was introduced on this coast eleven years ago by C. D. Harvey, who brought from the eastern states the latest and most desirable appliances then in use for the hot water warming of houses.

It soon became apparent that the different climate of the Pacific coast, the different fuel and the different surroundings required a different form from those used in the eastern states, where continuous and strong fires are maintained from early fall until late spring.

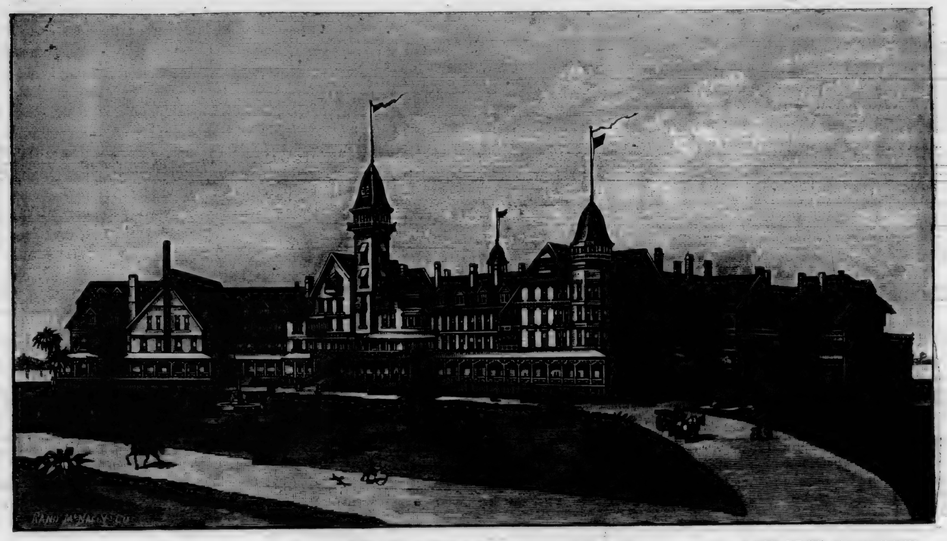
The hard coal burners were illy adapted to the soft bituminous coal used here, and the impure water of San Francisco and Oakland required a different construction of heater. Eleven years of practical labor and observation in this work has enabled the industrious inventor to detect and obviate many of the objectionable features of the eastern apparatus for our California trade, and in the face of strong competition to establish another local industry on our coast.

The reputation of the *Harvey hot water heater* was no sooner established than the eastern houses flooded the market with their same discarded goods, operating through local agents who have recently, and with little or no experience in this system except such as has been acquired in the general plumbing trade, become the advocates of the hot water system.

The first heater introduced by Mr. Harvey was formed by a series of flat cast iron plates, or water chambers, placed horizontally over the fire-box in stacks, around and through which the fire passed in its course to the chimney.



THE NEW BUILDING FOR THE CALIFORNIA ACADEMY OF SCIENCES, SAN FRANCISCO, CAL.
PERCY & HAMILTON, ARCHITECTS.



Hotel Del Coronado, Coronado Beach. REID BROS. ARCHITECTS.

This was economical in fuel, quick to heat and satisfactory for the first few months. Soon however the *sediment* from the water was deposited within these sections, making the fire less effective and the deposit increasing. The lower section nearest the fire cracked or burned out after three or four years' service, so their removal became a necessity.

Next the form of the casting from a flat to a curved surface was adopted, using return flues and providing for the deposit of sediment below the direct fire surface.

This form lasted longer, but the same results followed though less frequent. It was therefore apparent that the cast iron surfaces could not be relied upon, where the heating and cooling of the surfaces followed in such frequent succession as in our climate. The iron becoming crystalized was bound sooner or later to crack.

Next the tubular heater, constructed of two-inch wrought iron pipe, containing a smaller pipe inside to secure a circulation, was used. By this heater the tendency to crack was obviated, but the deposit of sediment and the increased friction retarding the circulation between the two pipes, after a short trial, stamped this as only a partial success.

Three years of experience and study have demonstrated that the successful hot water heater for the Pacific Coast must be accessable in all its parts, within the water chambers as well as upon the few surfaces outside. The removal of the sediment inside the heater is quite as important as the cleaning of the soot from the outside surface. While both are non-conductors of heat and cause a needless waste of fuel, the sediment will cause the cast iron to crack and the wrought iron to burn out and will also retard the circulation by causing unnecessary friction within the pipes and chambers.

All the different forms of heater above described, or heaters constructed upon similar plans, are extensively advertised on this coast by Eastern houses through local agents with no practical experience with these goods.

The flat cast iron sections or stacks over the fire-box, as well as the telescoped pipe heaters in their various forms, will all repeat the same results over again and the purchasers will pay for the experiment while the agents, unconcerned and unconscious of the inevitable result, continues to advocate, advertise and sell the same.

"Where ignorance is bliss 'tis folly to be wise," especially if the purchaser pays the price and the agent pockets the profit.

The hot water system is undoubtedly superior to any other if properly constructed, and no greater mistake can be made than to suppose that a plumber or other pipe fitter can satisfactorily plan and construct this work, relying upon Eastern appliances and Eastern plans where practical experience is lacking.

Mr. Harvey has invented and manufactures a wrought iron tubular heater so constructed that every part inside and outside can be reached and cleaned, and any tube can be removed and replaced with a new one without disconnecting the heater or disturbing the brick work or sending to the factory for a duplicate section in case of a crack or defect, as would be necessary with an Eastern heater. Mr. Harvey has also the exclusive agency for the celebrated Bundy Hot Water and Steam Radiator, including the New Elite, which he uses in his local business or furnishes to the trade. This radiator is used more extensively than any other, over 11,000,000 square feet now being in use, and are made in a greater variety of forms than any other manufactured.

Mr. Harvey is doing exclusively a hot water and steam heater business, using the best material, the latest devises and doing only first class work which his eleven years experience will corroborate. His connection with the Griffling Iron Co., the largest manufacturing firm of hot water and steam heating radiators in the United States, ensuring him the latest, best and most improved appliances from the East in connection with his own inventions here.

Elevators.

The building of elevators has shown as much progress and improvement as any other of the conveniences of the modern building of to day, and a building without a first-class elevator is as much a novelty as one in former years was with one. The old rope hand hoist first in use, gave way to the friction clutch hand hoist, which is still in use in some buildings for freight purposes, but is being replaced by the more modern elevators now being almost universally erected in all first-class buildings.

In passenger elevators, the old style horizontal cylinder hoist has many disadvantages and is a very dangerous machine. It has a large and small drum and a coil continually revolving around two small drums, causing it to crack and break, and of a necessity the cage must fall, depending entirely upon what precaution is taken to prevent or stop its rapid descent.

Another disadvantage in these elevators has been to use only one main rope for the cage and two or more drum ropes. This machine, which is called a pull machine, is so constructed that the water enters on the rod side of the piston, which makes it very dangerous, for should the piston rod corrode from the action of the water, or become fractured by use, which often happens, the cage drops and endangers life and limb. There can be no question, that as compared with other large cities in this country, we are behind the times in making compulsory provisions for the safety of our citizens, and steps should be taken to compel the use of the best and most improved appliances in elevators that insure absolute safety to our citizens.

Undoubtedly the safest protection against accident is the Safety Air Cushion and Air Brake attachment supplied by the Ellithorpe Air Brake Company, of which the firm of Wm. H. Birch & Co., 119 Beale street, of this city, are the sole agents and manufacturers on this coast.

This air cushion, which can be built in in any elevator now in use, is simplicity itself; there is absolutely nothing to get out of order or to cause death or accident through inattention or neglect; there are no springs to rust or wheels to oil or other contrivance to manipulate. The cushion has been tested all over he country, both intentionally and unintentionally, and never when the cab has been started, even from the top of the highest buildings, has an egg been broken, a glass of water spilled or the smallest damage happened. This air cushion is not a contrivance to stop the cab in transit. If the cable breaks or the cab starts on its fearful fall, it is allowed to go, but as it approaches the bottom it is gradually and safely brought to a halt by a scientific application of air caused by its own velocity, and this without jar or commotion of any kind.

The two safety devices known as the Ellithorpe Air Brake and the Ellithorpe Air Cushion have stood the tests of hundreds of the most severe and practical trials, and in no single instance have they failed to operate successfully. The air brake is simple and easily applied. It operates upon a different principle from the air cushion. The air brake while operated by means of compressed air prevents the cab from falling more than a few feet, stopping it gradually without the slightest concussion, the effect produced being precisely the same as applying the Westinghouse brake to a train of cars while under a high rate of speed.

There can no longer be any excuse for loss of life from the falling of elevator cabs, for it has been fully and practically demonstrated that either the air cushion or air brake will effectually remedy this great danger.

Wm. H. Birch & Co., 119 Beale street, the agents for this important invention, have placed them in the following buildings: The Pacific Union Club, the Hillsdale house on Sixth and Jessie, two in the Rosenthal building on Market street, the Marechal Neil house corner Ellis and Jones, First National Bank building, New City Hall, this city, and the Fresno Savings and Loan Society building, Fresno, all of which have been placed since November last and successfully dropped. The latest trial was in the Pleasanton Hotel where the apparatus was tested in the presence of all the guests, the cage having been dropped ninety-four feet; and also the New City Hall elevator in the presence of the mayor of the city and other officials.

Patent Chimneys.

The kind of chimneys to be used, in the construction of a building, is and should be an important item with the architect, contractor or owner of the building to be erected for upon it depends to a great extent the security of the building from fire and withal the comfort of the tenant.

Great improvements have been made in the building of chimneys. The old style brick ones which were brought up from the basement to the roof have been supplanted by the introduction of the patent modern ones which are now used almost exclusively in all modern buildings.

J. Browell, No. 727 Montgomery street, is the owner and patentee of Browell's Patent Chimneys, which have been endorsed by the Board of Supervisors and approved and recommended by the Fire Wardens, Insurance Companies and leading architects throughout the state generally.

This chimney is constructed on the inside of terra cotta of the very finest fire clay, and has an outside lining of galvanized iron with an air space from the bottom to the top above the roof, while most other patent chimneys are perforated with holes, thereby sending all the hot air though the building, having no escape above the roof, thus making them a veritable hot air bed and consequently very dangerons.

In former years the pipe manufactured was of inferior quality, but now through years of experiments and experience, this inferiority has been overcome. The pipe used by Mr. Browell in the construction of his patent chimney is made of the very best terra cotta and is perfect in every respect, both as regards to safety from fire and to strength and lightness.

His chimney can be placed in any part of the house or attached to the outside of any building, being fastened to the building by means of iron rods or straps making them perfectly straight. The bands which are put around the meeting ends of the sections of pipe are carefully filled with cement on other fireproof substances, thereby making the chimney absolutely safe and there has never been an instance of fire through means of defective flues where his chimneys have been in use. These chimneys are also constructed in such a manner, that they can be readily used as heaters and ventilators and are unquestionably superior to anything of the kind invented in the United States. They are the only chimneys in which bands and fillings can be used to make a smoke and air tight joint, and in which iron rods or straps can be used for fastening the chimney to a building, all others being infringments.

Mr. Browell is the patentee of five patents covering every improvement that can be made and the chimneys he is now using upon the various buildings in this city and vicinity are as near perfect as can be made. They can be shipped to any part of the country and put into position by any mechanic. Owners of builders should see to it that in specificatlons of their buildings, Browell's chimneys are specified and used,

In many instances where the Browell chimney is called for in the specifications, a cheaper and inferior chimney is often substituted and architects or owners should investigate more closely into such matters and see that the Browell chimneys are used in every instance. It would also be to the interest of the insurance companies to pay some attention to the kind of chimneys used on buildings upon which risks are taken.

While probably more expensive than other chimneys they are much cheaper in the end and save considerable future repairs and trouble.

These chimneys are in use upon the principal buildings of this city and vicinity, prominent among which are the residences of M. Hopkins, Senator Stanford, W. H. Crocker, the London and Paris Bank building, the Harbor Commissioners offices on the wharves, and are now being used upon the building erected by Henry Matthews, on Ellis, between Paul and Mason streets.

Artificial Stone Pavements.

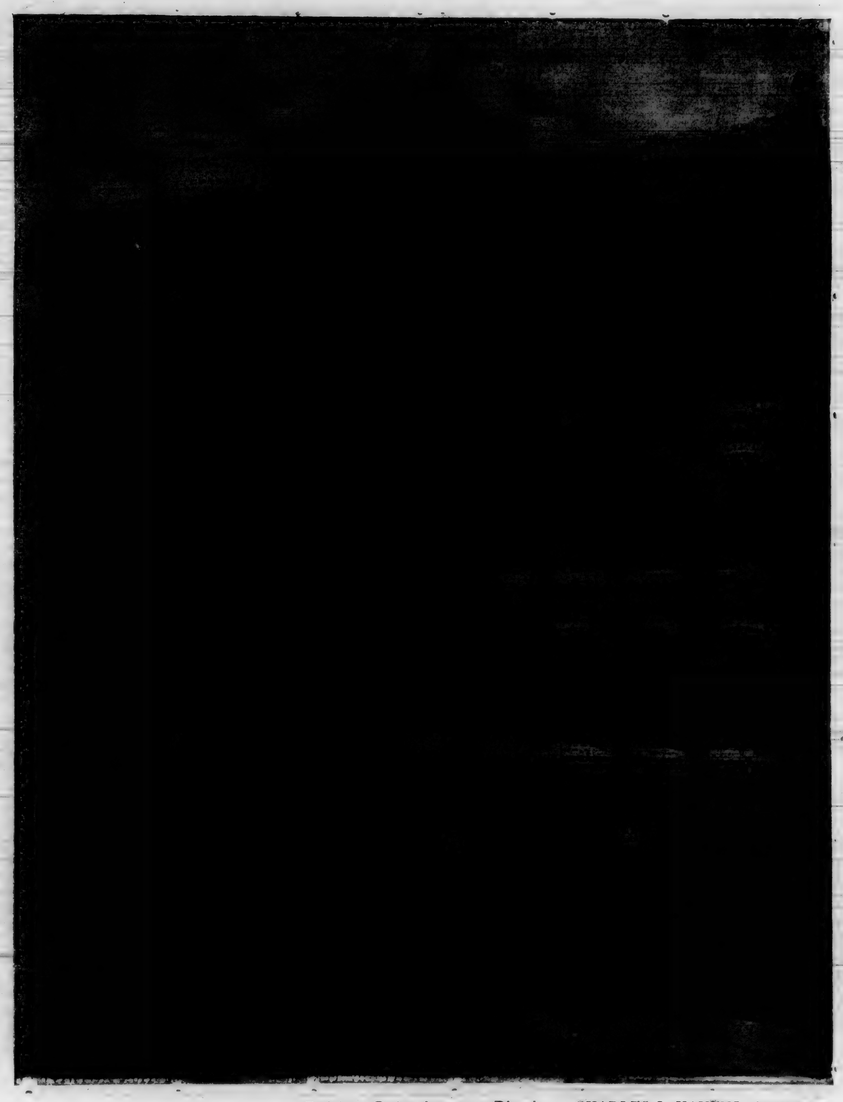
In keeping with the general advance and progress of architecture has been the improvements of our streets and sidewalks.

From the time of uneven, unsightly decaying planks, with projecting nails, to the era of brick pavements covered with soft composition of almost as uneven and unsightly appearance as the former, to the handsome, hard and durable artificial stone pavements of the present day, our city has shown a gradual and steady advance.

A handsome modern sidewalk in front of a structure is as necessary to its general appearance as its interior finish, and owners of buildings, in order to add to the value of the same, can no more neglect this important feature than any other which goes towards adding to the comfort of its tenants.

No material for sidewalks is equal to first-class, well laid artificial stone. It is smooth, clean, hard and durable and the cheapest and most economical in the end, for when laid by honest and experienced contractors it will last a lifetime.

Low prices mean the use of poor materials, not only in pavements, but in everything else.



Golden Gate Avenue Block. CHARLES I. HAVENS, ARCHITECT.

When the Schillenger patent expired several years ago numerous parties rushed in with little or no knowledge of the business and took contracts to lay artificial stone pavements at almost any price they could get, and the natural consequence was that numerous property owners jumped at the chance of saving a few dollars and accepted their bids. The result is that these sidewalks are crumbling to pieces, many of which have been laid less than a year, while those laid by first class firms have stood the test of over ten years, the walks being as good as when first laid.

If property owners would consider that there is at the utmost but $20 difference between a first class job and a ten cent sidewalk, one lasting an ordinary lifetime and the other but a few years, surely there should be no hesitancy in choosing the better. It is wise to learn from others' mistakes, and the teachings from this experience is that a first class artificial stone sidewalk is undoubtedly the best and cheapest in the end, and the employment of only skilled and responsible contractors, whose work has shown its merit, should be given the contracts for laying the same. Let owners give the laying of sidewalks to responsible parties only and they will never regret the difference in cost.

Among the first class concerns engaged in this interest is the Gray Bros.' Artificial Stone Paving Co., established in 1881 and incorporated in 1889, with offices at 316 Montgromery street, this city, and branch offices at No. 1 South Fort street, Los Angeles, and 1506 Park street, Alameda. They have laid some of the best and handsomest sidewalks in the city and besides take contracts for concrete foundation work of all descriptions. They use none but the very best material, employing none but skilled and experienced workmen, of whom they have upwards of 150.

They import the very best cement direct from England and Germany and own their own vessels which transports the immense amounts of gravel used from the various beaches. All of their work is guaranteed for ten years and they do nothing but first class, honest and durable work. Among the numerous pavements laid by them are the walks of the Grand Hotel, those corner of California and Kearney streets, Bush and Montgomery, five blocks on Van Ness avenue, between Golden Gate avenue and Vallejo, the Nightengale Block on Haight street, around the residences of P. B. Coggswell, A. D. Moore, F. A. French, and numerous others in this city. Among their large contracts was $187,000 worth of work in Santa Monica, Colton and Riverside and five miles of walks in Alameda and San Rafael.

A BUILDING has just been completed in Columbus, Ohio, in which a novel and beautiful feature in architecture has been introduced. The front of the building has a medallion formed of pressed brick, the face chipped off, giving a surface that resembles rough-faced red sandstone. The brick, while equal in appearance to stone, will retain its beauty longer, as stone grows darker with time. Many architects and builders who have visited the building, express great admiration of the effect.

Pressed Brick and Terra Cotta.

While building has progressed rapidly on this coast during the last twenty years, it has been with an eye more to the immediate than future service.

The necessity of providing for a rapidly increasing population too often results in the construction of the cheapest structures possible, with an appearance of solidity which is merely a veneer of zinz and paint. But with an increase of wealth and in emulation of older cities, the more thoughtful and the really more economical of our people are impressed with the more enduring qualities of architectural construction. The architecture of a city usually corresponds with the character of its inhabitants.

There must necessarily be progression or decay and there is as much progression in the art of making bricks and terra cotta and in the style of them for building purposes as in anything else in the building interest.

The sun-dried adobes have given way to the common burned brick and they still are the cheapest and most durable of building material.

But the finish of the common brick is not as acceptible to the artistic sense as it might be and to cover its defects this city has covered the fronts of its buildings with mud in the vain attempt to make them resemble stone.

There has been some good excuse for this as the fine finished brick, such as Philadelphia, Baltimore and St. Louis produces have been too expensive to use on account of high freights, etc., and the material produced on this coast, heretofore, has been of a much inferior grade.

Matters are changing here now, new manufactories are in operations and builders need no longer send east for their fine pressed brick and terra cotta as these articles can now be obtained in better quality and at much cheaper rates at their doors.

The Union Pressed Brick & Terra Cotta Co., have just completed large and extensive works at Vallejo, with their general offices located in the Flood Building, room 31, in this city, and are turning out some of the finest work ever produced in America.

This material must be seen to be appreciated as nothing approaching it has been used in this city. The brick is being used in the Concordia Club building and is called for in the specifications of other buildings in the course of construction.

The machinery adopted by this company is of the latest improved patterns, which facilitates the making of brick and terra cotta of the finest quality at the lowest cost. The material used in the manufacture is free from alkali in any form and produces an article, which for color, uniformity of size, texture and strength is not excelled, if indeed equalled, in the world. The brick is of a deep rich, red color, with smooth, almost polished surface, firmer than granite, so homogeneous that it is easily cut, and so hard that it withstands a pressure of 16,000 pounds to the square inch. The terra cotta is of the same shade as the brick, and when struck with a hammer rings like steel. The modeling, which is done by one of the foremost artists in America, is beautiful in design and magnificent in execution. The excellence of the production of this company will be their chief advertisement, and the buiders of this coast are to be congratulated upon being able to procure such beautiful and durable material.

Fire Protection.

Protection against fire is and should be the first consideration of every owner and tenant of a building, and every precaution should be taken to use such contrivances as will extinguish fire in its incipiency with the least damage to building or stock.

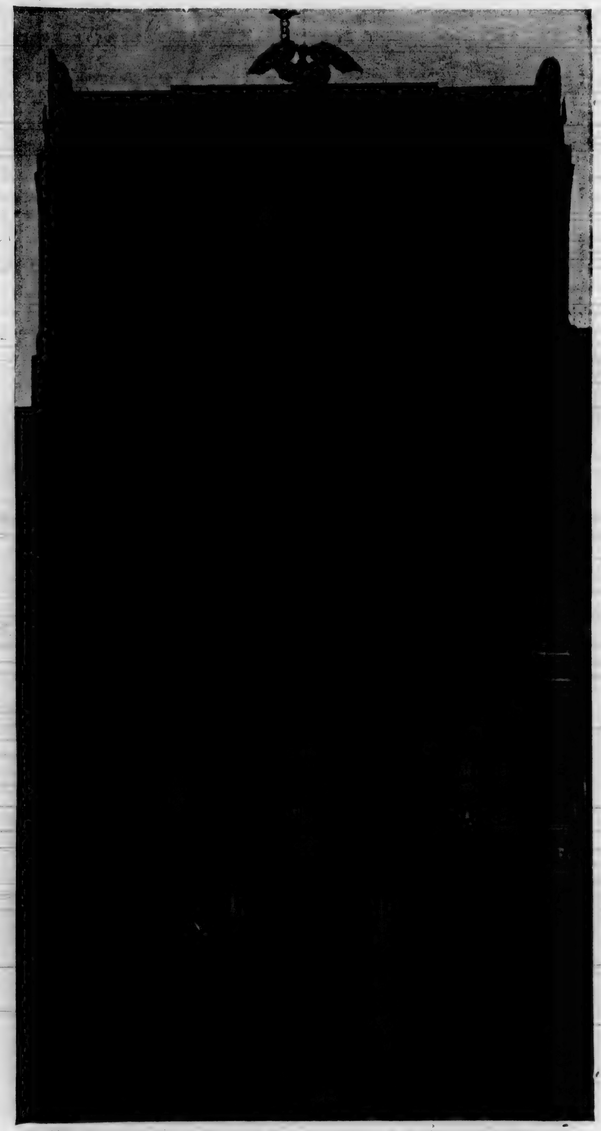
A piece of fire apparatus should be perfect in all its parts and if any part be defective the whole is defective. It should be simple in construction without any parts to get out of order and be ready for use at a seconds' notice. Such an apparatus meeting all these requirements is the "Paragon Hose Reel," of which W. T. Y. Schenck, 222 and 224 Market St., is the inventor and manufacturer.

This reel is designed for use in warehouses, public buildings, mills, manufactories, hotels, etc., and especially in buildings where there are times when only a watchman or a few persons are about. Quick and sure work is an absolute and fully recognized necessity for all inside fire protection; and by actual and repeated experiments by green hands, with this reel and hose, water has been turned on, 100 feet of hose pulled off, and a stream of water put on a fire in thirty seconds. It is permanently fastened to the wall, out of the way, supported by suitable brackets, and connected directly with the supply pipe through a hollow journal and packed joint, which allows the water to pass freely into the hose being connected to the hollow journal inside the reel and reeled up.

Upon the discovery of a fire the party present quickly turns on the water by the valve attached to the reel, takes the hose pipe and runs off towards the fire, the hose running off the reel freely, without a twist or kink, and the water following immediately, thus saving the very valuable time usually lost in straightening out the kinks and twists in the hose and in going back and turning the water on. This reel and hose are acknowledged by the Insurance Union to be the most perfect inside fire protection it is possible to procure and they so take them into consideration in fixing insurance rates.

The Paragon Hose reel is equipped with the Eureka Mill cotton hose, which does not deteriorate with age, does not break in the kinks, does not burst and is *always* reliable. It does not burn or melt when in close proximity to a flame or heat, nor break up in extreme cold weather as does rubber hose, but stands an immense pressure and any climate.

It is also fitted with the "Ne-Plus" full water couplings, which give full water way, are easily opened and do not leak. The value of this coupling will be seen when we remember that the ordinary coupling goes only two thirds of the capacity of the hose so that the hose used is equal, almost to a size larger hose than as ordinarily fitted. The Paragon Hose Reel has proved efficient in many instances and saved hundreds of thousands of dollars in many buildings where in use. A partial list of buildings, hotels, mills, factories, residences, warehouses, etc., where this most efficient apparatus is in use is appended: Firemen's Fund Insurance Co., Union Iron Works, Risdon Iron & Locomotive Works, H. S. Crocker & Co., American Biscuit Co., Schmidt Label & Lithographing Co., Rix & Firth, Phoenix Iron Works, Wells, Fargo Building, Market St. Cable R. R. Co., California Electric Light Co., S. P.



Rosenthal Building, Market St. SALFIELD & KOHLBERG. ARCHITECTS.

Co's General Offices, S. P. Co's Passenger Depot and Freight Sheds, The Oriel, The Pleasanton, California Theatre, San Francisco Laundry, 85, in the Hotel Coronado, Los Angeles in Bryson & Bonebrake block, Los Angeles Theatre, Kerckhoff, Cuzner M. & L. Co., at Fresno, Hughes Hotel and Fresno National Banks, 14 in the State Insane Asylum at Stockton, 44 at the Hotel Del Monte, Monterey, 12 at the Hotel El Carmelo, Pacific Grove, in the State Capitol Building at Sacramento, at the Soldiers' Home, Santa Monica, besides numerous buildings in Nevada, Washington, Arizona, Idaho, British Columbia, Alaska, Hawaiian Islands and Central America, where they have done good service and received high testimonials.

Hardwood Lumber.

The interior finish of buildings is to-day one of the first features considered by those who contemplate building first-class modern office buildings or houses for themselves. There are many things to consider in interior decorations and finish of buildings.

In office buildings, banks, theaters, hotels and other public buildings it is certainly to the interest of owners to use such finish as will attract the attention of tenants or visitors, thereby enhancing the value from various standpoints.

In residences it is highly important that the surroundings should be pleasing, which cannot be realized unless there is harmony in those things which the eye must see—and the decorations and interior finish should be suitable for the respective rooms.

Nothing admits of a handsomer finish in buildings than the use of hardwoods, be they either mahogany, oak, ash, black walnut, cherry or maple, according to the taste of the owner, each of which admit of a high finish or elaborate carving. Besides the fine finish and elegant appearance the use of hardwood lends to the interior decoration of a building, is the solidity of appearance, elegance and durability that make it the most economical and cheapest in the end.

Formerly hardwoods were used only for furniture, fixtures, etc., but of later years it is entering largely into the interior finish of our best buildings and residences and is rapidly gaining favor and should be more universally and generally used for this purpose. Among the prominent firms identified with this interest is that of John Wigmore & Son, whose yards are located at 129 to 147 Spear street and 26 to 28 Howard street, with a branch establishment at Los Angeles.

They are wholesale and retail dealers in hardwood lumber and timber, Mahogany, Black Walnut, Quartered Oak, Plain Oaks, both red and white, Ash, Cherry, Spanish Cedar, Maple, Whitewood, Prima Vera; newel posts, balusters and rail stocks and all kinds of plain and fancy veneers and fancy woods.

Among buildings recently erected for which they have furnished hardwood lumber are the following: Mrs. Porter Ashe's residence on Van Ness avenue; W. H. Crocker's residence, A. D. Moore's, the Flood mansion, The California Theatre vestibule, the New *Chronicle* building, and many others of the principal residences and business blocks in this city and vicicinity.

Messrs. Wigmore keep in stock both at their yards in this city and at their branch in Los Angeles a full and complete stock of hardwoods and are prepard to furnish any quantity desired to builders or the trade.

Cooking Ranges.

An important adjunct and convenience to the modern residence and an important feature in the equipment of a hotel or restaurant is a first-class and reliable cooking range.

As great an improvement and ingenuity in this particular industry has been shown by manufacturers as in any other of the interests identified with buildings of the present age.

The French range of former years was more of an experiment and to-day has reached a degree of perfection equalled by few of ourmodern conveniences and is vastly superior to the old style range and common cooking stove. No really first-class residence, restaurant or hotel is complete without a range, and owners of buildings, or architects should specify the construction of a range in connection with the other conveniences of the building to be erected.

The superiority of a range over a stove is its cleanliness, firstly in regard to cooking utensils and secondly in the saving of labor in polishing the range, it being built entirely of brick, the top being the only part to be polished.

The John G. Ils & Co., French cooking range, now on the market and manufactured by them exclusively, is the very latest and most improved range and is the result of their experience of over thirty years in this particular branch of business.

Their range is built on a brick foundation on the floor of the kitchen or cuisine, the iron front frame and oven being filled and built in with the brick work, which is built around it forming the flues, the top of the range is then placed upon the frame, the entire range con plete, forming a stationary fixture. The castings of their ranges are made of a superior iron imported for their especial purpose and cast in their own foundry uuder the personal supervision of Mr. John G. Ils. Their ranges are erected with the greatest of care in order to insure the greatest wear and tear, and obviate the necessity of numerous repairs so prevalent with most ranges and stoves.

Besides the conveniences of these ranges for baking and cooking is the saving of fuel, for being set and built in brick, the fire once started, the heat is retained for hours.

These ranges are so constructed that the hot water back for the heating of water can be arranged so as to heat any amount desired for the largest dwelling, and they also retain the heat longer than the ordinary range. They are built in various sizes to suit, from 3½ foot one oven range to a 13 foot four oven range, operated by one fire place.

In eastern cities the range is always specified in the building of houses and builders and owners of buildings should see that their ranges are properly constructed.

The firm of John G. Ils & Co., was originally established in 1850 by John G. Ills, and conducted by him until March 1889, when upon his death he was succeeded by his son, the present proprietor.

The warerooms and factory, 814 and 816 Kearny street, have recently been enlarged to meet the requirements of their rapidly increasing business to almost double their former size, where a full and complete stock of all the necessary parts for all kinds of of brick set furnaces and bake ovens is carried, besides stoves, tinware and kitchen outfits.

They are also proprietors of the Jackson Foundry located in the rear of their warerooms, where they make fine castings of all kinds.

Among the numerous hotels, restaurants and residences supplied with the John G. Ils & Co., French cooking ranges the following are mentioned:

The Baldwin, Occidental, Lick, Russ, Pleasanton and Silver State, the Merchant's Club, Pacific, Union Club, Bohemian Club, The Maison Riche, Marchand's, Vienna Model and all the Southern Pacific Railroad eating houses and principal hotels on the Pacific coast, also in the Christian Brothers, New St. Mary's College, Protestant Orphan Asylum, Old Ladies' Home and all the city, county and state institutions.

Some of the residences supplied with this superior cooking range are Charles Crocker, Senator Stanford's, Hopkins, Flood Mansion, Parrott, Palache, Daniel Meyer, Lilienthal, Walter, D. Samuels, H. Liebes, Capt. C. J. Harrison, Saucelito, and many others.

The Dyckerhoff Portland Cement.

When the Dyckrhoff Portland Cement Works were established at Amoenburg, near Biebrick and Mainz, on the Rhein, Germany, about twenty-seven years ago, it was then (as it always will be) the fixed purpose of Messrs. Dyckerhoff & Sons to produce a Portland Cement superior to any other, one of never failing quality, which will always permit its excellent properties to be utilized to the fullest extent with the utmost confidence in always producing the same results when employed under the same conditions.

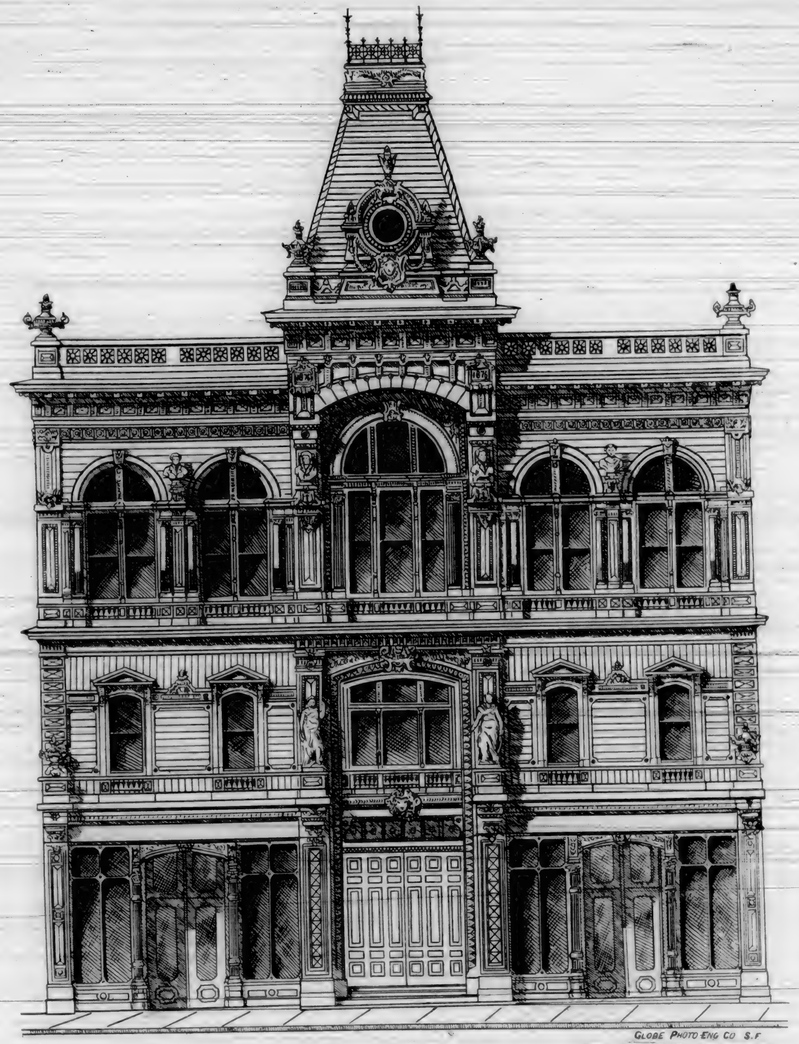
Aided by the natural advantages of excellent raw material close at hand, the adoption of al scientific and mechanic.l inventions and improvements, and with the constant and ever watchful supervision of all the details of manufacture, they have accomplished their purpose.

The high opinion in which their Cement is held everywhere, and the steady growth of their works to a present annual capacity of about 700,000 barrels, are eloquent testimonials of the extraordinary merits of this Cement.

Though the seller of any brand of Portland Cement, as well as of any other merchandise, may claim his brand to be the best (without which claim he would very likely not succeed at all), it is of the utmost importance that architects and engineers, as as well as masons and other consumers, should not permit any Portland Cement to be used unless they are fully satisfied that its quality is perfectly reliable and that its reputation for strength and uniformity is well established.

No Portland Cement should be considered *good enough, or answer the purposes*, unless it is the very best obtainable. In the absence of a simple and practical system of tests careful inquiry should be made as to which brand enjoys the highest reputation for excellence of strength and uniformity, and only such should be specified or employed.

The quality of the Dyckerhoff Portland Cement is unrivaled by any other. It is of



Metropolitan Temple. WM. MOOSER, ARCHITECT.

correct chemical composition, perfectly well burnt and very finely ground, and as the system of appliances of every stage of its manufacture is so complete, its strength, fineness and other properties are invariably the same.

The extraordinary fineness of the Dyckerhoff Portland Cement is a very important advantage.

Cement serves the purpose of covering and binding together grains of sand, etc. The finer cement is ground the larger will be the quantity of sand which a given quantity of cement can cover and intimately bind together. This explains the fact that the extraordinary and uniform fineness of the Dyckerhoff Portland Cement will permit the addition of 25 to 50 per cent. more sand than any other well known but generally much coarser brands of Portland Cement.

Its slow setting is another advantage of great importance, as it gives ample time for the proper preparation of the mortar. The hardening proceeds slowly at first but surely, and advancing in age, the material obtains increasing strength, as tests even after two years have shown. Most brands of Portland Cement will attain a certain degree of hardness, but this is not the only property required of a good Portland Cement. Many brands, owing to the imperfection of their composition or manufacture, will not stand the test of time and are subject to contraction or expansion in volume to the great injury of the work in which they may have been used. The Dyckerhoff Works, however, have succeeded in producing the strongest cement known, unalterably in volume, not liable to crack, and of a uniform and never varying quality.

THE PACKAGES

weigh 400 pounds gross and 375 pounds net each. The barrels are made at the cement works, of well seasoned wood, excellent heads and hoops, lined with tar paper to prevent the effects of moisture, and the workmanship is so perfect that they will bear the rough handling occasioned by repeated transportation without loss by breakage or sifting. The cost of these excellent packages is naturally greater than that of the packages in which most brands are being shipped, but the advantage to the dealer and consumer in receiving good packages and full weight, as against a shortage of from 3 to 5 per cent., which most brands suffer by reason of inferior packing, is of great importance.

The Dyckerhoff Cement weighs 113 pounds the U. S. bushel.

THE PRICE.

By reason of the great care bestowed upon the manufacture as well as upon the packages, its cost is naturally somewhat higher than that of most brands less carefully made, but the vastness of the quantity annually produced has lessened the difference in the selling price as against that of inferior brands to a mere trifle.

Inasmuch, however, as the consumer gets full weight and the extraordinary quality of the Dyckerhoff brand permits an unusually large addition of sand (25 to 50 per cent. more than other brands), it is not only the best and most reliable, but also the cheapest brand in the market.

The theory of some contractors, that for work to be done at a low figure they must necessarily use a low-priced cement is most erroneous. On the contrary, they ought to use the very best cement, without regards to its being a little higher in price. Careful consumers have long ago discovered that they can add enough more sand to do with 400 barrels of Dyckerhoff the same volume of work for which 500 barrels of an inferior Portland Cement would be required, and besides the great economy in cost they have the satisfaction of knowing, nay the guarantee of producing good and durable work, which with an irregular and inferior cement is always more or less doubtful.

The employment of low-priced Portland Cements to secure cheap work often results in serious defects or the ruin of the work after a short time, with consequent loss to owner or contractor. Many times the work must be done over again with the inferior cement, at first rejected, thereby doubling the expense of the job. By resisting the temptation of low-priced cements such losses can easily be guarded against.

The objects for which *Portland Cement may* be used are many, and constantly new applications are given to it; where formerly other materials were employed, *Portland Cement Mortar* is used for brick and stone masonry above and underground, for plastering fronts and brick houses, cellar walls, cisterns, for laying tiles, etc.

Portland Cement Concrete, composed of Portland Cement, sand and gravel or broken stone is employed for foundations and the construction of walls of buildings, foundations for heavy machinery, for foundations of asphalt and tile pavements, for abutments and roadways of bridges, in the construction of fortifications, piers, docks and river embankments, cable roads, gas tanks, aqueducts, water reservoirs, sewers, cisterns, etc.; in the manufacture of sewer pipe, ornamental vases, statuary, marbleized mantels and building stone.

Artificial Stone made from Portland Cement, is employed for paving sidewalks, garden walks, play grounds of school houses, corridors in hotels and theaters, railway stations and railway platforms, for fire and waterproof flooring in factories and foundries, breweries, malthouses, refineries, stables, engine houses, cellars, etc., and is much preferred to natural stone. Being applied in plastic state, any shape, the largest slabs, smoothest surfaces and closest joints can be produced.

Recently in a number of warehouses, breweries, etc., floors have been constructed of concrete arches resting on iron beams, with a smooth surface for the floor of the upper story, which proved stronger, more serviceable and cheaper than floors constructed of brick arches with a cement or asphalt surface for the floor above.

Directions for the employment of Portland Cement, preparation of Portland Cement *mortar*, of Portland Cement *concrete* and *artificial stone pavements for walks* and *flooring* are contained in our special pamphlet.

Numerous testimonials from architects, engineers, contractors and builders residing in the principal cities of the United States are also contained in our pamphlet and will be submitted to all interested parties when called for. The principal architects and builders in this city who have employed and used the Dyckerhoff Portland Cement in the erection of buildings here are:

Messrs. Percy & Hamilton, architects for the Academy of Sciences Building, the Alonzo Hayward Building.

Messrs. Pissis & Moore, architects for the Hibernia Bank Building.

J. K. Littlefield, Esq., architect, for the Concordia Club Building.

Henry Geilfuss, Esq., architect for floors and the erection of several brewery buildings and many private buildings.

Messrs. Wright & Sanders, architects for the State Asylum Buildings at Berkeley.

George Schussler, Engineer Spring Valley Water Works.

Kenitzer & Kollofrath, architects.

George Goodman, Artificial Stone Manufacturer.

Schulze & Meeker, architects.

Chatain & Gilletti, Artificial Stone, Mosaic and Concrete.

Ransome & Cushing, Concrete and Artificial Stone.

P. H. Jackson & Co., Manufacturers of Artificial Stone, Iron Vault Lights, etc.

Hugo Visher, engineer.

Marsden Manson, C. E., Chief Engineer State Harbor Commissioners, and many others.

For any other reliable information regarding the Dyckerhoff Portland Cement, cards and pamphlets, can be procured of the agents in this city, 314 Sacramento street, where samples of the cement made here and in Europe, together with briquettes in different forms can be seen and examined.

MESSRS. CHAS. DUISENBERG & CO., in San Francisco, 314 Sacramento street, below Battery, are the sole agents for the Pacific Coast.

Patent Water Closets.

If there is any one thing above another which should attract the close scrutiny and attention of the owner or builder it is the sanitary arrangements and appliances used in the building.

Nothing has a greater influence upon the health and comfort of the tenant than the sanitary arrangement, and more particularly upon the kind of water closet used.

The most natural and safest way to dispose of soil matter is to pour it out. The most simple, effective and common sense closet should be used, one with no complicated parts to get out of order, no noisy or uncertain action, no hidden or inaccessible receptacle for the accumulation of filth and the generation of deadly gasses and disease germs. Diptheria, typhoid, scarlet fever and numerous kindred diseases are in most cases traceable to defective water closets, and it is certainly to the interests of owners to use such closets as will prevent these gases escaping throughout the house endangering life and health and making the house lived in a veritable disease breeding machine.

Among the various water closets in use here in this city and on the coast, none stand higher than the Golden Gate Plug Closet, invented and manufactured by Joseph Budde, No. 43 Fremont street.

This closet is the very best of the kind so far constructed, and has the following advantages:

1st. It has a simple, strong valve, suitable for any pressure.

2d. It has a real sanitary overflow, a copper float attached to a bell of the same metal resting on the face of the brass overflow pipe, and operated by the rising of the water in the closet above its level, thus absolutely preventing any escape of sewer gas,

The Oriel Row, on Haight Street.

A. J. BARNETT, ARCHITECT.

even the closets being without water. No house supplied with these closets is troubled with sewer gas or other gaseous smells, and it is certainly the cheapest and best in the end to place such a closet in the building than to use inferior or poorer ones.

The establishment of Mr. Budde's is the largest of the kind on the coast, his closets being shipped throughout this entire section. He has every facility for filling all orders and contracts on the very shortest notice, his works being equipped with all modern machinery necessary for the conduct of his business. He has received several medals from the California State Agricultural Society, for the Golden Gate Plug Water Closet, it having been pronounced the best by competent judges and is in use in the buildings of the Sharon estate, in Bancroft's History building, 19 closets, Baldwin's building, occupied by Keane Bros. and Pinkiert, Market St., 10 closets, Chas. M. Plum & Co., Market St., 8 closets, Panorama building, 8 closets, New and Old City Hall, 14 closets, Liebes Bros. & Co., 4 closets, Grand Hotel, Lick House, Windsor Hotel, Nucleus, Hackmeier and other hotels, James C. Flood building, Abner Doble, Hinkle Houses, 30 closets, Hebrew Church, corner California and Stockton streets, Brooklyn Presbyterian Church, East Oakland and many others.

MR. George H. Wolfe, having no further connection with this journal, correspondents will in future please address their communications to the *California Architect and Building News*, 408 California street, San Francisco, Cal.

THE Consolidated Convention, which is to meet in Cincinnati on November 20th, will be of very considerable interest to architects. Of course we on the Pacific coast do not care much as to where the home office shall be. If they adopt the itinerant plan of changing it every year it may be our pleasure to see the headquarters in San Francisco for one year at least. We will pass that subject and only refer to the work which has been mapped out for it in advance. We understand that the following matters will come before the Convention: How shall the new institution be governed? Shall the profession be legalized, and applicants be examined for admission? Then there is the important matter of competition for public work. The Convention can do no better work than by formulating some plan by which competitions in future for government building and any public work shall not be open to persons whose qualifications to compete have not been passed upon, or whose greatest genius may be in their power to influence committees.

It is not to be dreamed that this convention will set all things at rest for all time, but we desire to see a code of laws established that will place the architects on a higher plane with the people than heretofore occupied by them. We expect eventually that architects will have the same legal standing that physicians and lawyers have.

THE adjourned meeting of the San Francisco Chapter, A. I. A., was held Friday evening, September 20th. The business before the meeting was the election of officers for the coming year, and the balloting resulted in the choice of the following: President, Seth Babson; Vice-President, W. P. Moore; Secretary, Oliver Everett; Treasurer, John M. Curtis.

After business had been disposed of, matters of current interest to the profession were brought up and discussed at length.

SELECTING the site for the Custom House and Appraisers' stores at Bowling Green is the most interesting event of the week architecturally. Government buildings in general are not matters of any special importance to architects, as they have heretofore been simply ground out of the Treasury. But under so capable a Supervising Architect as Mr. Windrim, we shall hope for better things. Recognizing the utter impossibility under the restrictions imposed by his position of his personally designing such a structure, we should be glad to see him inaugurate a change in the conduct of this important Government building by obtaining from Congress the authorization to offer to American architects a model competition. His experience in the practice of his profession would enable him to block out a competition that would attract the best talent. Then the site offers the opportunity of the generation for an imposing structure, whether viewed by sea or land, one that would impress every stranger on his first sight of our city.

The above editorial taken from *Building* advocates a change in the method of obtaining designs for government buildings, and the proposed change is one that we would most heartily endorse, and that would meet with the unqualified approval of the profession in general.

While undoubtedly many very meritorious buildings now are designed in the office of the Supervising Architect of the Treasury, it is sincerely hoped that Mr. Windrim whose abilities as an architect and whose interest in the welfare of the profession are well known, will consider the matter seriously enough to give it a trial.

Is it not reasonable to suppose that local architects familiar with the methods of construction most in vogue by the builders of their locality, more acquainted with the requirements necessary to make the structure harmonize with its surroundings, more interested in the erection of a striking monument, and ambitious to gain the distinction that comes from success in a public competition, should design a more noble structure than an architect (no matter how capable he may be) employed at a salary by the government, and who has no greater personal interest in his work than the reward of an approving conscience?

Owing to the changing methods of construction, and the enlarged number and variety of materials at the disposal of the designer of to-day, architecture is now passing through a period of evolution, that presents infinite and unparalelled opportunities for the display of originality in design, and the adaption of material to circumstances; and it seems to us but fit that our public buildings should be the medium of record of the best ideas of our foremost architects.

Our country is certainly rich enough not to look at the cost of obtaining the best possible designs and should follow the lead of the most advanced of European nations (notably France) among them by giving substantial encouragement and aid to the progress of the arts of civilization, and what art among them all is more worthy the aid and support of an enlightened government than the art of architecture!

The question is one of special interest to us at the present time, as our new post office building has become such an absolute necessity that some definite action cannot long be deferred, and what could be more appropriate than that it should embody the conceptions of some of our architects, of whom there are many worthy and capable of erecting a structure at once an ornament to the city and a credit to themselves.

Undoubtedly the change from the present method of proceeding would occasion difficulties at first and disarrange to a certain extent the present method, but the advantages to be gained would, we think, amply compensate for any trouble it would cause.

As an exemplification of the present method, take the Appraiser's, building in this city. The structure is substantial, and no doubt well adapted for the purpose, yet who will claim for it the least pretension to architectural beauty.

It is not necessary that the external finish of a building should be elaborate to produce an imposing effect, for skillful massing will produce almost as striking effects without as with the aid of ornamentation, and we venture to assert that a much more attractive building could in this instance have been produced at a very little greater expense, a building that would have been emblematic of the aims and purposes it serves, and typical of the people in whose midst and for whose use and convenience it was constructed.

WE PUBLISH in another column the experience of several English towns in the use of salt water for sprinkling streets and flushing sewers. The claim that salt water is more effective than fresh, for street sprinkling is undoubtedly well founded, owing to the well known affinity of moisture for salt, which would tend to prevent the rapid evaporation of the water. One of the objections urged against the use of salt water for sprinkling is that the dust arising from streets that have been repeatedly watered is so strongly impregnated with salt as to become injurious.

A. W. VON SCHMIDT has made a proposition on behalf of himself and partners, known as the Lake Tahoe and San Francisco Water Works, to furnish San Francisco with water from Lake Tahoe, to the extent of thirty to sixty million gallons of water daily. The proposition is a good one, as the people are longing for the fulfillment of a dream which has haunted their waking hours for years; but will any sane man think it will be realized just now? We think not. Mr. Von Schmidt says it will cost $15,000,000, and that the city should pay for it and become the owner. That is another good idea, but our "lawmakers," who never get up to the top story of a reasonable thought, will not permit Spring Valley to be flooded out with 60,000,000 gallons daily of pure crystal water from the mountains. You will never drink of Tahoe as long as there is any Spring Valley or Alameda County pasture drainage to give. Von Schmidt says Tahoe can supply 135,000,000 gallons daily, and not be lowered a foot in a year. Just think of it—and keep on in your reverie. You will have Tahoe nightmare and Spring Valley jimjams a great many times before your disgusted stomach is soothed and cooled by the transparent liquid from the Sierra mountain-sides. We wish Mr. Von Schmidt God speed in his undertaking, but the side doors and open hatchways of law and politics are so numerous that his scheme will probably be lost sight of, though the thought will still be sweet in the memory of his friends.

We again invite all architects or persons interested in architecture to visit our rooms and take advantage of the numerous publications on our tables.

TO THE fraternity of architects in California, Oregon, Washington and elsewhere on the Pacific Coast, we send this greeting: This journal being owned and published by many architects, there is no longer any personality about it—it is *of* all and *for* all. We have fitted up the apartments at 408 California street, San Francisco, in such a manner that we are not ashamed to invite you to visit us. We extend to you all a cordial invitation to call at our rooms and partake of the benefits. Should any of you desire to make our rooms a place of appointment to meet business men, do so; that is what they are for. Here you will find all the current literature of our profession, and we will always be cheerful in rendering you any assistance. If there is any information we can furnish you by letter, do not fail to write us, for we shall be pleased to serve you.

TO OUR SUBSCRIBERS we wish to say this: We desire to present you a journal of which you may be pleased to speak in complimentary terms, and as you pay your $2 each year consider that you have received more than your money's worth. That is our ambition and our purpose. To do this will take time, and your further assistance during the coming year. We shall furnish you with more and better representations of buildings and other architecture of importance, but do not expect to get fairly into line until our January, 1890, number. To this end we ask your encouragement by continuing your own subscriptions and getting your neighbors to do likewise.

ONE word to our advertising friends who have patronized this journal so faithfully in the past—Remember that it is under the direct control of architects, and is to be sustained by them. It is subscribed for by architects, contractors and builders, and will be distributed to and among that profession and calling throughout this Coast. We do not ask you to advertise unless you think it may benefit you—do not do so for "sweet charity's sake," but send us your advertisement in a business like manner, expecting to be pecuniarly rewarded through the circulation of the journal. Keep your wares directly before the people who use them and you will sell them.

CLASS journals are a necessity. In these days of rush and push it becomes important to have some method, or confusion, waste of time and energy will follow. Merchants locate their stores among others of the same class, professional men congregate in nearly the same locality, while bankers and insurance men select another spot, leaving the lumber and machine interests to go off by themselves. It is thus with newspapers and journals — the field is divided, each plowing in his own quarter and each reaping his own harvest. We were prompted to this thought by looking over our city files and seeing *Industry*, conducted by John Richards, a man not unknown to the scientific world; *Wood and Iron*, under the able management of Samuel Everett; *Pacific Lumberman, Contractor and Electrician*, guided by the skillful hands of W. L. and H. D. Peet; the patriarch of all, Dewey's *Mining and Scientific Press*, and our youngest contemporary, *Smith & Young's Building Advertiser*. Each has his work to do, and each is doing it well.

A few days ago a mass of brick work over the entrance of a Court room in the Old City Hall, was precipitated to the floor, owing to the breaking of the rotten wooden lintel that supported it. Fortunately nobody was injured.

Use of Salt Water in Cities and Towns.

An enormous saving in water would be effected if sea water were used in all cases where fresh water is not absolutely indispensable, and especially for such purposes as the flushing of sewers and the watering of streets. The advantages to be derived from sea water for such municipal purposes as the above have frequently struck engineers, and are set forth in a paper read by Mr. S. H. Terry before the Civil and Mechanical Engineers' Society. There have not been wanting schemes for supplying sea water even to inland towns, but hitherto it has been objected that sea water, though so abundant, was an expensive commodity to supply to towns, and it has even been asserted that the effect of sea water, on pavements for instance, was anything but beneficial. These ideas, however, have now been exploded.

A gallon of sea water contains about 2,500 grains of saline matter, of which about 1,890 grains are common salt—chloride of sodium—the remaining 610 grains being composed of other salts; and it is due to the deliquescent character of one of these salts, chloride of magnesium, that any material having once been moistened by sea water, remains moist for a considerable period. But, after storms, there is also present in sea water taken from near the shore in the vicinity of weed covered rocks, a considerable amount of organic matter from the destruction of seaweed, and the consequent mixture of its glutinous sap with the water. It is believed that it is to this glutinous material that the formation and endurance of the bubbles of sea scum, which occasionally, in gales, are driven some distance inland, is due. As, roughly speaking, about eighty pounds' weight of various salts are present in every water cart containing 224 gallons—one ton—of sea water, it will be seen that much material, which may or may not be injurious, is, in the course of a few weeks, spread over the streets of a town by the water-cart. This fact had created a feeling that the use of sea water for streets might not be without its dangers, and Mr. E. Buckham, M. Inst. C. E., Borough Engineer of Ipswich, was so much impressed with it that he instituted inquiries on the subject, and requested information from the engineers of thirty-five coast towns which had used sea water for watering the streets. Twenty-three of the engineers written to replied that they were no longer using sea water, as they had no works for that purpose; twelve stated that they were using sea water, some with suitable works, and some by merely filling the carts by hand; and two that they were about to have works.

The engineers of two towns; Ramsgate and Folkestone, spoke adversely of sea water, and stated that it destroyed all kinds of road material except wood. Some advised its use for sewer flushing, if a sufficient volume was employed; others, again, were of opinion that sea water tended to produce gas when brought into contact with sewage, and should not be used for sewer flushing except in large volumes. But it is probable that sea water only produces objectionable effects in sewers when these are particularly foul, and the influx of sea water stirs up the decomposing matter deposited in them. With regard to the efficiency of sea water as a means of preventing dust on roads formed of flint, gravel or granite, the testimony of those who have used it is almost entirely in its favor. Indeed, the Borough engineer of Berwick-on-Tweed goes so far as to say that persons having control of street-watering should use sea water, where it can be had, for reasons of economy, as well as for the comfort of the inhabitants. In his district he finds that one cart of sea-water is equal to two carts of fresh water, and gives more lasting and beneficial results. He states that the macadamized roads that are watered with salt water are a pleasure to drive upon in the summer season, as compared with those watered with fresh water, and they never seem to have a loose stone upon them.

In answer to Mr. Buckham's question, whether sea water occasions any offensive decay of street refuse, and if so, whether this is greater than would be occasioned by rain or fresh water, the pithy reply was; "No; when the scavenging of the town has been properly attended to." Without enumerating all the favorable answers that were received, it will suffice to state that the following important seaside resorts reported in favor of sea water: Portsmouth, Tynemouth, Great Grimsby, Great Yarmouth, Hastings and Littlehampton. Hastings, which has a population of 42,258, and a rateable value of £309,219, has erected extensixe works at a cost of £9,000 for sea-watering, which means a charge of about 3*d* per head of the population, or ½*d* on the rateable value. Great Yarmouth, with a population of 46,159, and a rateable value of £133,658, has completed works for salt-watering at a cost of £4,500. Here an 8-horse-power Otto Crossley gas engine has been erected, with a 12-inch pump, engine-house, tower and tank, containing 22,000 gallons, settling-tank and suction-pipe, fixed to the jetty. There are about 9,000 yards of main, ranging from eight feet to three inches, cast-iron socketed pipes, lead jointed, forty stand-posts, twelve automatic flushing siphons — 'ield's — each connected to tanks holding 2,000 gallons of sewer ..shing.

The total expenses, including interest and capital, repayment of loan in twenty years, depreciation of wages, gas, oil, etc., are under £500 per annum. For this amount some 30,000,000 gallons are raised forty-four feet at a cost of 4*d* per 1,000 gallons. Of this volume about 5,000,000 gallons are used for street-watering, and 25,000,000 gallons for sewer-flushing. Before these works were constructed, the cost of water for street watering alone was £404 on an average of each seven years, ending 1883. In 1885 it was as much as £552. To keep the automatic tanks of the size mentioned properly going the cost would have been £700 per annum. The charge for water at Yarmouth at that time was one shilling per 1,000 gallons. The cost of watering for street watering and sewer-flushing, including all items mentioned above, is less than three pence per head per annum, and sometimes under one penny in the pound. At Gosport a similar experiment has been made, with highly satisfactory results. The facts speak eloquently for themselves, and require no further comment. In some cases, however, the water companies offer a very strenuous opposition to the introduction of sea water, and Mr. Terry instances the case of Kirkhallerton, near Redcar, on the Yorkshire coast, where a very neat scheme was got out for the supply of sea water for street-watering, and it was also intended to supply sea water for bathers to the houses, and but for this intention the scheme would probably have been carried. The law here stepped in, and showed that inasmuch as the district was within the limits of supply of the Stockton and Middlesbrough Waterworks, a loan for such works of proposed supply would be illegal.

The discussion which followed Mr. Terry's paper was nearly all in favor of sea water. Its employment for the watering of streets, at any rate, is a perfectly practicable idea, and one that can be adopted with economy and success. The increasing size of our towns makes adequate supply of water annually a question of greater and greater difficulty, especially when we remember that with the spread of the scientific spirit of the age cleanliness may be said to be advancing at quite an alarming ratio, and that the demands made on our water-supply for municipal purposes are growing almost daily. In London this is felt very appreciably, and it would be interesting to see an experiment tried on a large scale of flushing our enormous sewers, and watering our interminable streets with sea water. For this purpose London is more favorably situated than any other capital in Europe almost, Constantinople and Lisbon perhaps alone excepted. At any rate, there is a strong feeling that something must be done, and that speedily, and Mr. Terry's paper may, therefore, be received as containing what, at least, appears to be a very practical suggestion, and possessing, moreover, the merit of being, as far as we know, the first attempt to bring together in an accessible form all the *pros* and *cons*, and experience and practice connected with the subject. The moderate cost of the pipes necessary for supplying even a large town places the proposal very easily within the reach of realization.—*Engineering*.

The Grant Monument Committee of New York find it impossible to get its members together to consider the designs that were invited nearly two years ago.

The newspapers of other cities are casting slurs on New York for its dilatory proceedings in this matter, and point to Chicago, where a handsome monument to the memory of our famous general has not only been projected but executed as well. However, we are in no position to cast a stone at Yew York, for we also are to have a monument some of these days, (though to commemorate a different event) for which the late Mr. Lick most generously provided funds, yet we are no further on the road to its realization, than is New York with its Grant monument.

We are always pleased to see a member of the Technical or Astronomical Society of the Pacific walk into their rooms adjoining the apartments of this journal. They are always open, and heaps of information lie there, subject to inspection.

Chapter Meeting.

The regular monthly meeting of the San Francisco Chapter, A. I. A. was held Friday evening Oct. 11th.

There were present Messrs. Saunders, Babson, Pissis, Percy, J. E. Wolfe, Curtis, Gash, G. H. Wolfe, Bestor and Everett.

The principal business of the evening was the installation of the officers elected at the previous meeting. The retiring officers were tendered a vote of thanks for their past services and the incoming officers duly installed. J. B. Whittemore was elected an honorary member.

The speeches of the retiring and incoming presidents were ordered printed in full in the official organ of the Chapter.

Owing to lack of space in this issue they will appear in our next number.

Headquarters Cincinnati Architectural Club,
Cincinnati, October 7, 1889.

Editor California Architect and Building News—Dear Sir: I herewith send you copies of circulars, etc., issued in connection with the National Exhibition of Architectural Drawings and Sketches to be held in this city in November next and contemporaneously with the Joint Convention of the American Institute and Western Association of Architects. The distance that is between us makes it somewhat difficult to create an interest in an undertaking of this kind among our local architects and designers. However, if such a thing were possible it must come through the efforts of the architectural press and so to you we would intrust the task of wakening up your professional men to attempt at collecting an exhibit for the occasion. As you will see by our circular, we have tried to reduce the trouble and expense to our contributors to a minimum. We have arranged to bear cost of transportation both ways, to insure drawings, etc. while in our possession, and to take every care of contributions while in our charge; all this only leaves to shippers the trouble of packing and delivering into the charge of an express company

I would like very much to write directly to some of your prominent architects and draughtsmen, and so if you would kindly send me a few such names I would take much pleasure in sending them direct invitations to contribute. I hope you may be able to do something for us. We are receiving notifications from almost every other part of the country and so we are naturally anxious to complete the representation by having something sent us from California. Our eastern cities will be well represented, and so far we have received assurances from Chicago, Minneapolis, St. Paul and Denver.

Yours very truly,
G. W. E. Field
Pres. C. A. C.

This exhibition will embrace the work of all Sketch Clubs and prominent draughtsmen in America and Canada. The following statement is made:

Works Exhibited.—Water color studies, India ink, pen and ink sketches, perspectives.

When to send,—*All* exhibits must be in Cincinnati by not later than Nov. 10th.

How to send.—All sketches must be properly packed, and sent by express.

Prizes,—Hinkle Gold Medal, (A. Howard Hinkle, Esq.,) for best exhibit of club work. Anderson Silver Medal, (Larz Anderson, Esq.,) for best individual work among club members. The Builder's Exchange will offer a medal for best Water Color perspective.

Jury.—Three prominent architects will act in this capacity.

Time and Place.—The exhibition opens Nov. 10th, continuing one week, and will be held in Pike's Opera House.

Further information will be cheerfully given, and all letters of inquiry are to be addressed to John Zettle, Secretary, Room 81, 227 Main street, Cincinnati.

The above communication was received at the last minute before going to press. Though the time is short, we hope the architects of this coast will not neglect this opportunity to contribute and make a creditable display at the exhibition.—[Editor.]

North-Western Lumberman—The mammoth Pacific Coast edition of this Journal, for Sept. covering one hundred and forty pages of reading matter and advertising has been laid on our table. It is full of lumber matters foreign and local, and under the management of that worthy jounalist J. B. Judson, of Chicago may be pronounced a success. Terms, $4.00 yearly

Our Illustrations.

The new management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication. Drawings should be made with perfectly black lines on a smooth white surface. The merits of all designs submitted will be passed on by the Board of Directors, and those chosen will be published in the journal without charge. All drawings will be returned to their authors, who must bear express charges both ways.

Page 134—Residence designed by T. H. Cole, a Los Angeles Architect.

Page 130—Residence erected on Scott street San Francisco, and designed by Wilcox, architect.

The plan and elevation of the Hibernia Savings and Loan Society's new bank building, now in course of construction on the northwest corner of McAllister and Jones street, Messrs. Pissis and Moore, architects.

The building will be entirely detached, and will be constructed of granite, gray for the portion below the watertable, and white Rocklin granite for the superstructure.

On the corner facing Market street will be the domed rotunda leading to the banking rooms situated on Jones street, and the rooms of the officers of the bank in the first story, and to the attorney's office on the second story of the McAllister street front.

The banking room will be 68 feet square and the full heighth of the building. The ceiling will be panneled and the center portion will have a domed ceiling light. The banking room will have in addition to the main entrance in the rotunda, a separate entrance with lobby on the upper end of the Jones street front.

At rear of banking room will be the vaults, one burglar proof and two fire proof, each to be 8x28 feet. There will be a basement under the whole structure 12 feet high.

The building will be completely fire proof. The total cost including vaults and fixtures will be about $400,000.

PERSONALS.

Charles D. Austin, "resident" architect of the Leland Stanford, Jr. University, visited the apartments of this journal a few days since.

Hans L. Schultz, civil engineer and naval architect of Philadelphia, who has concluded to make San Francisco his home, paid us a visit.

We have been pleased to find several situations for draughtsmen this month.

Burglars attempted to effect an entrance to the residence of brother B. E. Henrikson, one evening when he and his wife were attending the fair. The burglers were captured while trying to escape.

The new Chronicle building has now reached its full heighth. Mechanics are at work on the main cornices and tower.

K. Shimoda, a young Japanese architect from Tokio with the intention of learning American style of building is in town and visited our sanctum and desires a position in some local office.

Mr. E. J. Weston, the well-known architect of this city has gone to Puget Sound on business relating to the profession. He may decide to locate there permanently.

Those of our subscribers desiring the books mentioned in this journal, or any other architectural work, can have the same supplied through this office. Please make a note of this.

There is nothing like holding up your assertions with "facts." When a man or a firm can do that, all controversy as to his or their position must end. We are led up to this thought by the evidence placed before us in a new book just published by N. G. Taylor & Co., Philadelphia, as to the standing of their "Old Style" tin plate. They prove that they have laid the "Old Style" tin on 5,000 buildings, and that 50,000,000 square feet have been used without a single complaint. Such "positive proof" as they present will not go unheeded. "Facts" are stubborn things.

We solicit from architects throughout the Coast items of interest to the profession or the public. Our columns are open to the profession, and if thereby we can help them, or add to our usefulness, shall be doubly pleased. Remember that this is an architects' journal, and if you want to know what is going on here give us a chance to tell what is being done where you are.

Put the Wires Underground.

The National Association of Fire Engineers at Kansas city adopted resolutions concerning electric wires: We quote in part the conclusion.

Resolved,—That we earnestly call upon all municipal and legislative bodies, and urge the necessity of suitable legislation etc.

Resolved,—That we emphatically assert that the only safe method for currents is underground, and place our unequivocal condemnation on all overhead or suspended wires, etc.

It is said Chicago has 3,200 arc lights and every inch of the wire connecting these lights is underground. The potentiality of the current is 3,500 volts, and they work all right. It may cost more, but it is safe.

Validity of Contracts.

In the suit of Thomas Richardson vs. The College of Notre Dame, the annexed opinion was recently filed by Judge Spencer.

This is an action by the assignee of one Binet to recover the unpaid balance of the contract price for the erection of certain buildings for the defendant and for the value of extra work.

It is alleged in the complaint that on the 6th day of April, 1888, said Binet entered into a written contract with the defendant for the construction of certain buildings for the latter on its lands at Santa Clara, California.

That said contract was fully performed, the structure therein provided to be erected was completed by said Binet and accepted by defendant on the 29th of November, 1888.

That there is yet an unpaid balance of the contract price of $4,300.

That said written contract nor any memorandum thereof was never recorded in the office of the Recorder of the county where said premises are situated.

That no mechanics' or contractors' lien upon the property upon which said buildings were erected has ever been filed and the time for the filing of said lien has expired.

It is further averred that the contractor, Binet, did certain extra work on said buildings, at the instance of defendant, of the value of $1,170, which remains unpaid, and that no lien has ever been filed in relation thereto.

The prayer is for a money judgment for the sum due on the contract and the value of the extra work.

The complaint is demurred to on the ground that it does not state facts sufficient to constitute a cause of action, and the specific point urged in support of the demurrer is that by the Amendment of March 15, 1887, to Section 1183, C. C. P., the contract sued on is void, and that no action can be maintained thereon.

The provision referred to in the cited section is as follows: "In case of a contract between the reputed owner and his contractor, the lien shall extend to the entire contract price, and such contract shall operate as a lien in favor of all persons except the contractor to the extent of the whole contract price, and after all such liens are satisfied, then as a lien for any balance of the contract price in favor of the contractor. All such contracts shall be in writing when the amount agreed to be paid thereunder exceeds $1,000, and shall be subscribed by the parties thereto, and the said contract, or a memorandum thereof. * * * shall, before the work is commenced, be filed in the office of the County Recorder of the county or city and county, where the property is situated, * * * otherwise they shall be wholly void, and no recovery shall be had thereon by either party thereto."

If our attention be exclusively confined to the provisions cited, and no regard paid to the context or subject matter of the legislation therein dealt with, the question presented would be of easy solution in favor of the demurrant. But in the same chapter a subsequent section is found, which provides that "nothing contained in this chapter shall be construed to impair or affect the right of any person to whom any debt may be due for work done or materials furnished to maintain a personal action to recover said debt against the person liable therefor." Section 1197.

This section has remained substantially the same since the adoption of the codes, with the exception that the original section in addition authorized the issuance of an attachment, notwithstanding the existing lien and without impairing it.

It is insisted on behalf of the defendant that the provisions of the two sections are inconsistent with each other, and so wholly irreconcilable that they cannot stand together and both be given effect; and that section 1183, as amended, being the later enactment (the first amendment, containing the nullifying provision, was passed March 18, 1885,) repeals by implication the original Section 1197 and its amendment of March 24, 1874.

On the other hand the plaintiff contends that:

First—Section 1197, being the higher number, must prevail over the lower numbered Section 1183, in conformity with the rule prescribed in Section 4484 of the Political Code, and

Second—That the entire Chapter 2 of Title IV., in which the several provisions under consideration are found, deals exclusively with the subject of mechanics' liens and their enforcement, and that the proper construction to be given to the language found in Section 1183 is that the contract "shall be wholly void", as the basis of a lien "and no recovery shall be had thereon" in an action to enforce a lien.

In support of this contention he calls attention to the headnotes to the chapter in question and insists that the entire scope of the chapter is in relation to liens, and cites decisions by the Supreme Courts of this and other States to the effect that the title of an act, although no part of the body, may be referred to as tending to explain the intention when the language is doubtful, and that the headnotes to subdivisions of an act indicating the particular subjects treated of in the several chapters are entitled to even more consideration for that purpose. (Barnes vs. Jones, 51 Cal. 306; ex-parte Koser, 60 Cal., 198.)

The headnotes of this chapter indicate that it is devoted to "Liens of Mechanics and Others Upon Real Property,' and the whole scheme and spirit of the entire chapter is manifestly devoted to that subject, but a careful perusal of all its provisions clearly demonstrates that the Legislature was specially solicitous in the first instance to protect sub-contractors, laborers and material men who might be employed by or furnish materials at the instance of the original contractor, and as one of the means for affording them protection against the fraud or negligent conduct of both the contractor and the owner, provision was made for giving at least constructive notice of the terms of the contract by requiring it to be in writing and placed of record.

This requirement is reasonable and just and in order to make such provision effective it is competent for the Legislature to provide such penalty for its non-observance as it may deem proper, including that of declaring the contract void and prohibiting any recovery upon it.

It further occurs to me that construction contended for by the plaintiff is insufficient to satisfy all of the conditions in which the parties would be placed thereby.

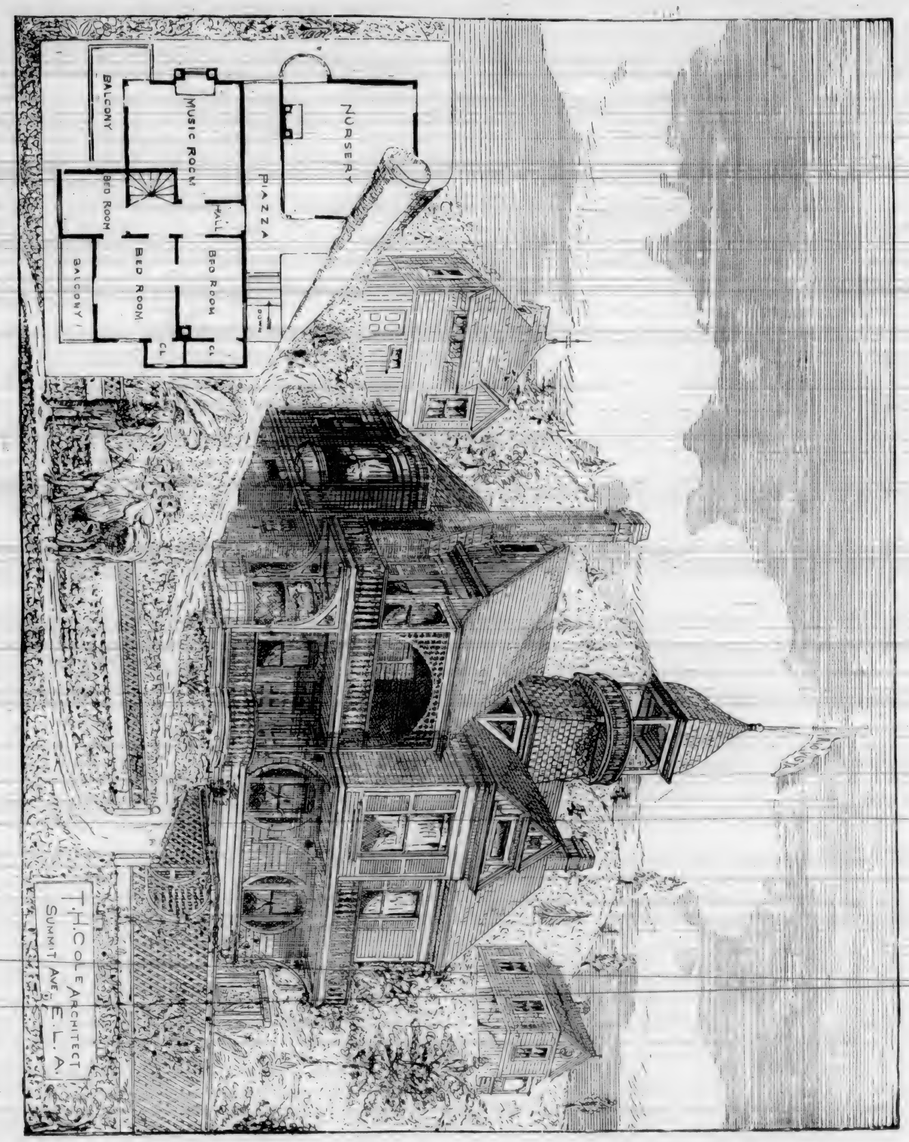
If the provision was that the contract should not be enforced against the owner, it might possibly be harmonized with the construction contended for by the plaintiff, but the declaration is that "No recovery shall be had thereon by either party thereto." That is, that not only the contractor shall not recover the contract price but the owner shall not be allowed to recover thereon for any damages he may sustain by reason of a breach on the part of the contractor.

It will be further observed that, pursuing the controlling idea, the Code provides that notwithstanding the fact that the contract was made void for failure to record it, the subcontractors, material, men, etc., are protected by allowing them to treat the derelict owner as their employer in place of the contractor who may have in fact employed them, and then give them a lien upon the property for the work preformed by them.

The right to thus hold and enforce liens by material men against the premises was recognized in the case of the Giant Powder Co vs. San Diego Flume Co., 20 Pacific Reporter, 420, a and it may not be improper to advert to the fact that Justice Thornton in delivering the opinion of the court in that case, in speaking of the effect of the failure to record the contract, says: "The section of the Statues which declares such contracts wholly void, declares how far it is void" citing Section 1138. "The statute only declares the contract void as detween the parties to it."

Although the rights of the contractor and owner as between themselves were not the subject of direct inquiry in that case, yet the validity of the contract was collaterally in question and a necessary subject for consideration, for if the coutract had been held valid and enforceable no question could have arisen as to the rights of the material men thereunder in their dealings with the contractor.

I do not deem it necessary to consider the question whether or not Section 1197 supercedes Section 1183, for the reason that



I am of the opinion that the two sections can be harmonized and stand together.

As I have already indicated, Section 1183 should be construed as declaring that the unrecorded contract is absolulely void. Being void, it creates no liability, no debt or other obligation, it is *nudem pactum*.

Section 1197 speaks of a debt due for work done or material furnished and declares that "Nothing contained in this chapter shall be construed to impair or affect the right" to maintain an action to recover such debt.

But it is obvious that if the contract and its performance does not create a debt, we must look elsewhere for the subject of the action preserved by the last cited section.

This I think, is readily found in the implied agreement arising from the performance of the labor by the builder or so-called contractor, and the acceptance of such labor by the owner.

I think it is reasonable and just to hold that the contract being void and not enforcible by either party, that there should be no obstiacle to the operation of the implied contract to pay; not a specific sum for a specified labor, but to pay the reasonable value of the services rendered by one party and accepted and enjoyed by the other.

I am therefore of the opinion that the second count which sets forth a claim for extra work, outside the written contract, and seeks to recover the reasonable value thereof, states a good cause of action, and that the demurrer thereto should be overruled.

For the reasons already indicated, I think the demurrer to the first count should be sustained, and it is so ordered, with leave to plaintiff to amend his complaint and count on a *quantim meruit* for the labor performed in the erection of the buildings if he shall so elect.

The Annual Meeting of the Stockholders of the California Architectural Publishing Company will be held in the rooms of the company at No. 408 California street on Tuesday, November 5th, 1889, at 10 A. M., to hear the report of officers, elect directors for the ensuiug year and transact such other business as may properly come before the meeting.

W. P. Moore, President. Oliver Everett, Secretary.

San Francisco, Cal., Oct. 12, 1889.

WASHINGTON ITEMS.

On account of the heavy rain on the latter days of September, the brickyards of Washington Territory are quite all shut down and the making of bricks cannot be commenced until near May 1st, 1890. The price offered now for bricks, is now about $14, and a manufacturer near Seattle refused $14 for 200,000 although he had 2,500,000 on hand, but he needed those for contracts made in Seattle at less prices.

Already 1,000,000 bricks have been used on the new Denny hotel in the basement, and 2,000,000 more will be required. The basement walls of this hotel, if placed in a straight line, it is said, would reach nearly a mile in length.

The Rainer hotel at Seattle is nearly roofed in, and Diller's hotel is up to the first story.

At Ellensbrugh, eighty-four new brick stores are going up and a stone banking house.

Speaking of brick, we understand several of the manufacturers will put in dry kilns before the next season commences so that nature may not compel them to stop on October 1st, of every year.

The Builders Material Company, is putting a new pressed brick machine on Vashon Island, which will turn out 20,000 bricks a day and they have a plain brick machine already in operation

Building in Seattle and Spokane is going on at a lively rate, some 600 to 800 dwellings being in construction at the present time at Seattle. These houses will cost all the way from $1,000 to $2,000, and seldom over $4,000,

We would infer from the newspapers of Seattle that the architects who competed for the plans of a new courthouse for King county were not fully alive to the peculiar necessities of such an institution, and that a Board of Commissioners had been found up there who knew just what King county wanted. Something like sixteen plans were submited in competition with estimated cost running from $175,000 to $200,000 and all were rejected—rejected because the plans were not suitable for King county. The motion to reject was certainly not very complimentary to the architects engaged, but then, the Board may have desired to show what they know about architecture.

Query: Is it possible that sixteen different architects, or firms, were each and all so deficient in the knowledge of what was required of them that it takes the plans of the sixteen to make an acceptable design.

We think this emphasizes what we have sometimes said, that it would be far better to place the acceptance or rejection of designs for public work in the hands of a competient committee of duly qualified architects. When this shall be the rule there will be a great advance in these buildings.

As a result, architect W. A. Ritchie is set to work making plans from the rejected "Greek" plans, changing it from a two-story and basement to a three story and basement building. The appearance of the new courthouse will suggest the Ionic style as intended. The basement will be of cut stone and the first and second stories of brick with stone trimmings. Seattle is looking forward to an imposing structure, that will be known the moment you look at it, and be taken for a real genuine courthouse as well as one that will not burn up on the slightest provocation.

REVIEWS.

We have received from Wm. T. Comstock, Part IX of his architectural studies, (city houses). This number illustrates the best designes submitted in a competition given by *Building*, for the planing of a home for a professional *literateur*, and contains several excellent solutions of the problem. Price, one dollar, postage paid.

The Brickmaker a semi monthly publication at Chicago. Price, $1 per year. As the name indicates, its columns will be entirely in the interest of the brickmaker and his bricks. In this connection we notice one very sensible article on the "Nomenclature of Bricks" and the suggestion that the matter be settled at the convention to be held in Philadelphia next December.

The Canadian *Architect and Builder* publishes a very caustic criticism on the "abuse" of the inverted arch. The criticism, though written in an "inverted" style of composition, is nevertheless effective in pointing out the possible failure of such an arch when not constructed on scientific principles, and the supervising architect is not fully alive to the importance of its use.

Preliminary Notice.

The joint Convention of the American Institute of Architects will be held in Cincinnati, opening on Wednesday, 20th of November next, at 10 A. M.

The annual reports to and of each organization shall be read, and the Constitution and By-laws recommended for the reorganized Institute by the joint Committee on Consolidation, appointed by the two bodies, will be submitted for the final action necessary to consummate unification.

This will be followed by the reading and discussson of professional papers.

An exhibition of architectural illustrations, under the direction of the Cincinnati Architectural Club, will occur simultaneously with the Convention, viz: Tuesday, November 19th, to which all the members of both existing organizations are cordially invited.

Before the close of the convention, opportunities will be afforded for the inspection of the prominent and interesting structures of the city, finished or in process of erection.

Members of either existing organization, having communications or papers of interest to the professsion, which they propose to submit to the joint Convention, should forward them to the appropriate Secretary before the 1st November ensuing.

Full particulars will be forwarded, in due course, to the members, alike of the existing Western Association of Architects and American Institute of Architects.

Joint Committee of Arrangements: E. H. Kendall, Chas. Crapsey, N. S. Patton, Secretary W. A. A., 44 Montauk Block, Chicago. A. J. Bloor, Secretary A. I. A., 18 Broadway, N. Y. September 19th, 1889.

CITY BUILDING NEWS.

Austin and Gough. Owner, Alice Kennedy; architect, James E. Wolfe; contractors, Gray & Stover; signed September 26; filed September 27; cost, $6 600; grading, artificial Stone pavement; payments, $1,600, piers are done; $275, completed; $ 25, 35 days.

Broderick, between Haight and Waller. Owner, W. E. Dennison; contractor, F. W. Kern; surety, Behrend Joost; signed Sept. 18; filed Sept. 20; cost, $4,855 100 days; 2-story frame; payments, $1,200 ready for lathing; $1 200 hard finished; $1,200, completed; $1,255, 35 days.

Broadway and Gough. Owner, Amelia L. Leszynsky; architect, J. Marquis; contractor, C. Coady; signed Sept. 12; filed Sept. 21; cost, $4,525; to build; payments, $600, framed; $800, floors laid; $800, brown-coated; $1,075, completed, $1,150, 35 days.

Bush and Baker. Owner, Chas. W. Kenitzer; architect, Kenitzer & Kellofrath; contractor, A. Miller; sureties, Chas. F. Dee and John C. Roberts, $3,000; signed September 24; filed, September 26; cost, $6,650; December 20, 1889. Two-story frame; payments, $1,000 framed; $2,000, roofed; $1,600 ready to paint; $400, completed; $1,650, 35 days.

Broderick and Haight. Owner, Wm. W. Bishop; architects, Townsend and Wyneken; contractor, R. O. Chandler; signed, September 24; filed September 26; cost, $5,477; painting; payments, $500, outside first coat and inside second coat is on; $500, outside second coat and inside last coat is on; $750, accepted.

Brine, between Howard and Folsom. Owner, John Wyhs and wife; architect, Fred Weinoehl; contractor Fred Weinoehl; signed, Sept. 4; filed, Sept. 4; cost, $3,950, 90 days, carpenter work; payments, $600 framed; $800 under roof, etc; $400 brown mortared; $700 white mortared; $560 50 completed; $987 50, 35 days.

Bluxome, between Fourth and Fifth. Owner, Mrs. M. F. S. Searles; architects, Schulze & Meeker; contractor, John T. Grant; cost, $1,175; signed, September 7; filed, September 11; 25 days complete a stable; payments, $881, completed; $294, 35 days.

Clara Lane, bet. Bush and Butte. Owner, F. Lemme; architect, P. R. Schmidt; contractor C. Chisholm; sureties, James Conlin and J. J. McKinnon; signed, Sept. 28; filed, Sept 30; cost, $11,700; 95 days, 3-story brick; $2,200 second story joists laid; $2,200 topped; $2,200 basement floor laid; $2,100 completed; $3,000, 32 days.

California and Broderick. Owner, Mrs. H. B. Healey; architect, C. C. Morehouse; contractor, James Campbell; signed Sept. 30; filed Oct. 5; cost, $4,290; Jan. 1, '90; to build; payments, $900, roof-boards on; $1,020, sash es set; $1,250, completed; $1,060, 35 days.

Clay and Hyde. Owner, Martha McL. Ewer; architect, Clinton Day; contractor, George V. Hussey; signed Oct. 1; filed Oct. 2; cost, $7,900; to build; $1,100 sheathed; $1,400 chimneys built; $900, prime coat of paint on; $1,000, inside ready for painter; $1,525, completed; $1,975, 35 days.

Clinton Park and Dolores street. Owners, Henry Pregge and wife; architect, Bernard Dreyer; contractor, Bernard Dreyer signed Oct. 1; filed Oct. 2; cost, $5,500; 90 days; 2-story frame; payments, $1,375, framed; $1,375, brown mortar on. $1,375, white mortar on; $1,375, completed.

Church and Army. Owner, F. F. Speckman; architects, John & Bolczynski; contractors, Schutt & Krecker; signed Sept. 28; filed Oct. 2; cost, $4,665; 2-story frame and stable; payments, $800, framed; $800, partitions set; $1,000, outside finish on; $900, inside ready to paint; $1,165, 35 days.

Cor Baker and Vallejo. Owner, H. R. Hopps; contractor, J. A. Rommel; sureties, F. and M. Marcuse, $1,500; signed, Aug. 29; filed Sept. 14; cost, $2,250; Jan. 15, '90; to build; payments, $462 50, framed; $462 50, brown coated; $562 50 completed; $562 50, 35 days.

Capp, between 22d and 23d. Owner, Mary E. Von Schroder architect T. J. Welch; contractors, Brennan & Fladung, signed September 27th; filed September 28; cost $6,100; 24 days; payments Painting, &c; 75 per cent. as work progresses balance.

Clayton, near Page. Owner, Frederick Bryan and wife; architects, John T. Kidd; contractor; John Bruce; signed, Sept. 4; filed, Sept. 4; cost, $4,145, 70 days payments, $900 framed; $500 plastered; $300 white coated, etc; $209 completed; $538, 35 days.

Church near 21st. Owner, S Stemmer; architect, Wm. Mooser; contractor, A. C. Rogers; sureties, C. S. Holmes and H. C. Simmers, $2,500; signed September 14; filed, September 23; cost, $3,900; frame building; payments, 75 per cent as work progresses; balance, 35 days.

Eddy, bet. Fillmore and Steiner. Owner, S. F. Laundry Assn; architect, Percy & Hamilton; contractor, Richardson & Gale; signed, Sept. 26; filed, Oct. 1; cost, $1,795; chimney 100 feet high; 75 per cent. on completion; bal. 35 days.

Ellis and Levenworth. Owner, A. C. Heinken; architects, Townsend & Wyneken; contractors, The Grey A. S. P. Co.; signed, September 24; filed September 26; cost, $2,500; two dwellings; payments, $900, enclosed; $1,000, water pipes in; $1,000 inside hard finished; $1,000, completed; $1,300, 35 days.

Ellis and Polk. Owner, P M. Flood, architect, Wm. F. Smith; contractor, F. W. Kerr; cost $6,880; signed Sept. 4; filed Sept. 13; $1,290 framed; $1,290 ready for plastering, $1,290 ready for painting; $1,290 completed; $1,720, 35 days.

Eddy and Larkin. Owner; Sacred Heart College; architects, John J. Clark; contractor, George Goodman; signed, Aug. 22; filed, Aug. 31; cost, $200, artificial stone sidewalk, etc; payments, 75 per cent. as work progresses, balance, 35 days.

Eddy and Lagunt. Owner, Maurice Getz; architect; John Gash; contractors, Rohlings & Crawford; sureties, F. Joost and Humboldt Mill Co.; cost, $7,660; signed Sept. 6; filed Sept. 11; two houses; payments, $1,500 frame 1; $1,000 brown mortared; $1,100 white mortared; $1,110 outside finish on; $1,100 completed; $1,990, 35 days.

Eighteenth street, near Clover Alley Owner, Johanne Petsch contractor, J. C. Brown; signed, Sept. 7; filed, Sept. 7 cost, $1,010; payments, $250 framed; $300 all frames set $250 white coat plaster; $210 completed.

Fourth and Townsend. Owner, Mary K. Knoll; architect, M. J. Walsh; contractor, M. C. Lynch; signed, Sept. 19; filed, Sept. 30; cost, $13,858; to build; $3,464 50 roofed; $3,464 50 first coat of mortar is on; $3,464 50 completed; $3,464 50, 35 days.

Folsom and Caroline. Owner, John Tamoung; architects, Townsend & Wyneken; contractors C. A. Naherty; cost, $3,780; signed Sept. 11; filed Sept. 12; 3-story frame; payments, $1,400 framed; $1,780 brown-coated; $1,700 white-coated; $1,700 completed; $2,200, 35 days.

Folsom near 11th. Owner, Chas. Bogan; architect, James P. Chadwick; contractor, Mayler & Green; sureties, Matthew Harris and Hugh B. Jones $4,000; signed, September 23; filed, September 24; cost, $6,700; 90 days, four flats; $1,256 25, roofed; $1,256.25, brown coated; $1,256.25, outside finish on; $1,256,25, completed; $1,675, 30 days.

15th, near Castro Owner, John Dolan; contractor, A. J. McKee; signed, Aug. 15; filed, Sept. 4; cost, $2,400, Nov. 20, '89, two story house; payments, $700 inclosed; $700 brown coated; $1 000 completed.

Folsom and 23d. Owner, P. H. Bielenberg; architect, W. Winterhalter; contractor, George W. Farnum; sureties, F. Joost and W. Thyarks; cost, $5,600; signed Sept. 18; filed Sept. 18; 90 days; 2-story frame; payments, $1,200 enclosed; $1,000 brown-mortared; $1,000 hard finish on; $1,000 completed; $1,400, 35 days.

Folsom, corner of 2nd and Dow Place. Owners, Boyd & Davis; architect. Jno. M. Curtis; contractor, H. W. Hannemann; sureties, Chas. Schroth and M. Shotwell. $7,000; signed, Sept mber 26; filed September 28; cost, $4,988; to build; payments, 75 per cent. as work progress; balance, 35 days.

Folsom, between 13th and 14th. Owner, Geo. Schafer; contractor, F. L. Hanson; signed Sept. 13; filed Sept. 17; cost, $7,375; two 2-story frames; payments, $1,500 framed; $1,000 enclosed; $1,500 rough mortared; $1,875 white mortared-$2,000, 35 days.

Greenwich and Taylor. Owner, Maria San Pedro; architect B. E. Henriksen; contractor, Robert Currie; signed Sept 16; filed Sept. 17; cost, $9,400; three 2-story frames; payments, $1,705 roofed; $1,705 brown coated; $1,705 white-coated; $1,705 trimming on; $2,280, 35 days.

Geary and Octavia. Owner, Francisca E. de Los M de Smith; contractor, Geo. E. Voelke; contractor, F. Klatt; sureties, Behrend Joost and J. F. Kennedy; $8,000; signed Sept. 14; filed Sept. 19; cost, $11,340; 2-story frame; payments, $500 first-story joists are on; $1,700, plumbing done; $2,500 brown coated; $2,50 second coat of plaster is on; $1,205 accepted; $2,840, 35 days.

Geary and Devisadero. Owner, August Brune; architect, Emil John; contractors, Schutt & Krecker; cost, $4321; signed Sept. 6; filed Sept. 10; 2-story frame; $800 framed; $ 00 enclosed; $800 white coated, $921 completed; $1,100, 35 days.

MR. George H. Wolfe, having no further connection with the business of this journal, correspondents will in future address their communications to the *California Architect and Building News*, 408 California street, San Francisco, Cal.

AN IMPORTANT extension of the fire limits is under consideration by the Board of Supervisors. The changes, as proposed, enlarge the limits to include the business portion of Hayes Valley, besides other blocks nearer town.

The change is not viewed with favor by the property-owners in the limits affected, judging by the number of protests that have been made to the committee. This is a case, however, where the public good takes precedence over private interests, and the property-owners should take the matter as philosophically as possible.

The blocks in the proposed new limit are mostly pretty well covered with frame buildings, and the owners claim that if they had to rebuild they could not afford to put up brick buildings, and that consequently their property would depreciate in value.

Now, it seems to us that in case a building, in close proximity to other buildings, is burned, that the new building erected to replace the one destroyed should be so constructed as to give some sort of protection to its neighbors, which were undoubtedly jeopardized by its destruction.

The fire commissioners are acting for the good of the city in urging the adoption of this new ordinance. It is particularly necessary to have as many protections and barriers as possible against the spread of a conflagration that is particularly liable to spread in a city of frame buildings, such as ours, where the fire department, according to the repeated warnings of Chief Scannell, is not kept up to the requirement of the increasing demands on its service.

THE REGULAR monthly meeting of the San Francisco Chapter of the A. I. A. was held on the evening of November 8th. The routine business of the society was transacted. A paper on the "Architecture of Japan" will be read at the next regular meeting, Friday evening December 13th, by a young Japaneese architect, Mr. K. Shimoda. Interesting photographs and drawings of Japanese constructions designed by Mr. Shimoda will be exhibited in illustration of the paper. All members of the profession whether connected with the chapter, or not, are cordially invited to be present.

WE ARE in receipt of the journal of the Royal Institute of British Architects, September 26, 1889, and also the Kalendar of that body for 1889–90.

The editor in his "notes" commenting on various architectural publications that appear at the Royal Institute compliments this journal for the "rapid strides it has made in the path of improvement." Under the same heading it advances an idea which is worthy of consideration by architects on this coast, and that is: "There is no better form of profitable advertisement than the reading room table in the library of the Royal Institute of British Architects."

The application of this apparent truism is that the rooms of the San Francisco Chapter of the A. I. A. might be made the depository of all the leading publications useful to the profession—while the same rooms could be made a place of general resort to compare ideas or mould public sentiment. Let us ask a question. Is there a body of men in our community who by a combined and energetic move in the line of public improvements sanitary measures, and the general beautification of this city could do more than the architects? Can you suggest who it would be?

The merchant has his Chamber of Commerce—the grain man his Exchange—the stock men, their Board—the laboring men have their various unions, clubs and exchanges—and yet, the men who are determining the character of our public works seem to be shy of forming a "Board" or place of general meeting.

There never was a better opportunity than now, and there is no fitter place than the rooms of this journal. Here the Technical society, the Astronomical society, and the San Francisco Chapter of A. I. A. all hold their meetings. Here can be gathered all the current literature desired by the profession—and further than that, this journal is the organ for the whole body of the profession and its columns are open for their communications. Shall we have an architectural Board, reading room, and exchange?

THE ANNUAL ADDRESS

Delivered by President Sanders before the San Francisco Chapter of the American Institute of Architects at the monthly meeting, October 11, 1889.

Gentlemen: Leaving to my successor, Mr. Babson, the pleasing task of portraying the future, I will merely take a brief backward glance at the past two years, which seem to call for some remark, as presenting matter for reflection, and which I will endeavor to state in the following cursory observations:

The first point to which I wish to draw your attention is the generally thriving condition of the architectural art throughout this continent, and particularly within the bounds of the United States. Indeed, it may, perhaps, be truly said to be, practically, almost confined to this country; for while the broad area of the dominion of Canada exhibits much sympathetic interest in the progress of architecture, and is making commendable efforts to hold up her end of the plank, yet it must be confessed it is, after all, pretty much as she receives the sun's rays in winter. She is on the northern rim of the temperate zone of the art, and must be looked upon as a truly sturdy dwarf, rather than as a well-grown and developing tree, such as the art presents in appearance within the bounds of the Union. Southward, again, in Mexico, for instance, I should conclude that the torrid zone began to get the best of it, and that the capabilities of the art are at the present time undeveloped from precisely opposite causes; nature there does too much instead of too little, and the rational incitament to progress in the arts is the lacking element, instead of that arising from the overbalancing conditions of natural obstacles to advancement, as in the North.

A rapid run through the principal cities of the Northern States and Canada, last year, made this condition of things so far apparent to me, as the eloquent records of the truly magnificent publications of the *American Architect* and the *Inland Architect* indicate, unequalled as they are, so far as I am aware, by any similar journals in the world—a notable fact on which American architects are to be congratulated. The same fact is also made apparent by the flourishing condition of the two great professional societies which have sprung into life in this country, which are now betrothed and soon to celebrate their nuptials in a union as notable as it is auspicious; a union, indeed, not of contending factions, but of bosom friends—of complementary parts of one great whole—of Eastern delicacy and refinement with Western energy and independence! Long may the union of the Institute and the Western Association continue, and firmly may it be cemented, and a glorious family of subordinate Chapters and Associations may they raise, and as the result thereof, may there also be a development, not of a single style, but many; as many as the States; aye, if you will, as many as the counties, cities, towns, and even villages, throughout this broad land! For I hold that art is as various as the rational human mind from which it springs, and which is, in its turn, born of the breath of that Divine power which breathes the universe into existence, and which, while it leaves its impress in some peculiar beauty on each created object throughout the stupendous whole, will undoubtedly, through the mediumship of intelligent human efforts, stamp a reflection of his own individual image on every work of man.

And here it is in order to remark that, in point of fact, the profession of architecture in America seems really to have only practically come into existence as such, during the past century.

In the early years of this republic, when the Capitol at Washington was designed, it must not be forgotten that the first adopted scheme was not that of an architect, but a physician; and it would seem that most of the old colonial buildings were erected, not by architects, *as such*, so much as by the local builder, mason or carpenter, as the case might be. These men seemed to be content with producing very excellent work in its way, and to have been only careful to follow in the footsteps of their predecessors from the parent soil. Nevertheless, a careful examination of old colonial architecture unmistakably indicates an individuality not recognizable in any particular trans-Atlantic style that I am acquainted with, though generally allied to those which came into vogue during the Hanoverian era in England.

A stroll through Germantown, in the neighborhood of Philadelphia, and in the older streets of New York, seems to make this to me quite apparent; the variations and differentiations which can be seen in the delicate and very carefully executed designs of the various structures remaining, are confined within very narrow limits indeed. When professional architects of any note became known as such, and the profession began to be recognized, apart from the practical builder-architects above alluded to, may be difficult to determine, but the rise of the profession, in America, would seem to date from a period subsequent to that time. At all events, the formation of the Institute and the publication of the *American Architect* undoubtedly had great influence in giving an impetus and a dignity to the calling, which nothing else could have accomplished so speedily or so well.

The respectable position and progressive condition of the art of architecture in America at the present time, is also undoubtedly due in great measure, to the active and organized efforts of European schools to establish correct principles of study and practice on their side of the ocean.

Following the great Renaissance wave, which, after sweeping before it the effete and corrupt remnants of the glorious vernacular of the middle ages itself broke in shattered ruins on the rock-bound shore of artistic debasement—came that great movement, the Gothic revival. The "Battle of the Styles" followed speedily; then the Queen Anne question, the Eastlake craze, and, later still, the Romanesque development supervened, the most important of them all, in this country, at least, and is probably the only one likely to leave any visible solid results, in an artistic sense, behind.

In California we have only begun to join in the race, and it behooves us to cautiously examine, and carefully to weigh the principles of design offered for our imitation and adoption by our eastern brethren. For though we may indeed receive much benefit by judicious observation from their example and experience, it is rather by suggestion of fresh developments than by servile imitation of any style or styles of art, however intrinsically good they may be in themselves, that any advance can be made or that the peculiar adaption of means to ends may be brought about, by which the "personal equation" can be realized in our municipal, state and national art. The tendency to coalesce indicated by the union of the two bodies into which the profession has hitherto been divided, is one also to which we should give a good heed. The formation during the past four years of an architectural league in the Eastern and Middle States, and the effort to organize a body of the same kind in San Francisco, is an indication that the motion to combine among the seniors has not been without its effect on their subordinates. If guided by judgment, pursued with perseverance, and followed up by study and effort, which alone constitutes the real value of such an organization, it cannot be doubted that great good may be effected by the movement.

Some years ago, it was determined by the San Francisco Chapter to inaugurate regular classes for the benefit of the young men who might be attached to the offices of architects connected with the Chapter, either as articled pupils or as employees This was effected in an imperfect way by the establishment of three classes, one in geometry, Mr. John Gash teacher; one in practical architecture, Mr. Albert Pissis, teacher, and one in freehand drawing, under the present incumbent. In due time also a class for the study of French was inaugurated with good results while it lasted. These classes for a time were quite successful and a large amount of work was turned out of more or less merit. Some competitions were arranged, prizes given, and much interest was manifested, both by principals and pupils in the progress of the school; by degrees, however, interest flagged, one class after another was dropped, and at last only the drawing class remained. This has been maintained under varying circumstances, and with some unavoidable interruptions, to the present time, with the exception of a short interval during which the class was given up in favor of those established by the Architectural League. This organization was formed on similar principals to those existing in eastern cities; but the classes, only two of which were organized, have been given up and the Chapter class has been resumed and is now beginning to assume somewhat of its former aspect. If the other classes could be also resumed, there is no reason why they might not be as successful as ever. What is lacking is first, interest and assistance on the part of the Chapter; second, attendance of the Chapter's students whom the members of the Chapter should encourage in joining; third, voluntary teachers in mathematics, architecture and construction. During the short time at the command of the one teacher on one evening of the week, it is out of the question to conduct more than one class. The work of the class is to draw from flat studies and models in charcoal and crayon, and from natural foliage in color, and to sketch from nature on Saturday afternoons, hitherto once a month. Were the Chapter to take the interest they once did, in these classes, by offering premiums in competition, and opening the pages of their journal for the publication of the successful designs, etc., there is every reason to suppose that they would prove of great use to the young generation of architects now growing up in our midst.

It was proposed early in the year that an exhibition should be held in connection with a reception. Were something of the kind to be inaugurated, it is probable that fresh interest in the Chapter would be excited and an influx of new membership would immediately ensue.

During the past year the Chapter has engaged rooms of its own and is now no longer indebted to another society for the use of their apartments, and we feel it incumbent upon us to acknowledge the many favors and the great kindness shown us by the San Francisco Art Association.

The movement to purchase the The California Architect and Building News from its original founder and publisher, James E. Wolfe, Esq., and the formation by members of the profession, of the corporation who now own it, is one altogether in the right direction, and cannot fail to greatly add to its influence and to a reflex advantage to the profession in California.

If properly supported, energetically conducted, and perseveringly pushed up to the highest state of mechanical and artistic perfection, not only may a successful and distinctive journal be inaugurated among us, but the reactionary effect upon our professional community could hardly be estimated at its true value.

The modern development of architectural study and practice in America, and to some extent throughout the world, indicates the slow but sure establishment of true principles, and a knowledge of design which will doubtless result in an individualizing of a variety of styles, having a common basis of utility, beauty and truth, which will find its adaption in every direction and every country with the happiest effects. But the future and its developments I beg to leave with the best of wishes to my worthy successor. With these few words, thanking you earnestly in my own and fellow officers, names, for your cordial co-operation in the past, and bespeaking the same for our successors in the future, I beg leave to introduce our next president, Mr. Seth Babson.

THE INAUGURAL ADDRESS

Of Mr. Babson, President of the San Francisco Chapter A. I. A, delivered on the Evening of October 11, 1889.

Gentlemen and Members of the Chapter.

I thank you for the honor bestowed in selecting me as your presiding officer for the coming year. Gratifying as may be the feeling, with regard to your preferment, it is not unaccompanied with a certain degree of solicitude that all of your expectations may be realized.

I shall rely upon your good sense and magnanimity, to assist in preserving the honor and standing, and increasing the influence the Chapter has obtained under the management of our worthy past President, his able Vice assistant and their predecessors. We should ever keep in mind the objects stated in article II of our Constitution which reads as follows: "To unite in fellowship the architects of the Pacific Coast, encourage, promote and sustain professional standing, dignity and harmony, to stimulate friendly intercourse, and to combine in efforts for the promotion of the artistic, scientific, and practical proficiencies in the profession. * * * * * *"

Separated as we are from the great centers of the eastern population, we miss that attrition of thought and sentiment, the leaders of the profession enjoy in thickly settled communities of long standing. We miss their charming display of art treasure and their wealthy patrons, whose influences develop into life and intense activity the sleeping resources of the American genius. But notwithstanding our isolation, thrown more upon native ingenuity and a cosmopolitan taste, a type of architecture has been developed essentially characteristic of the wants and tastes of the coast.

The Chapter and its work are evidences of the efforts the Pacific Coast architect has made to lift the profession to a higher plane of excellence and usefulness, and to-day it is looked upon as a nucleus by many of its members, around which happier sentiments will gather, and from which a loftier ambition may reach out for distinction and honor.

The coming year should be one of increased interest for old and new members of our profession. The fact that the parent organization, The American Institute of Architects and the Western Association of Architects, are to unite their fortunes for the formation of a grand head family to lead the profession onward, will be hailed with delight by every lover of his profession. This means a more rapid stride towards a national style of architecture, a higher standard of practice among its votaries, and a quickening of the ambition of the architect to improve the grand opportunities of the age. For within its fostering circle will be gathered the learned professor of architecture as well as the most able and boldest of the creators of those magnificent modern structures now completed, and in course of construction, adorning the great cities of the country.

All honor to those of our predecessors, and present members, who have so faithfully sustained this organization through all these many years of existence. And to those who have made it a part of their professional duty to inculcate correct principles of drawing and a pure taste for architecture among the students and draughtsmen employed in the various offices of the city, by sustaining classes which are open to all connected with the Chapter, a great measure of praise is due. Their reward is to be found in the position many of the former students now occupy as active members of the profession.

It is hoped that all the recipients of this free-class training will show their appreciation of these advantages by their assistance in perpetuating and sustaining the good work for the benefit of their successors. There can be no honorable practicing member who has at heart the well-being of his fellow men who is not solicitous for the advancement of his profession beyond its present status, both with regard to honor, and its qualifications for creating a higher and more beautiful type of architecture.

To create a beautiful design is to add to the sum of human happiness, through the exercise of the higher faculties of our being

With the growing facilities for education and culture the human mind is pushing onward with rapid strides to satisfy its longings, with but an imperfect equipment for the struggle. In an address by Professor Comfort, before the Western New York State Association of Architects, a short time since, the Professor says: "I only repeat to you what I have often stated to the students of our university, that, in my opinion, you represent the most rising and important profession, the one which offers the most promising and attractive opportunities to young men of talent in our land." In no other profession is there so limited a number who are fully qualified to meet the great demands of the country, or, indeed, the present generation of its patrons.

But a new period is upon the world. In the future the architect in America must have an extensive scholastic training before entering upon the practical work of his profession. It is to this new period in architecture which is pressing rapidly upon the country, to which I refer in calling architecture the most inviting profession to young men of talent in our land. * * *

Through the influence and power of the vast expenditures of money to replace the burnt cities of Boston and Chicago, architecture has sprung with a giant leap into a condition of life challenging attention and demanding study and training on the part of its votaries to retain their leadership and satisfy the demands for higher attainments.

To guide the profession to a higher condition of excellence and honor will require the united efforts of the most practical and the most accomplished architects of the present generation. With especial force will these remarks apply to the western portion of our country, toward which population is advancing with unprecedented strides. Whatever can be done to develop a correct taste and produce a higher standard for the architect should receive the best efforts of the members of this Chapter. To do this, a little self denial must be practiced and more service thrown into the scale of honor and public good.

The owners of the Palace Hotel have on foot a project to rearrange the first story with a view to improve the general disposition of the rooms. One of the main objects in view is to secure more sunlight for the parlors. Architect Wood has the project under consideration.

Vodge's Architects' and Builders' Pocket Companion and Price Book. 368 pages; full bound, $2.00; cloth, $1.50.

Bricks, Tiles, Terra Cotta, etc.: A practical treatise on same by Charles Thomas Davis. Second edition; 217 engravings; 1 volume, $8.00; cloth, 501 pages, $5.00.

Front Elevation

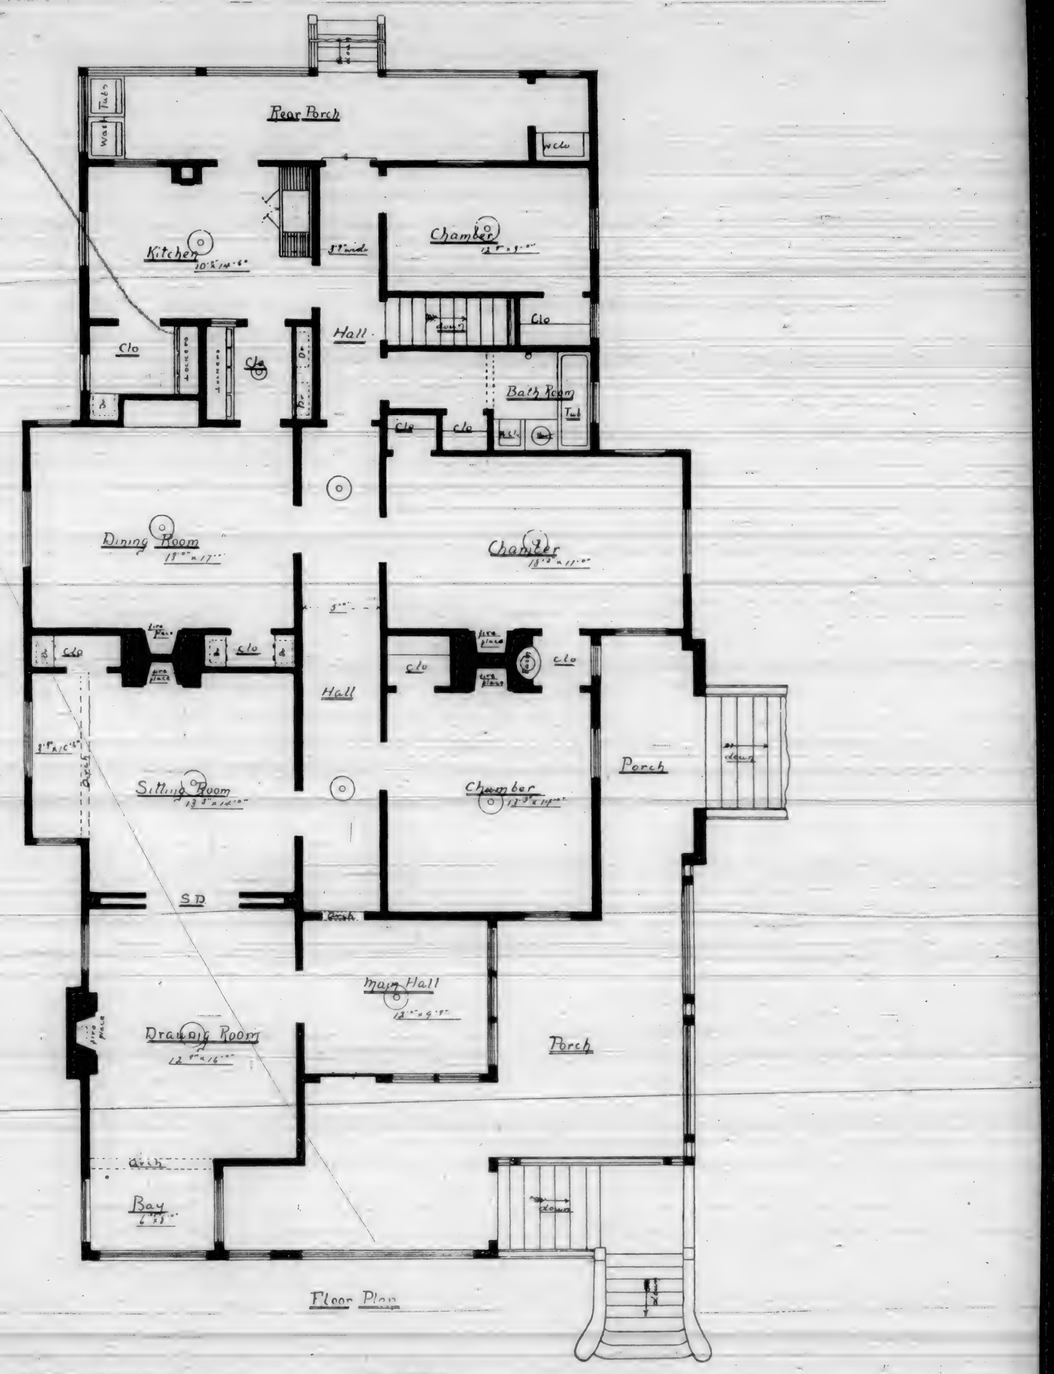
PLATE 1. SAMUEL NEWSON, ARCHITECT

NEXT to the education of the school and college, there is nothing more beneficial to the student than travel abroad. And we do not mean to be understood as limiting our remarks to the student who has just left college, but would include all people of intelligence who have not yet gone too far down on the shady side of life. The representatives of any business or profession who would not be benefited by travel in foreign lands are few or none. We are all apt to settle down into narrow grooves and to create for ourselves a little world of our own, beyond which we so seldom look, that we begin to believe that our own selfish and narrow interests are the only ones of any importance. But when we once "tear ourselves away" from this rut into which we have unconsciously fallen and travel in other lands with open eyes and receptive mind our ideas of life are enlarged, our store of knowledge increased, and we lose sight of our own petty cares in the new interest awakened within us by a view of the varied and wonderful industries and enterprises in the great world around us; we return to our business or profession with broader views of life and a precious store of valuable information for the entertainment of our friends and our own personal profit. Among all professions none, probably, receive more benefit from an extended course of travel abroad, than the architect and artist. To the architect the prospect of a tour in foreign lands opens up a delightful visit of grand possibilities. What may he not accomplish after he has studied the works of the great minds on other shores, looked upon the ruins of ancient Greece and Rome, and visited the cradle of architecture still watched over by the silent and inscrutable Sphinx in Egypt. The very thoughts of it fires his imagination and thrills every fibre of his being with the keenest anticipations of of pleasure. A trip abroad is the architect's opportunity, and dull must be he who does not avail himself of all the advantages it affords; especiaially when at present the other attractions are heightened by the Paris Exposition. The International Congress of Architects which was held at the same place lately was an event of great interest, and attracted representatives of the profession from various countries throughout the world. When shall we attain a position in the architectural world which will warrant us in holding an International Congress of Architects and inviting our foreign brothers to the United States? It is just possible that they might even now be able to learn something of us in regard to the interior domestic arrangements of our dwellings, methods of heating, and many of the mechanical devices and inventions which enter into our buildings and constitute our "modern improvements." Notwithstanding the fact that we have no ancient ruins nor old historical associations to attract the travelers from foreign lands we may certainly lay claim to some advantages over our brothers in the old world.—*Architectural Era.*

In this connection we notice that some of our architectural exchanges, and particularly the *Building and Engineering Journal*, of Australia, are urging that "some vigorous efforts should be made to secure for young students of ability and promise the benefits of travel." by the establishment of traveling scholarships. Here is an opportunity for the Chapter of A. T. A. to instigate a movement in the right direction for the encouragement of the young.—[Editor.

OBITUARY.

WE REGRET to chronicle the death of Michael Joseph Kelly, who was one of the prominent contractors and builders of this city, and who had charge of erecting many large buildings.



SAMUEL NEWSOM, ARCHITECT. PLATE 2.

WASHINGTON NEWS.

Seattle is to have a new opera house, the cost of which including the site for same will be quite $300,000. Competition will be advertised for so that all the architects of the country will have a chance. The promoters of this enterprise are Thomas Ewing, John Leary and others. Geo. F. Fry also intends to erect within a year one of the finest opera houses on the Pacific Coast. It will be L-shaped 75x180x120 feet, three stories in height and constructed of brick, iron and stone. Seattle's new court house is to be one of the best buildings in the Northwest. Architect Ritchi has submitted the revised plans which show a building with a frontage of 195 feet and a depth of 125 feet, while rising high above the roof is an immense octagon tower 100 feet higher than the roof and 160 feet from the ground. Architect W. E. Boone has finished the plans for Dexter Harton's immense building on corner Second and Cherry streets. This structure in connection with the one adjoining will be known as the "Seattle Block." Size of the new portion will be 120x108 feet, six stories in height, and built of stone and brick. Cost of the new building $200,000. John Leary has just received from Comstock & Trotsche the plans of his new five story hotel to be erected on Marion street, of brick, stone and terra cotta; cost of building $60,000. The foundation for J. M. Colman's immense block is completed at a cost it is said of over $40,000. The building itself will only be finished to the second window and temporarily roofed in for the winter. The Hotel Rainer is completed and this is the way they figure the time and labor on it. 3,500 days work all told, and distributed as follows: carpenters, 1,800 days; masons, 500 days; painters, 300 days; electricians, 100 days; steam heaters, 156 days and the balance common labor. The time actually consumed was two months, so say Larimer & Waite, the contractors. Architect Boone also awarded the bids for Mrs. L. M. Starr's new seven story building on the site

It would be simply impossible to name all the substantial improvements going on in Seattle at the present time. To use the language of the Seattle *Post-Intellingineer* it "would take thirty days to complete such a record." This is the way they sum it up: Front street—Busy workmen building big blocks on both borders. Commercial street—little space that is not occupied by solid buildings. South Second street—The clang of the trowel heard on every hand. South Third street—Structures crowded along the limit of the limits of the fire district. Second street—many splendid structures rising to lofty heights. Third street—Dexter Horton's massive block on Third street is being roofed. There is no retreat from the sound of the hammer, the rattle of the saw, the clang of the trowel and the click of the stone chisel

Port Townsend is talking about a $150,000 hotel, and J. E. Clark, Frank A. Bartell and R. B. Hill have been appointed a committee by the Chamber of Commerce to work the matter into shape.

Ellensburg has completed work on 75 storerooms, some of which are three-story buildings and mostly finished in brick and stone. It is expected that as many more will be completed in the next sixty days.

Hoquain on Gray's Harbor is having a boom and money is being spent on public improvements, wharves and stores in a manner that indicate great confidence in the future.

At Puyallup, C. T. Uhlmannn of Tacoma, has purchased a tract of land for $10,000 and is to erect a meat packing establishment to cost $40,000.

Cosmopolis is advancing to the front with rapid strides and bidding for public attention, Already a handsome City Hall has been erected—a day dock is to be built—and new mills and shops are going up—verily the great Northwest is waking up.

CORRESPONDENCE.

Mr. R. H. Daley submits for publication the following invitation of which he was the recipient as a sample of the kind that are too frequently made to induce Architects to risk time and money to enter a wild-goose-chase. The italics are ours.

Mr. Daley's reply to the invitation was brief, and intimated that he did not enter architectural competitions on the terms offered.

Office of the
Masonic Hall Association of Alameda,
Dated, Alameda, Oct. 29, 1889.

R. H. Daley, Architect: The Board of Directors of the above mentioned association hereby advertise for plans and specifications in detail for the erection of a three-story brick and stone building with basement, on the south-west corner of Park street and Alameda avenue, in the city of Alameda. Said building to occupy about sixty feet on Park street and one hundred feet on Alameda avenue. All plans to be drawn to one-fourth inch scale. *The Board reserves the right to reject any and all plans and specifications presented for adoption in reply to this advertisement, and* no compensation *will be allowed to any architect whose plans and specifications may be rejected.*

Plans and specifications presented for adoption under this advertisement will be received in the office of said Association, Bank of Alameda, on or before November 23, 1889.

For further information apply to A. Gewer, 323 Front street, San Francisco, and Wm. O. Dickson, P. O. Box 36, Alameda.

A. Gewer, Pres.
Wm. O. Dickson, Sec.

Please notify the undersigned of your intentions in this matter. Details at my office A. Gewer.

MECHANICS' LIENS.

Another Point Decided by the Supreme Court—Material Men May Recover From the Owner on an Unrecorded Contract.

The Supreme Court has decided a case which is of great importance to owners. The suit was that of Kellogg et al. vs. Howes et al., appealed from the Superior Court of Los Angeles county.

The action was brought by the plaintiffs as material men, laborers and sub-contractors against the defendants to enforce a lien for material furnished and for labor done in the construction of a dwelling. The defendant, Howes, was the owner of the real estate, and contracted with his co-defendants to construct the building, and the latter contracted with the plaintiffs for the labor and material done and furnished by them.

The contract between the owner and his co-defendants was not filed for record as provided by the Civil Code. The owner had paid the contractor the greater portion of the contract price, but when suit was brought had not a sufficient amount of the contract price remaining to satisfy the claims of plaintiff, though before the contractor had been paid there was more than enough to satisfy such claim. Judgment passed for the plaintiffs for the full amount of their claims, and the defendant Howes appealed.

The question on appeal was whether or not a material man or sub-contractor can recover beyond the amount unpaid by the owner to the original contractor on the contract where it has not been recorded, and where no personal notice has been given by such material man or sub-contractor to the owner to withhold the payments due such contractor, the material man and sub-contractor having actual notice that there was such a contract.

The Court, after reviewing the cases on that subject, decided that the material men and sub-contractors under the circumstances named can recover for the full amount of their claims, even though it exceeds the amount of the contract price remaining in the hands of the owner unpaid; and it is no answer for the owner to say that it works a hardship or injustice on him. As the contract between him and the main contractor is not filed as required by statute, it is wholly void, and the material men and sub-contractors should proceed to enforce their lien as if no contract existed. The judgment and order of the lower Court in favor of the plaintiffs were accordingly affirmed.

Our Illustrations.

Plates 1, 2 and 3 show the plan and elevations of a residence designed by Samuel Newsom, architect.

Plates 4 and 5, a residence erected by Seth Babson, architect.

Our double plate No. 6 is the perspective view of a commodious country residence designed for D. Freeman, Esq. by Messrs. Curlett, Eisen & Cuthbertson, architects of Los Angeles, Cal.

Building Supplement and Trade Reviews.

VOLUME 10. NOVEMBER 15, 1889. NUMBER 11.

The Ideal Sash Pulley.

The accompanying cut shows the No. 21 Ideal sash pulley manufactured by the Stover Manufacturing Co., Freeport, Ill., who claim for it several points of excellence not to be found in any other make. The pulley wheel has a cone axle cast to it, under a new process, which it is claimed by the manufacturers greatly enhance the working qualities.

1st. In point of accuracy.
2d. In the matter of durability and light running.
3d. Renders it perfectly noiseless inoperation.

The bearings in case are made wit hreference to the cone shaped axle of pulley and when put to actual use, the weight and sash weight applied to the sash cord running over the pulley wheel causes it to run to a center or midway between the two sides of case, thus relieving it from contact with sides of case and overcoming the fric tion and noise.

This company makes various styles of cone axle bearing sash pulleys together with a line of builders' hardware, which are already very popular with the trade. The pulley shown in this connection is more particularly adapted for the mill trade, as it is readily applied with mortising machines such as are in general use, or may be applied by hand in the usual way. The company will on application send sample free with catalogue illustrating the different style soft goods manufactured by them.

N. & G. Taylor Company.

In our last issue we should have stated that the firm of N. & G. Taylor, now N. & G. Taylor Co., was established in 1810, and it sold what is now known as the Taylor "Old Style" brand of roofing tin as early as 1830. The manufacture at that time was necessarily crude. A sheet of 10x14 bright tin was dipped by hand in a bath of molten lead, but the result was the best roofing tin that ever had been or has been made, its utility being demonstrated after forty years of use. About 1873 N. & G. Taylor Co. entered into an arrangement with Leach, Flower & Co., of Neath, Wales, the makers of the finest plates known for deep stamping, for the production of what, having regard to the beginning, was now called the "Old Style," these words being selected as a brand which had never been used before. Among the prominent buildings covered with this tin may be mentioned the Government Printing House at Washington, National Soldiers' Home, Los Angeles, and Independence Hall, Philadelphia.

A subscription to the Architect *now* will entitle you to the November and December numbers of this year free. Only $2 per year, and each number will contain a representation of some important public or private work.

Architectural and Mechanical Works.

In our list below will be found the names of books on architectural and mechanical subjects, the prices of which have been greatly reduced if taken in connection with the California Architect Old subscribers will be given the books at a large discount, so that they may feel that no favoritism is shown. It will be noticed that some of the books are given free to new subscribers.

	Price of Book.	With *Cal. Architect.*
Mechanics' Geometry	$5 00	$5 57
Monckton's National Carpenter	5 00	5 75
Cottages	1 00	5 40
Shavings and Saw Dust	1 50	2 75
Moore's General Assistant	2 50	2 25
Plaster and Plastering	1 00	3 40
Hand-Book of Legendary Art	3 00	2 75
Manual for Furniture Men	1 00	3 40
Water Closets	1 50	2 40
Cutting Tools	1 50	2 00
Sewer Gas and Its Dangers	1 25	3 50
Handrailing and Staircasing	1 25	2 75
Sloan's American Houses	1 50	2 75
Amateur Mechanic's Workshop	1 50	2 00
American Cottage Builder	3 50	3 00
Wheeler's Rural Homes	1 50	4 00
Burns' Ornamental Drawing	1 00	3 40
Manual of Drawing for Carpenters	3 00	2 00
Steam Engine Catechism	1 00	4 40
Grimshaw on Saws	4 00	2 75
Modern Low-Cost Houses	50	4 00
A Cosy Home	25	2 00
California Picturesque Architecture, No. 1	3 00	4 00
California Picturesque Architecture, No. 2	3 50	4 25
The Artisan	5 00	5 75

The following are justly recognized as standard publications. Some of them are perfectly new works, but we make the same general reduction:

	Price of Book.	With *Cal. Architect.*
Tredgold's Carpentry	$ 7 50	$ 8 25
Building Construction, 3 vols., Smiths	14 00	14 75
Picture Making with Pen and Ink	4 00	5 25
New Cottage Homes and Details (Palliser's)	4 00	5 25
Palliser's New Quarterly, per year	3 00	4 00

We can furnish any book printed at publishers' prices, and will send all books free by either mail or express.

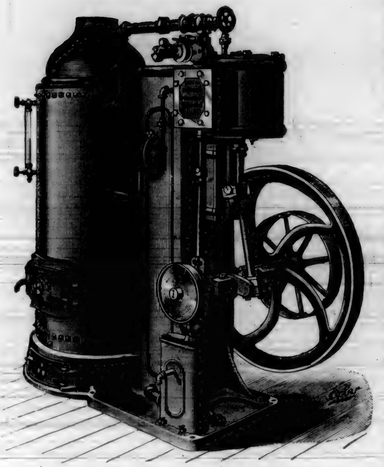
A Treatise on Masonry Construction.—This work is the out-growth of the authors own class room and nearly all the matter is believed to be entirely new. The suggestions in the book are from practical masons and engineers. The structures illustrated are actual ones, and the illustrations all from well authenticated copies of working drawings.

Although the book has been arranged for architectural and engineering students, it will still be useful for a man of experience.

Contents: Materials and method of testing strength, etc.; combinations of material, composition, etc.; *Foundation*—testing the bearing power of soil, etc; *Masonry Structure*—stability against sliding, over-turning, crushing, etc. Complete in one volume of about 500 pages, with 125 illustrations and eight or ten folding plates. By Ira O. Baker, C. E., 8 vo., cloth, $5 00.

For sale by John Wiley & Sons, 15 Astor Place, N. Y.

Examples of American Domestic Architecture: By John Calvin Stevens and Albert Winslow Coff. 60 full-page plates, etc. One large quarto oblong volume; cloth; $10.00.



WILLARD CONDENSING ENGINE.

The extensive sale of gas engines and hot-air engines, notwithstanding the high cost of the engines, and of gas, reveals the very general demand for an engine of small power, say 2 to 4 H. P., for the use of small industries, which shall be *perfectly safe*, and the manufacturers of the Willard Condensing Engine (of which we give an illustration), who have been engaged in the manufacture of small engines of various types for the past ten years, believe that, in this new engine, which they have now put upon the market for the first time, they offer a motor which possesses all the advantages of other motors of this class, and is free from the structural faults that exist in some of the other machines. The manufacturers claim that the cost of fuel will not exceed one per cent per horse-power per hour that it requires no watching; does not increase the rate of insurance, can be safely managed by a person having no knowledge of engines, and that it is absolutely safe under every and all circumstances, and cannot be exploded, because there can be be no steam pressure whatever.

The manufacturers, in putting this engine upon the market, desire to impress upon the public the fact that it is not a hot air engine or a kerosene oil engine or a gas engine, but it is a condensing engine using a small quantity of steam at less than one pound pressure, burning wood or coal, and is perfectly simple and reliable; making no noise or objectionable smell.

A full descriptive circular with illustrations and prices can be obtained by addressing Chas. P. Willard & Co., 236 Randolph St., Chicago.

Cincinnati Corrugating Co.

The Cincinnati Corrugating Company has recently established new rolling mills and factories at Piqua, Ohio, a thriving manufacturing city about eighty miles north of Cincinnati. The company's latest catalogue reads as follows: "In our new location, we have the most modern rolling mills, operated by natural gas and under our sole control; the most improved processes of annealing, forming, galvanizing and painting our iron and steel sheets; machinery for grinding and mixing our paints; ample buildings and grounds, comprising fourteen acres for extending any buildings made necessary by the development of our specialties, as well as good railroad connections for obtaining the lowest freight rates." The catalogue further contains illustrations of corrugated arches, curved roofs, corrugated buildings, elevator sheets, iron frames, lathes, metallic paint shutters, etc., besides giving invaluable information upon the subject. The edition consists of 10,000 copies, is copyrighted and should be in the hands of everyone interested in the building trade.

Merchant & Co.

We are always pleased to congratulate our business friends on any sign of growing prosperity, or to mention a fact which would seem to bring them into a prominent position in the country. How many of us will think during the next few years that possibly every penny or nickel that jingles in his pocket passed through the factories of Merchant & Co. Most people think their "tin" comes from the mint, but where did the mint get it? From Merchant & Co.!

The well-known firm of Merchant & Co., Philadelphia, has just closed a contract with the United States government to furnish the Mints with 100,000 pounds copper blanks for making pennies, and 50,000 pounds nickel blanks for coining five cent pieces.

CITY BUILDING NEWS.

Bartlett near Twenty-fifth, 2d story to chapel. Two story frame. Owner, Chas. Jacobs; architect W. H. Weihye; contractor, Wm. H. Griffith; cost, $4,250; signed October 15; filed October 19; time to February 1, 1890; payments, brick work done, $1,000; enclosed, $1,150; completed, $1,100; 35 days. $1,100.

BERKELEY.

Dwight Way, near Fremont; 2-story frame. Owner, A T. Eggleston; contractors, Higginson, Davisson & Co.; cost, $2,069.50; signed Oct. 19; filed Oct. 29; payments, enclosed, $413.90; brown mortar on, $517.37; ready for paint, $517.37; 35 days, $255.

MISSION SAN JOSE.

Addition to Catholic church. T. Carraber; architect, T. J. Welch; contractor, Frank Davis; cost, $1,094; signed and filed Oct. 28; payments, completed. $794; 35 days, $300.

NEVADA CITY,

Gehrig's brewery to be rebuilt; stone work completed; roof of corrugated iron; cost, $11,000. other roofs in the city will be covered in the same manner.

ALAMEDA.

St. Charles street, near Central avenue; frame dwelling. Owner, Mrs. M. H. Pennell; contractors, George N. Quinn & Co.; cost, $1,355; signed Oct. 10; filed Oct. 30; payments, frame up, $250; enclosed, $250; brown mortar on, $350; completed, $250; 35 days $255.

Encinal avenue, between Walnut and Oak streets; cottage. Owner, John Brick; architect, John Stubight; contractors, Miller & Conant; cost, $1,830; signed and filed Oct. 31; payments, frame up, $100; chimneys built, $440; ready for casing, $572.50; 35 days, $477.50,

Frame. Owner, Williams; contractors, Geo. N. Quinn & Co., cost, $1,650; signed and filed October 14; payments, frame up, $250; inclosed, $150; brown mortar on, $320; completed $500; 35 days $300. Another frame. Owner, Halsey; same contract.

Block 17 Ala. Park Homestead; two-story frame. Owner, Henrietta E. Culver; architect, Schuler & Meeker; contractor, Wm. Winnie; sureties, O. Rosenberg and R. Jones; cost, $2,986; signed October 19; filed October 23; time, to January 19, 1890; payments, framed, $410; ready for plaster, $468.50; first coat of paint on outside, $550; completed $708; 35 days $750.

SEBASTOPOL.

Frame dwelling. Owner, George Allen; builder, T. O. Coon.

LOS GILICOS.

School house soon to be erected.

SANTA ROSA.

Ludwig's Addition; frame dwelling; $2,000.

The Grand Hotel is being altered and additions made.

Morgan street; two frame dwellings; architect and builder, T. J. Ludwig.

Plans for the Presbyterian Church have been prepared by T. J. Ludwig, architect.

Petaluma road; frame. Owner, J. F. O'Connor; Same locality, frame dwelling and barn; owner, Dr. R. P. Smith; contractor, J. H. Hayden.

GLEN ELLEN.

Frame; owner, W. Gordenkoa; contractor, John Rains.

LIVERMORE.

Tasajera Valley; additions. Owner, S. Williams; contractors, A. Weymouth and John McIver.

Aug. Harms is building an addition to his house and otherwise improving the same. L. M. Lyster is doing the work.

SACRAMENTO.

The Sacramento Foresters are reported to be considering the proposition of erecting a $50,000 hall at an early date.

NOVATO.

J. M. Kill, a Petaluma builder, has taken a contract to construct a Catholic church at Novato. The contract price is $8,200.

GEORGETOWN.

The building of A. A. Francis is having additions and improvements made; also a building by C. Hotchkiss. Several new cottages are being built; carpenters are in demand.

MODESTO.

Corner of F and Tenth streets, a two story brick building. Builder, Curtis. Brown; contractor, W. E. Hook.

SANTA CRUZ.

A. J. Meany of Merced, has been awarded the contract for building the new county jail, cost, $24,884.

PLACERVILLE.

Garden Valley; building. Owner J. W. D. Phillip, lumber on hand.

SAN LEANDRO.

San Joaquin avenue. James Quinn, owner, two cottages about to be erected.

HAYWARDS.

Winton Road, two story residence; owner, John Foster, cost, $3,000.

SAN FRANCISCO, CAL

REVIEWS.

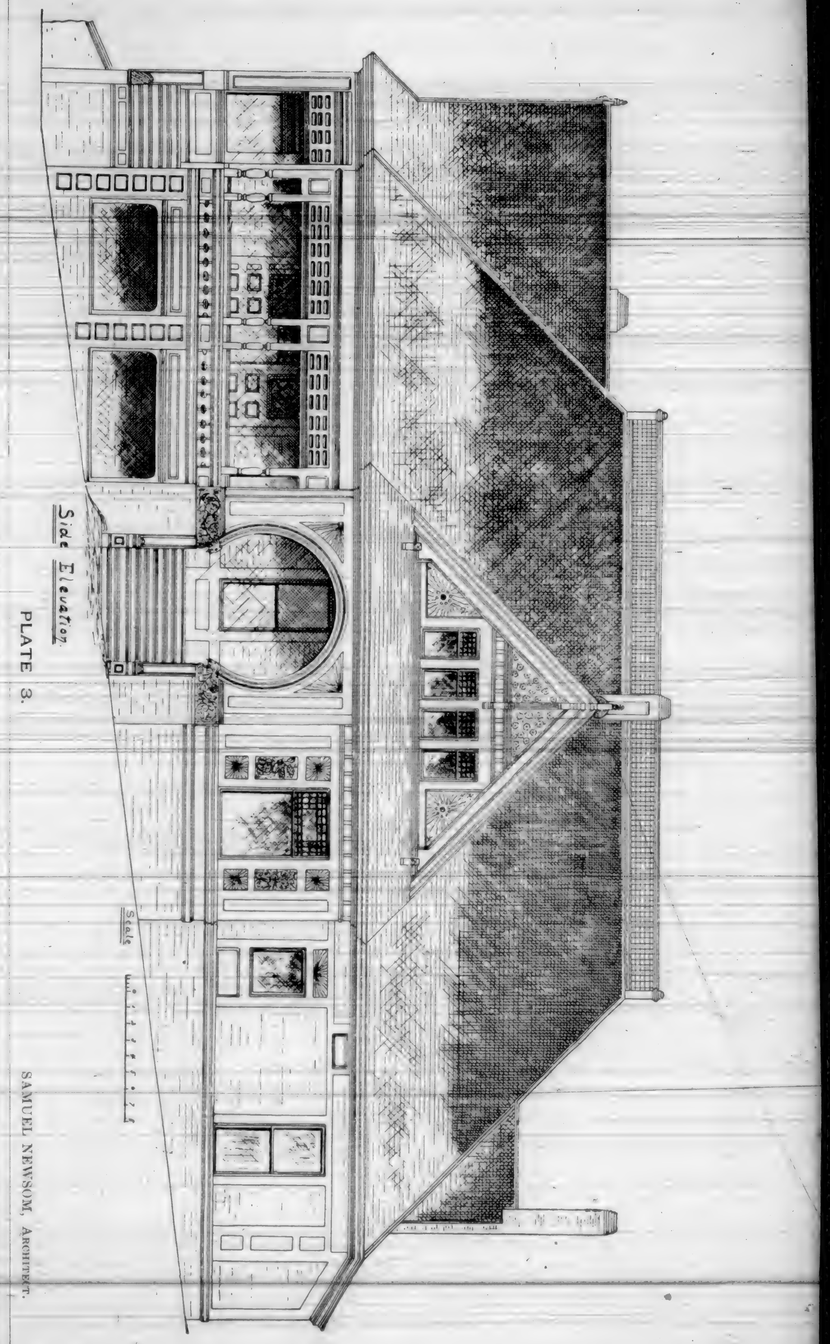
Revista dos Constructores, a journal published at Rio de Janeiro, has been received at this office. It is full of valuable reading and statistics of Brazilian matters.

Cutting & Delaney of Buffalo, N. Y., have recently published an artistically arranged little book entitled "Decorator's Lattice." It is bound in paper covers and is full of valuable information upon the subject of decoration, displaying as its chief feature about one hundred and seventy illustrations of decorative designs, many of which cover the full page. The price is 25 cents.

The *Scientific American* of September 28th gives an account and also a view of the method used at Ocean Grove on the New Jersey Coast for pumping salt water by means of the ocean waves. The contrivance is simple enough, and it is said that 40,000 gallons are pumped daily for street sprinkling purposes. If would only be necessary to increase the pumps and reservoirs to obtain any desired amount of water.

General Specifications of Highway Bridges of Iron and Steel," by J. L. Waddell, Consulting Engineer, Kansas City, Mo., price, 25 cents, is now in its second edition, and somewhat enlarged in size. The object of the pamphlet, as stated by the author, "is to bring about a reform in present methods of designing, letting and manufacturing bridges," but he seems to think that any reformation among country commissioners is almost impossible. To use his own language, "any reform through men who are entirely ignorant of the first principles of bridge building, or even the necessity of perfectly safe structures," can not be expected.

Perspective; "A Series of Elementary Lectures by Ada Cone, late Instructor in Massachusetts State Art School; supervisor of drawing in Concord, N. H., public schools and Lecturer on industrial art to Teachers Institute; Pupil Museum of Fine Arts, Boston. For sale by W. T. Comstock, New York. A 12mo. volume, price $1.00. Sent by mail, free of postage, to any part of the world." The author has improved the opportunity of filling a gap that has long been felt in the line of text books on perspective. It is quite evident from the manner in which the subject is treated that the author has made herself a companion among the students in their desperate struggles to untangle the confused snarls of perspective lines. She has found a way by which all extraneous thoughts and works are pushed aside from the work in hand. Not a letter, line or word in her little treatise that is not necessary, or that can be dispensed with. Her experience seems to have impressed upon her the importance of right words and lines, used sparingly, using only those having a direct bearing on the lesson before her. The work will be found of great value to young teachers who have not had sufficient mathematical training to enable them to grasp the instructions given in many of the text books now in use. The student without the assistance of a teacher will find in it sufficient encouragement to attract him to its study until he shall have mastered the elementary principles, which acquisition will give him a foretaste of its utility and beauty. We commend the work to all who wish to economize in time and labor in the attempt to master the elements of perspective.



Technology Architectural Review—We have had the first numbers of volume two of this excellent journal placed on our table. We cannot speak too highly of it in commending it to the younger members of the fraternity. Each number seems to give the results of first and second "mention" in their monthly competitions, and on plates that are deserving of preservation. It affords us pleasure to quote from their circular.

The *Review* is issued from the Architectural Department of the Massachusetts Institute of Technology eight times a year. Eight numbers constitute a volume. Its size is eleven by fourteen inches; the text is bound with the covers and the illustrations are infolded. The plates are photographic reproductions from original drawings, printed upon very heavy stock. At least four gelatine, or heliogravure plates will accompany each number. The *Review* is protected and mailed flat.

Subscriptions, $3 per volume; to be paid in advance.

Specimen copies, 50 cents each.

CURRENT PUBLICATIONS.

The *Building and Engineering Journal* of Australia and New Zealand for September 7th, contains the following articles: "Australian Building and Bush Work" by Fred Harrison, M. R. V. I. A. "The Source of the Under Ground Water in the Western Districts of N. S. Wales," by H. C. Russell, F. R. S., before the R. S. N. S. W.; also an account of the Royal Institute of Architects' annual dinner, containing much valuable information upon the issue of the day; illustrations. "Proposed Front Elevation of New Zealand and South Seas Exhibition, 1889-90." "Measured drawing of the Treasury Buildings," Hobart Tasmania and "competition drawings for a Village club, by members of the Builders' and Engineers' Designing club." For September 21st: "Some Suggestions for Economical Interior Decorations," by R. Gordan Hyndman, A. R. V. I. A., "Stress Diagrams of Solid Structures," "Study on Unity of Design, in planning New Towns and Suburbs," "The Operation of Power Companies and Power Transmission by Compressed Air; "illustrations a sketch from a colored drawing by Kenwood & Kerle architects, Sydney for a proposed hotel at Wollongong, New South Wales, also a design for a suburban residence by Chas. A. Ogg.

National Builder of Washington for October 12, contains: "Defective Plumbing in Old Houses," by E. J. Hannan. Including October 5th, the illustrations have been notably valuable, namely, Canterbury Cathedral, from the S. E., with towers, and Stratford-on-Avon, showing Guild Hall and Shakespeare's Gramma School.

November 2nd, John Ruskin on "Decorative Art" Illustrations, Outer Court of Trinity College, Cambridge, England.

The Builder and Woodworker for October, contains an article of importance on "Carpentry and Joinery," which has extended through several numbers back; chapter X has for its subject, "Battening and Grounding." For November, among the illustrations, first prize design, SchoolHouse Competition, by the New York State Educational Department.

The Woodworker for October, publishes several articles of value. "Theory and Practice as Applied to Mechanics," by Mr. C. R. Tomkins, M. E., "Building and Repairing," by Mr J. T. Langdon, and "Factory Fires" by Mr. George Fisher.

Building for October 12th, contains the following: "Sun Dried Bricks," by E. A. Gardner: "Mill Flooring," and an "Account of the Convention of the Western New York State Association." Illustrations, design of New York State club, in competition, subject, "A Well House in the Country," by Mr. C. H. Dash; competition drawings of the Building Sketch Club (third competition) subject, "Pair of Semi-Detached Houses on Suburban Lot," by W. S. Aldrich, of Portland, Me.; for October 19th, "Disasterous Effect of Spontaneous Combustion," "Steam Plants, for Isolated Electric Light Plants," "Change of Internal Structure in Iron," and "Artistic Use of the Imagination." Among the illustrations, design for residence in Building Sketch Club competition, by "Jersey Lightning" William H. Orchard, Rochester New York. For October 26th, "Criminal Court Plans" "Forest Fires," "Experiments Upon the Transmission of Power by Compressed Air, in Paris" by Mr. Alexander B. W. Kennedy, F. R. S., before the Mechanical Science Section of the British Association at New Castle, September 11th. Among the illustrations competitive design for semi-detached houses, on a suburban lot, by John W. Lees, St. Louis, Mo., showing perspective elevation and plans. November 2nd, Sir Christopher Wren and his architecture from a lecture by Prof J. Rogers Smith University College London.

The American Architect for October 5th contains the following: "Berlin Dwelling Houses," "The Problems of Concentrated Residences," "The Theory of mouldings and old Colonial Work of Virgina and and Maryland." Illustrations: competitive design for the Cathedral of St. John, the Divine New York, by Messrs. Carrere and Hastings, architects. Also designs for same by F. P. Chandler, architect, and W. S. Fraser, architect This competition has brought forth remarkable drawings. For October 12th, "The Restoration of the Ducal Palace, Venice," "London's water supply," "The Grant Monument Competition" and "Equestrian Monuments." For October 19th, "Safe Buildings," "Letters" from Canada, Australia, Paris, Washington and Chicago. Illustration, competitive design for cathedral of St. John the Divine, New York, by R. W. Gibson, architect, also by Messrs. Cope & Stewardson and Peabody & Stearns. October 26th, "Equestrian Monuments" (Joan of Arc,) designs for the Hinkle gold medal. November 2d, "Jean Paul Aube," "The Responsibility of Architects," "Baths for the People,". Notes on competitive designs for the Cathedral of St. John the Divine. Illustrations for which are furnished by H. M. Congdon, architect, New York.

The Inland Architect for October contains articles upon the following subjects: "The Art Exhibition at the Chicago Exposition, Notes and observations" by H. C. Payne; "The Artistic Use of the Imagination," by Louis H. Sullivan, architect; "How shall we Build," by J. C. Yost, architect; "Sketching on the Continent," and "Rules and Regulations Governing the Drainage and Plumbing of New Buildings in Chicago;" For illustrations: "Ranch House" by Wilson, Marble & Lampson, architects; Chicago, Illinois, residence at Rochester, New York by Otto Block, Architect; St. Louis residence by C. C. Helmer, architect; Trinity Episcopal Church, Michigan City, Indiana, by Henry F. Starbuck, architect; Chicago Tenement Block, by G. W. and F. D. Orff, architects; Minneapolis, Minn. Country Residence, Grape Creek, Illinois, by Irving K. and Allen L. Pond, architects; Chicago, Illinois, thirteen story office building by J. M. Van Osdel & Co., architects; and an office building by Mason & Rice, architects, Detroit.

The Sanitary News for October 19th contains articles upon "Management of Garbage in Large Cities," "Household Sanitation," and "Purification of Sewage by Electrolosis," giving a synopsis of a paper upon that subject read by W. Webber before the British Association, demonstrating the destructive power of electricity upon sewage matter. October 26th, "Steam Plant for Isolated Electric Light Plants," by Prof. J. W. Sweet of Rochester City, before the Convention of the State Association of Architects at Syracuse, N. Y.

Scientific American for October contains designs of the memorial monument of the battle of Langside, A. Skirring, architect; Winn Memorial Public Library Massachusetts, H. H. Richardson, architect; New Court House and Post Office, New Bedford, Massachusetts. The Mexican Pavilion at the Paris Exhibition and the Fitzwilliam Museum, classic design, Cambridge, by George Basier, architect; November, "Cathedral of Seville," with illustration; "Strength of Stone Masonry" by Prof. I. O. Baker, Illinois in *Stone* and "The Amines Process of Sewage Purification," from *Iron*. Among the illustrations; New Post Office and Court House, Asheville, N. C Christ Church, East Orange, N. Y.

The Western Architect of Denver presents a special edition for October with an increased number of designs handsomely produced. Contents: "Removal of Garbage," "Arches," by Mr. Ben Pitman, "Architecture of New Mexico," by Alexeris Comparet, "Asphalt" and "Asphalt Again," from a Paris correspondent. Illustrations: Some Denver Doorways, viz I, Masonic Temple; II, Denver High School: III, Trinity Church: IV, Kittridge Building; V, Church at Santa Cruz, (three hundred years old) and a Denver residence by R. S. Roeschlaub, architect.

The Engineering and Building Record for October 5th contains a continued article on "Pavements and Street Railroads," illustrations perspectives, plans and erections, pumping station, Wakefield R. I. Water Works, William Kent, architect; Woonsocket, R. I. for October 12th an exhaustive and valuable article on the "Forth Bridge," illustrated by Benjamin Baker, (abstract of an address before the British Association,) also article on the "Removal of Rock under Water without Explosives" by Fred Lobnitz, Associate M. Institute C. E; October 19th, presents a brilliant scarlet cover quite a contrast to its pale-faced contemporaries with an increased number of pages and containing "Electric Light Wire Problem in New York," "Thames River Bridge," and "Kanawha River Bridge," and the "Water Supply for the Paris Exposition." For October 26th, "Manchester Ship Canal," "Inspection of Cements," by F. Collingwood, Mem. Am. Society C. E., and "Sewerage and Land Drainage." For November 2d, "The Girard Hydraulic Railway Exhibited at the Paris Exposition." Explaining the method af propulsion and its adaptability to common usage. Diagram and statistics for proposed English Channel Bridge and "Building Construction Details," (Machinery Hall Paris.)

Carpentry and Building for October presents "Effects of Time on Slack Lime" by M. Faraday; "Masonry" (continued from July); an extensive correspondence from all over the country, and an extended criticism on "Graphics, or the Art of Calculation by Drawing Lines, Applied Especially to Mechanical Engineering," by Robert H. Smith.

The Northwestern Architect for October contains "Venetian Glassmakers" and "Stained Glass," from *Le Semaine des Constructeurs*, and "Building Stones of the Northwest." Among the illustrations is the residence of S. C. Gale, Minneapolis, L. S. Buffington, architect.

American Builder, Nov. 15, contains "Joints and Fastenings in Carpentry" and an article on "Masonry."

Journal of Proceedings, October 24, contains "Presidential Address of Mr. T. Mellard Reade, F. G. S., before the Liverpool Society, subject, 'Architecture, Ancient and Modern;'" "Scottish Architecture," by J. Alfred Gotch; "The Building of Blenheim," by Wyat Papworth, and Mr. Leonard Stoker's address before the Architectural Association, a paper filled with interesting matter for the profession.

Brickmaker for November: "Aluminum Street Paving Bricks;" 'Brick Burning with Coal Fuel."

BUILDING-LOAN NEWS.

Under this heading we propose from time to time to give some facts regarding these associations which are doing so much towards making homes for our people. Considerable attention is being directed at present to the new institutions being started in other parts of the country calling themselves "Nationals," "Americans," or some other over-spreading name, and inviting investments in their shares from every section. Our advice to our readers is to go "slow". The promises which these associations make are encouraging, and the temptation to invest is strong, but, let us stop and think awhile before sending the money to Minnesota or New York to be invested by strangers in strange ways. We say strangers, because we are advocating the support of local institutions, where the money is loaned by those we know, *to* those we know, and upon property we can see and value *ourselves* any day. There is no myth or mystery in any respect about our home societies! In this issue we shall only mention a few of our local societies and give their assets at date of their last loan statements, viz:

HOME SEC.,	Oakland,	incorp'd	1875,	loans & other assets,	$433,303
Union - -	S. Fran.,	"	1881,	" " "	351,304
Occidental - -	"	"	1885,	" " "	315,064
Citizens' - -	"	"	1885,	" " "	242,706
Homest'd L'n.	Berkeley,	"	1885,	" " "	110,047
Home Mut.,	S. Fran.,	"	1885,	" " "	89,188
Commercial,	"	"	1886,	" " "	44,533
W. Oakland,	Oakland,	"	1875,	" " "	186,940
S. F. Mut L'n,	S. Fran.,	"	1882,	" " "	393,717
Ital. & Swiss,	"	"	1887,	" " "	76,769
S. F. & Oak.,	"	"	18 9,	" " "	26,967

"The average number of shareholders in an association who are able to procure loans is found to be about one in four. Complaints frequently reach us that agents of certain national associations have represented that the number of shareholders who will receive loans is much larger than this. In fact, they are said to hold out to every subscriber the hope of obtaining a loan. We are satisfied ourselves, that their representations are not authorized. * * * * They use too much rose color in painting the prospects to new members."—*Building and Loan News.*

There are about sixty local associations in New York City, and say, forty in Brooklyn.

Ohio has organized a Building Association League, and California will follow her example in the coming spring.

New Hampshire has enacted the following amendment to Chapter 93, Laws of 1887: Section 1—Every building and loan association shall pay annually a tax of one per cent upon the whole amount paid upon its stock of shares which are in force, and no other tax shall be assessed on said stock or shares or against the holders on account thereof. Section 2 — Building and loan associations shall be under the supervision of the bank commissioners.

E. B. Rambo, president of the Citizens Building Loan in an article published with the secretary's quarterly report of that society makes this statement regarding the so-called "Nationals" Of all dues paid in, *twenty cents* with each dollar, or 16⅔ per cent, likewise, goes to their officers for *expenses*. Thus an enormous fund is collected for the benefit of these gentlemen, not the member's property at all. Had our Association collected such sums, a fund of over $50,000 would have been distributed to officers only."

A preliminary meeting of The League of General Building and Loan Associations of the United States was held at Chicago July 25th, E. Summers was chosen secretary *pro tem*. Articles of Association were adopted, officers elected, and committees appointed to serve until November 13th, when a permanent organization will be effected. The following are the officers elected:

M. D. Miller, St. Paul, Minn., president; J. V. Ryan, Memphis, Tenn., vice president; Owen Scott, Bloomington, Ill., secretary; T. J. Bunn, Bloomington, Ill., treasurer. The associations represented may be stated thus—three "Americans" two "Interstates"—two "Nationals"—one "International"—and one "North American". The secretary was instructed to communicate with those not present and urge their attendance on November 13th.

Lumber delivered on board cars will be charged $1 per M extra. Lumber delivered along side of vessel or wharf, 50 cents per M extra. Scale of credit not to exceed 60 days without interest being added.

Tongued and grooved beaded on two sides $2 50 extra.

The contract for the construction of the Colorado Mineral Palace at Pueblo, Colorado, has been awarded. The architecture will be Egyptian in style. The building will cost over $250,000, and will be one of the largest and handsomest in the West. It will be devoted to a permanent exhibit of gems and mineral specimens, not only from the mines of Colorado, but from all over the world.

The Board of Supervisors of Santa Rosa have resolved to build a $40,000 jail.

With this number a change is made in the form of the *Building News*, by the addition of a *Trade Review*. This department, in time, will be enlarged upon, as well as other features of the journal.

Has Architecture a Name? 158

Mr. George H. Wolfe, having no further connection with the business of this journal, correspondents will in future address their communications to the *California Architect and Building News*, 408 California street, San Francisco, Cal.

THE regular monthly meeting of the San Francisco Chapter, A. I. A., was held Friday evening, December 13th. The members present were Messrs. Babson, Sanders, Curtis, Percy, Pissis, Mau, Cuthbertson, Whittemore, Daley, Bestor and Everett.

Architects Farrell, of Tacoma, Bugbee and Capelletti of this city were present as guests, besides Messrs. Gilbert, senior and junior of Woodland, Blum, Wetmore and other gentlemen interested in the subject of the paper to be read.

An offer of the *California Architect and Building News*, to donate to the Chapter such of the exchanges of the past year as it might select to have bound, the volumes to become a part of the Chapter's library, was received and accepted.

Mr. Shimoda read an interesting paper on the "Architecture of Japan," past and present, tracing its growth from the earliest ages. Many carefully drawn designs and photographs of Japanese buildings were shown to the appreciative audience.

Mr. Shimoda was tendered the thanks of the meeting.

Mr. Sanders stated that the members of the class under his instructions were preparing original designs of a simple subject, to show their skill in treating it, and suggested that the Chapter encourage their exertions by offering a prize for the best design, and an honorable mention for the second. The suggestion was acted on favorably.

The Executive Committee was instructed to make arrangements for the first annual banquet to be given under the auspices of the Chapter.

The meeting then adjourned.

WE publish in the present number President Carlin's annual address before the Western Association of Architects, and President's Hunt's, before the American Institute of Architects. These addresses should be read attentively by every Architect in the country.

The position these gentlemen occupy, in relation to the profession, enable them to speak intelligently in regard to matters most vital for the advancement of the influence and professional standing of members of the profession.

CAPT. A. H. NICHOLS, of the American ship St. Mark, died at the receiving hospital on November 28th ult., from injuries received from falling into the basement of the building now in course of erection on the corner of Park and City Hall Avenues, the contractor having neglected to enclose the building with a fence as required by the city ordinance. One dark evening, Capt. Nichols, while walking past this place, was unfortunate enough to fall into the unguarded excavation, and was so seriously injured that he died the next day as above.

In another column we chronicle a decision by the Supreme Court awarding damages for injuries received under somewhat similar circumstances. We do not know of any adequate compensation that the courts could award for loss of life. But we do know that we have laws, which if *enforced* would prevent such accidents, and officials whom we pay *to see that the same are enforced*. It seems to us that the officer whose duty it was in this instance to see the law properly carried out should be found, and discharged for incompetency, if not otherwise punished for derelection of duty.

THE Fire Department Committee of the Board of Supervisors has made a serious mistake in deciding not to recommend an extension of the fire limits. The reason alleged is that the lots on Minna, Jessie, Everett, Natoma, and other small streets within the proposed boundaries, are mostly owned by poor people, and that it would be unjust to compel them to put up brick or stone buildings. The extension would not have interferred with any buildings already in existence. Nobody would have been compelled to tear down his home and put up a fireproof one in its place. The effect of the order would have been merely to prevent the construction of any more wooden houses in the future.

Chief Scannell was right when he said that there should be a hundred blocks instead of forty in the new map, and that the refusal to extend the limits would be responsible some day for a fire that would wipe the whole southern part of the city out of existence. The poor people there are more interested than any other class in the community in preventing such a calamity, for they are the least able to bear the loss. And aside from that the whole city has rights which even poverty must respect. Public safety is the first consideration, and whether a man be poor or rich he must contrive to accommodate himself to that. It may be that we shall need a Chicago fire to teach us that a great city cannot afford to risk its existence to save a few lot-

owners the difference in cost between wood and brick, but when it comes, the new San Francisco that will rise from the ashes will have mastered the lesson.

The Fire Department Committee should reconsider its action. At least it should give the public what it offered to give Chief Scannell. The Chief, with natural impatience, refused to accept any further deductions from his original plan, but the people would rather have some protection than none.

The above, from the *Examiner*, takes the precise view of the case that we set forth in our last number. Since then Boston has suffered a loss of 10,000,000 by fire, and her neighbor, Lynn, has lost its business center from the same cause. San Francisco's turn has not yet come, but when it does we may desire to follow the advice given many years ago by *Frederick Law Olmstead*, who, in a report to the Committee on Outside Lands of the Board of Supervisors, had the foresight to recommend the city be divided into sections separated by broad boulevards, from 500 to 1000 feet in width. Though we did not adopt the sensible suggestions made by *Mr. Olmstead*, it is not too late to urge upon all growing cities and towns the wisdom of thus protecting themselves against the spread of a conflagration. By proper selection and planting of trees and the larger shrubbery, these wide streets or avenues become beautiful driveway sand parks for the comfort and enjoyment of citizens, and add much more than their cost to the beauty and attractiveness of the city so adorned.

PIECE WORK.

San Francisco, Dec. 6th, 1889.

To the Editor of the California Architect and Building News:

Dear Sir.—We, the members of Union 22 of Brotherhood of Carpenters and Joiners of America, desire to present for your consideration certain facts pertaining to *subletting* of carpenter work or *piece work* as it is called. From long experience we have attained a knowledge of the injustice and injury this practice causes to all parties concerned. We ask an opportunity to bring this matter directly before those most interested, viz.: the architects, owners and reputable contractors. It may not be generally known that there is a class of men, calling themselves carpenters, who are unprincipled, and unskilled, who are unable to do a good day's work, and consequently unable to obtain steady employment at regular wages. These men resort to piece work for a living, depending on their ability to slight work to make up for their lack of skill. Their methods are various, and we will describe them more fully if you will grant us the opportunity. We are happy to say that the better class of contractors do not as a rule find it to their interest to employ these incompetent mechanics.

Hoping you may be able to assist us in this fight for better work, we remain,

Yours respectfully,

Union 22,
Brotherhood of Carpenters of America.

We understand this matter has been brought before the Builders Association of California, and a communication on the same subject sent to the San Francisco chapter of the American Institute of Architects. The matter is one of considerable importance to architects and owners as well as the carpenters, and we shall be pleased to do anything in our power to expose the slipshod methods of work shown by this communication to exist.—Ed.]

PLANS FOR THE MECHANICS' INSTITUTE.

At the last meeting of the Directors of the Mechanics' Institute, two reports were submitted on the advisability of permanently improving their property bounded by Hayes, Larkin, Grove and Polk Streets.

The report signed by David Farquharson recommended the erection, where the Pavilion now stands, of a Library building entirely detached from all stores, devoted exclusively to the use of the Library, and that the property on Hayes Street be leased on graduated building leases for twenty years.

President Kerr recommended the construction of a four-story fire-proof building on Hayes Street, with stores for business purposes on the first floor, rooms for the Library on the second, reading and chess rooms and lecture halls on the third, and class rooms, etc., on the fourth floor. Either of the proposed improvements would cost in the neighborhood of five hundred thousand dollars.

It is probable that Architects will be invited to submit plans in competition, as Mr. Farquharson recommended offering the sum of five thousand dollars in premiums for sketch designs.

MR. R. M. HUNT'S ADDRESS.

before the American Institute of Architects.

Fellows and Associates of the A. I. A.:

Thirty-two years ago a few architects convened in the city of New York for the purpose of considering the expediency of organizing a professional society, the object of which, as set forth in the constitution, was to unite in fellowship the architects of this continent and to combine their efforts so as to properly promote the artistic, scientific and practical efficiency of the profession. This resulted in a constitution adopted in February, 1857, and incorporated in March of the same year, as the American Institute of Architects. The continual and rapid growth of the requirements of civilization, the immense distance between the great business centers of the East and West, made it advisable to establish Chapters as integral portions of the Institute, and in order to compensate for these and other difficulties, the federal system of local organizations was adopted in 1867 as the best method of reaching directly the necessities of the profession throughout the country.

To-day, when the Twenty-third Convention of the American Institute of Architects meets at Cincinnati, the full force of the original intention of the founders is impressive with a great significance. The Institute and its younger brother, the Western Association, stretch out their hands in fraternal greeting, as they meet to effect the unification of the two great architectural associations of the United States and to consider the carefully prepared report of the special committee on consolidation, which has been published in advance, that each member present might bring the result of his deliberations to bear upon the discussion of the best method to accomplish the end in view.

The Institute depends upon the Chapters for its very life blood, and could not exist any more than the body without its members, if the Chapters were not alive and active. Chapters should therefore be strong in membership and earnest in work, perfecting every suggestion for the advancement of the profession, considering and futhering all educational and helpful methods, and bringing to the conventions of the Institute all matters accomplished and under consideration that may be of interest to the profession at large.

The practicing architect, from the very diversity of his duties and requirements, gains largely by constant intercourse with his confrères. The interchange of ideas and personal experience are of inestimable benefit to him, and consequently to his clients; in fact, it should be the self-protective duty of every architect to belong to one of the Chapters. I would here suggest that too often young men, fresh from study, in the fire of ambitious enthusiasm, but yet untaught by stern lessons of experience, are eager to establish new leagues, associations, societies and clubs, rather than affiliate with established institutions, and reap the profit of proved effort.

A little reflection would teach them that the older institutions have formulated those rules and regulations, those principles of art and practice, which have elevated the profession in America to its present honorable standing. That through the insistent and persistent course of the Institute, for the rights, for the dignity, and for the position of architecture as a fine art, so long ignored in this country, they have through precedents created for them, been spared some fierce contests.

Let them rather profit by the paternal care of the Institute, as their advisor and advocate, stretching forth with the strength and vigor of new inspirations to reach the ideals of its standards, taking for their underlying principle mutual assistance and coöperation in the more familiar intercourse of the Chapters.

The report of the Special Committee on Consolidation is so wisely considered and so admirably expressed that it leaves nothing for me to say, beyond words of commendation, and to impress upon you that the earnest efforts of these gentlemen in thus providing for the merging of the two great architectural associations of our country into a common Institute is not a funeral dirge to "ring out the old and ring in the new," but a refrain, ancient as history, and strong as truth, "Union is force."

PRESIDENT CARLIN'S ADDRESS BEFORE THE WESTERN ASSOCIATION OF ARCHITECTS.

Gentlemen of the Western Association of Architects:

The position in which I find myself placed by your votes of one year ago has, among its other duties, laid upon me the responsibility of addressing you to-day,—a duty which I approach with mingled feelings of pride and regret. When I think of the standing and dignity of my predecessors, a feeling of great timidity, in venturing upon the task, tempers whatever pride and enthusiasm I might have entertained, and I feel entirely unable to say what would be the most fitting words on this occasion.

I do not need to tell you that this is the last meeting of the Western Association of Architects in its present form, or to rehearse to you the causes which have contributed to the movement of which this convention is the culmination. The origin of the two bodies which meet here to-day to complete the consolidation of their interests and future usefulness, as well as the good work which they have accomplished, are matters of history, and familiar to nearly all of their members.

The work of the joint committee, composed of members from both bodies, is represented by the draft of the Constitution and By-Laws which has been accepted by the letter ballot, and which will come up for discussion and amendment before its final adoption. Although it has been thought advisable to retain the name and continue the corporate existence of the American Institute of Architects, which is known and respected in every civilized country of the globe, it has also been thought best to radically change the methods of conducting the business, and to borrow largely from the Constitution and By-Laws of the Western Association. The strictly democratic form of government which has been so successfully demonstrated in the latter, has been retained, and the new Association will be formed on an even basis, and absolutely with but one grade of membership, except that natural leveling which does not depend on the votes of any board or body, and which is free and open to all.

Neither has it been deemed advisable to provide for any system of representation, but rather to throw open the doors of our conventions to all members, on an even footing, having every one who does attend, feel that as far as to his vote and right to be heard, he is the peer to any one present, thus stimulating and encouraging the attendance instead of the reverse; and it is in a great measure to the interest felt in the attendance of our annual meetings that our influence for good in the future is to come, for we must make membership seem valuable to the average architect, or he will not desire or consummate it, and our strength lies largely in numbers and in spreading our influence over as large an area, and into as many localities and offices as possible, while the annual conventions and standard of membership should by all means be kept up to the highest point of interest and usefulness.

But it is not to the annual conventions that we must look for the greatest results of the Association in the future. For some portions we must look to the City and State Associations, who can organize and carry onward their work in the several branches, using the annual convention as a place for renewing old friendships and making new acquaintances, for viewing the works of our confreres under most favorable circumstances, but mainly for the reception of reports from the various local organizations, and for discussing and mapping out the line of policy to be pursued for the coming year.

Although we have done good work in the past, there is much that remains to be done to place architecture where it rightly belongs,—at the head of all learned and scientific professions,—and to bring it before the public in its proper light. This can only be obtained through a proper education, first of ourselves, second of the general public. We need to cultivate our relations with each other, and to establish a code of professional ethics which shall embrace the proper relations to be established, not only between the architects who may have business dealings together, but also between the architect and client, and which shall partake of a legal statute, in so far as the duties and responsibilities of an architect extends when engaged in carrying out the orders and ideas of his employers, as to what should be expected of him in the discharge of his duties as expressed in our schedules. There is a fruitful field before us in this direction, and one which should claim our best efforts and attention.

We have before us, in the line of improving, the present system of designing our government buildings, and in this we cannot hope to accomplish the needed reform until we are able to impress upon the public mind some of the principles which should govern the carrying out of such undertakings, and bring those in authority to see the manifest advantages which would be the result of placing the designing of buildings intended for different portions of the country, and covering the widest range of materials and uses, in the hands of professional men who are constantly dealing with the same factors and conditions in their every-day work.

We should have a better understanding on the subject of competitions, and in this need the public should be brought to see the matter in a different light than the one generally accepted. In other words, we must respect ourselves, before we can expect others to respect us.

A great deal might be said in favor of a bureau of legal intelligence, which should include the best attainable talent, to be retained as a sort of district attorney for the whole association, to assist in defining and establishing the rights of the members who most stood in need of such service, and should also include the collecting and compiling of all matters of legal record pertaining to building interests; and the value of such an adjunct becomes apparent when we attempt to find a legal authority who is at all familiar with such matters.

This much of our work, and many other subjects which might be brought forward, must, if undertaken at all, be done by the National Association. The variots State Associations will each have their individual interests to foster and improve, and it is largely through these that we must look for improvement in the matters of legislation. Especially will this be true of the measures designed to legalize and license the practice of the profession. One of the principal difficulties to be encountered in this direction is the fact that the general public, even including our lawyers, legislators, and members of other professions, have never given any thought to the matter, or, at most, have supposed that there was some sort of law or regulation on the subject. The investigation of the subject in the State of New York has developed the fact that the matter only needs to be brought to the attention of our public men, and before the press, to receive their hearty and unqualified endorsement and support, and it is considered probable that such a bill will be passed by the next Legislature. If every State Association will accomplish this result, it will have justified its existence.

There are other reforms (if I may be allowed the expression) which we, as a profession, stand in need of. We need better methods of testing the various materials and appliances of which our buildings are composed, and one whose endorsement should mean something more than those with which we are usually flooded, and which should stand for the professional brother a. the word or letter from a well-known authority on the subjects We also need a better plan of education for our draughtsmen than that which is within the reach of the average student in an architect's office. It is of infinitely more importance that they should be able to detail a window frame or other portion of a building in such manner as to admit of its proper construction and service, as that they could correctly compute the quantities and dimensions of a building and make complete bills of material, than that they should design a Greek god in solid bronze (made of galvanized iron) to adorn the facade of a city front, or that they should be able to construct (on paper) some of those wonderful creations which are intended to be perpetuated for all time in hemlock scantlings and shingles.

It is to the work of city Associations and individual members of the profession that we must look for the initiative in this direction. There is much which can be done by concert of action, through local committees, lectures, readings, etc., similar to the law schools which have been established in some of our cities, but the greatest field open to us in accomplishing the desired reforms, is through the medium of the press. We, as a profession, do not write and talk about the subjects with which we are most familiar. An interesting article can always be written by a person who has given his subject much thought and investigation. When the physician, chemist, or other professional student

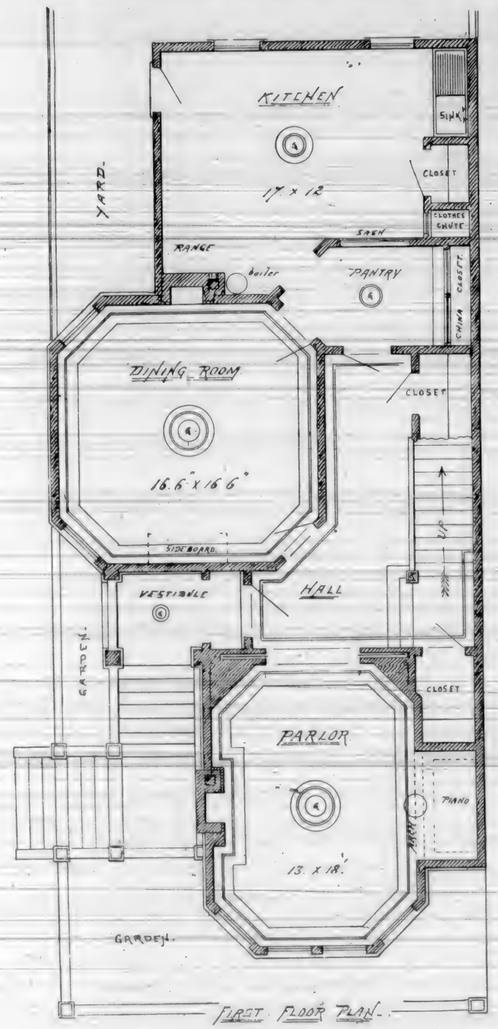

Plate No. 1.

makes an important discovery, or comes across anything unusual in the course of his daily practice, he at once either writes the matter up for the journals, or makes it the subject of a lecture before a class of students.

When we think that there is no more interesting subject to the average citizen than that of a building, and that outside of the publication of the exteriors and occasional plans of important or interesting buildings, often accompanied by a description written by a reporter, whose knowledge of the subject was confined to "splendid proportions", "stately magnificence", and kindred phrases, how little we are able to read on the subject that treats of the work of to-day.

Why should we not have lecture courses for the improvement of general knowledge on the subject, and to which the draughtsmen of the various localities should be especially invited, as well or better than many of the similar entertainments, so-called, with which the halls of our cities are filled. We must take the initiative in this matter if anything is to be accomplished, and not only throhgh the committees which may be appointed, but also through the individual work of members, either working singly or in groups, self-appointed, to carry the good work forward to a successful termination. The time and energy so spent cannot be counted lost, even though the results are not immediately apparent. The recluse who shuts himself up with his work and his books, or the man who devotes his whole thought and attention to his own special work without paying attention to what is being done around him, can never hope to attain the eminence of the man who constantly circulates among his fellows in the same line, who is as ready to give as to receive a good suggestion, for it is an additional fact that the teacher is as much benefitted as the pupil. Much more might be said in support of the theory, but this paper has already far exceeded the limits laid down.

We know that there are many among you who have thought it unwise to consummate the union between the two bodies about to be joined in wedlock, but thought that this Association was sufficient unto itself; although holding these opinions, were willing to be governed by the majority, and lend all possible assistance to the success of the plan if adopted. It is earnestly hoped that the step which has been taken will never be regretted by any of you. If the same earnestness and vigor which has characterized your work in this Association be carried forward and made a part of the new institution, The Western Association of Architects has justified its comparatively brief existence.

The American Institute of Architects, which is to be formed to-day from the members of the former bodies, is coming into existence under most auspicious circumstances, representing as it does a county rich in possibilities; in prosperous circumstances; at peace with all the world; just awakening to the fact that its cities need rebuilding on a better plan, and with more enduring materials and increased facilities for comfort and usefulness; about welcoming to its shores the representatives of all nations to inspect a World's Fair, which will, without doubt, surpass in extent and magnificence any previous undertaking, and which will be located at Buffalo, half way between New York and Chicago. The future of this Association none can fortell; it is the largest and most powerful body of architects on the face of the globe; its sphere of usefulness unlimited. It seems possible for it to mould the future of the profession in this country like a mass of clay, and by taking advantage of the opportunities before it, and by profiting by the experiences of the past, the architects of the next decade might be said to have the world at their feet. —*From the Building Budget.*

THE CONSOLIDATION CONVENTION AT CINCINNATI.

The consolidation of the W. A. A. with the A. I. A. was consumated on the 20th of November, Richard M. Hunt acting temporary Chairman. On the 21st the following named officers were elected. (*From the American Architect and Building News.*)

President, Richard M. Hunt, of New York; *First Vice-president*, W. W. Carlin, of Buffalo; *Second Vice-president*, J. W. McLaughlin, of Cincinnati; *Secretary*, John W. Root, of Chicago; *Treasurer*, S. A. Treat, of Chicago.

Directors for three years: Edward H. Kendall, of New York; Chas. A. Cummings, of Boston; Dankmar Adler, of Chicago; Henry Van Brunt, of Kansas City; Jas G. Cutler, of Rochester; C. E. Illsley, of St. Louis; E. T. Littell, of New York; Jas. H. Windrim, of Philadelphia.

Directors for two years: R. S. Peabody, of Boston; R. W. Gibson, of New York; W. W. Clay, of Chicago; Stanford White, of New York; C. A. Coolidge, of Boston; W. H. Hayes, of Minneapolis; O. P. Hatfield, of New York; W. R. Briggs, of Bridgeport.

Directors for one year: T. P. Chandler, of Philadelphia; Adolf Cluss, of Washington; J. C. Stevens, of Portland; C. F. Schweinfurth, of Cleveland; Sydney Smith, of Omaha; G. W. Lloyd, of Detroit; W. C. Smith, of Nashville; A. C. Bruce, of Atlanta.

Building Supplement and Trade Reviews.

VOLUME 10. DECEMBER 15, 1889. NUMBER 12.

ANNUAL BUILDING SUMMARY.

In the following table we present the number and value of buildings erected in San Francisco during the year about to close:

FOR FIRST SIX MONTHS.

	No.	Frame Buildings Value.	No.	Brick Buildings Value.	No.	Additions & Repairs Value.	Total No.	Total Cost.
January	47	$195,199	2	$ 76,020	23	$163,361	72	$434,580
February	53	233,065	5	271,831	9	27,642	67	532,538
March	68	308,936	2	119,403	12	24,465	82	452,804
April	77	345,967	5	112,818	15	53,225	97	512,010
May	96	396,172	2	193,457	21	58,855	113	648,484
June	78	557,435	2	36,210	29	54,726	108	648,371
Total	413	$2,036,774	18	$809,739	109	$382,274	540	$3,228,787

FOR SECOND SIX MONTHS.

	No.	Frame Buildings Value.	No.	Brick Buildings Value.	No.	Additions & Repairs Value.	Total No.	Total Cost.
July	82	$389,788	4	$168,235	43	$186,936	129	$744,959
August	88	473,592	3	94,770	17	82,337	108	650,699
September	63	306,003	3	228,815	7	20,977	73	555,795
October	91	446,892	4	381,710	8	13,592	103	842,194
November	71	359,345	1	32,300	12	45,774	84	437,419
December	33	182,247	3	297,760	8	23,965	44	503,972
Total	428	$2,157,867	18	$1,203,590	95	$373,581	541	$3,735,038
Grand Total	841	$4,194,641	36	$2,073,329	204	$755,855	1,081	$6,963,825

This statement has been made up from the files of the Architect and we should bear in mind that in addition to this, there must have been many improvements not noted through the records. We should estimate such improvements at not less than $500,000 in the whole city, making a grand total of say, $7,5000,000 for the year, being in excess of even 1885 in the value, though far behind in the number of the buildings.

We will give the total values and numbers from 1880 so that our readers may make a comparison:

1880—	397	engagements, value	$1,754,435
1881—	533	" "	3,790,732
1882—	785	" "	3,896,212
1883—	803	" "	5,261,689
1884—1,127		" "	6,202,807
1885—1,457		" "	7,043,999
1886—1,148		" "	6,401,669
1887—1,093		" "	6,605,054
1888—	891	" "	6,244,220

NOTICE TO CONTRACTORS.

Sealed proposals will be received at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 16th day of January, 1890, for all the labor and materials required to construct and complete the wharf, boat-house, barracks, hospital, disinfecting apparatus, etc., for the United States Quarantine Station, Angel Island, San Francisco, Cal., in accordance with the drawings and specifications, copies of which may be had on application at this office and the office of Surgeon P. H. Bailhache, United States Marine Hospital Service, San Francisco, Cal. Each bid must be accompanied by a certified check for $500.

The Department will reject all bids received after the time fixed for opening the same; also, bids which do not comply strictly with all the requirements of this invitation.

Jas. H. Windrim,
Supervising Architect.

December 5, 1889.

REVIEWS.

N. W. Ayers & Sons' American Newpaper Annual for 1889 has been laid upon our table full of a carefully prepared list of all newspapers and periodicals published in the United States and Canada.

It enumerates the various press and editorial associations and their officers, contains a list of all newspapers inserting advertisements, and a complete list of all the religious, agricultural, medical, commercial, scientific, educational, and other class publications.

It gives the population of every state, territory, county and county-seat, city and town, it gives the number of votes polled in each state, territory and county by either of the parties, and on the whole is an exhaustive work worth every dime of its cost to any advertiser of note, and full of valuable information to all. Price $5.00, carriage paid.

WOODLAND.

Tenth Annual Report of Building and Improvements in Woodland and Yolo County, summarizing the kind, number and cost of the various structures for the last twelve months, as furnished the "Architect," by Gilbert & Sons of Woodland.

1888	134	392,355	2,928	50,000	14
Total	1,023	$2,483,685	$2,423		

The architects, contractors and all interested in the building trade are invited to send building information from the section of the country they represent. We report all the recorded building news of San Francisco and Alameda counties, and for the future intend to make a thorough report from every town on the coast and interior. The index for 1889 will be out in January.

Binders for temporary use can be obtained at this office, not only for the CALIFORNIA ARCHITECT, but any other journal. For prices see our advertisement on page XI.

Our book trade is enormous. Order through us.

tion to this journal for one year, if sent direct to this office, will entitle the subscriber to a rebate of $1.00 on any one of these works.

ANY book not on above list we can supply at regular rates.

A perfect model of the "Monarch" Bear has been presented to our Editor by R. Schmid, the sculptor, studio 17 Ridley St. It is a remarkable figure as it quietly lies on our table in plastic form and though labelled the "Monarch," we "bar" in mind there is no harm in it.

THE NORRIS PULLEY.

The desire to draw the attention of our many subscribers to the advertisement of the Norris Pulley page V.

The Pulley you can readily see is the only pulley made that does not depend upon the screws to hold it in the frame. The pin being back of the bevel on lower end of Pulley causes the weight of both sash and weight to pull back, therefore the more weight the more firmly the pulley imbeds itself in the frame.

Norris & Co. manufacture the largest variety of pulleys of any firm in the country, Their business extends all over the United States. They are the oldest or one of the oldest hardware houses in the country.

In the last few years the majority of the fine buildings erected have the Norris Pulley in the frames. The architects and builders generally concede that the Norris Pulley is the best on the market, their pulleys range in price from 15 cents to $60 per dozen, and they make pulleys with ¾-in. to 4-in. wheels. All their pulleys are numbered, and as the number designates the size and quality, always in ordering mention the number.

Norris Pulleys can be had of any responsible hardware house in the United States or Canada, or you can address C. Sidney Norris & Co., Baltimore, Md.

Architects wishing catalogues and samples will receive same free of cost.

CABOT'S BRICK PRESERVATIVE.

The sandstone in the New California Theatre building has been treated to a coat of Cabot's Brick Preservative, which has water-proofed and hardened the stone. While it does not appear to have changed the natural color of the stone any more than water would, it leaves no trace of gloss or gum.

SAN FRANCISCO, CAL.

Mr. Bloor received a complimentary vote of twenty-two for the office of Secretary, and the convention also offered to him and to Mr. Hatfield votes of thanks for the faithful and disinterested manner in which they had so long discharged the duties of Secretary and Treasurer of the original Institute.

The committee, which had had in charge the consideration of the important question of the employment of a clerk-of-works, was continued and enlarged, and instructed to report at the next convention.

A new committee was appointed to consider how the members of State Associations and Chapters, who were not already members of the Institute, might become so with as little delay as posssible. A committee on professional ethics was also appointed.

The Secretary was then instructed to prepare and distribute to such journals as he might select, such synopsis of the proceedings as was desirable to place before the profession in advance of the publication of the annual "*Proceedings.*" A member suggested that this was hardly necessary, inasmuch as several professional journals were represented at the convention by reporters, and they would probably publish at once full reports of the proceedings. This, however, seemed hardly to be satisfactory to some of the members, and the instructions were unchanged.

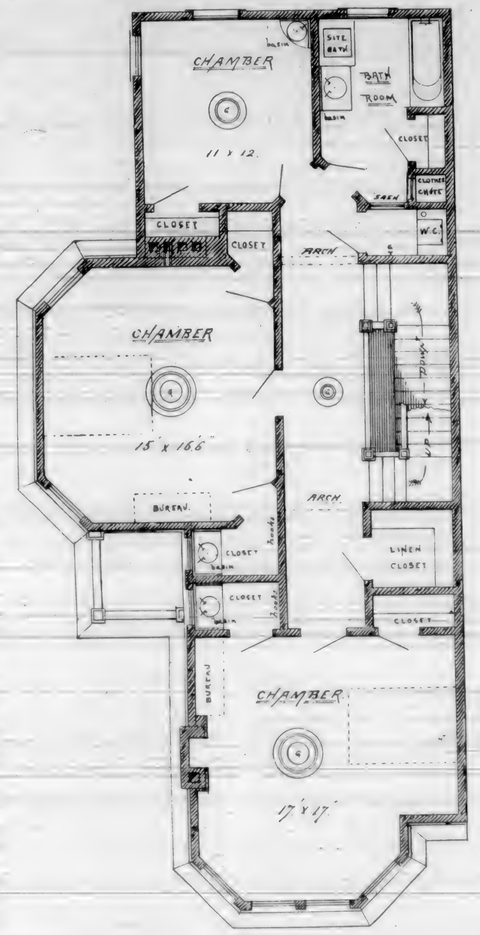
The question of publication having been broached, Mr. Gibson, of New York, said that inasmuch as the *American Architect* had always been the official journal of the American Institute of Architects for purposes of publication, he would suggest that this connection would be continued. As the suggestion at once brought out a protest from different parts of the room, and it so appeared that the members did not care to discriminate for or against any of the architectural journals now published, the suggestion was withdrawn.

During the discussion of the question of annual dues, considerable stress was laid on the injustice of expecting unpaid officials to incur the expenses of attending the necessary directors' meetings and the annual conventions, and it was the hope of those who urged the larger annual due that in this way might be obtained a sum which could be drawn on for a part of, if not all, these burdensome expenses. [The matter of lightening the expenses of the Executive Committee was, we believe, left to the discretion of the directors]. At this stage of proceedings the same matter came up in broader fashion in the shape of a proposition that it should be part of the directors' duties to consider and report whether it were not feasible to devise a practicable method by which the expenses of the members attending the convention might be equalized. As this is an obviously simple thing to accomplish by computing the mileage of those who signify their intention of attending and then assessing the amount equally on all such members, it may be hoped that a step will soon be taken which will make these annual meetings larger and really more representative of the whole country. A delegation could under such conditions afford to come from San Francisco even, while the Eastern men would not be materially affected by the small addition to their own individual expenses. It was, really, of all the suggestions made during the entire convention, the one best worth the making.

Letters were read from the Mayor, Board of Trade, architects and other bodies in Denver inviting the Institute to hold its next convention in that city, but the invitation, as the site was already decided on, was declined with thanks.

The last important act of the meeting was taken by Mr. Brown, of Washington, who offered as an amendment to the constitution, to be acted on next year, a resolution that each Chapter of the Institute might send to the annual convention a member or delegation entitled to cast a vote on all questions equal in amount to the full membership of such Chapter. In other words, the matter of representation by proxy, which we have advocated, is now properly brought before the Institute for consideration, and when one looks back on the business which was actually transacted during the convention, it is discovered that the greater part of the business either was actually done or could have been as well done by small committees whose action would naturally give much more satisfaction if it were taken with the advice and consent of their fellows, who had delegated to them full power to act than ever can the action of individual members, whose presence on a committee hinges on the accident of their happening to be at a convention, where the president's eye chances to fall upon them.

After this as no further business offered, the convention adjourned, subject to the call of the directors.



SECOND FLOOR PLAN.

PLATE NO. 2.

Official Report of the First Meeting of the Board of Directors of the American Institute of Architects, Cincinnati, Nov. 21st, 1889.

Minutes—

The following members were present, President Hunt being in the chair: Messieurs,

Briggs	Gibson	McLaughlin
Bruce	Hunt	Root
Carlin	Illsley	Smith
Cutler	Kendall	Treat
Cummings	Littell	

The following gentlemen were elected as members of the Executive Committee, of which the President, Secretary and Treasurer are ex-officio members: Kendall of New York, three years; Adler of Chicago, three years; Gibson of New York, two years; Carlin of Buffalo, one year.

Mr. Cummings reported on behalf of committee on relations between chapters and the associations as follows:

"At the recent convention of the American Institute of Architects, the undersigned were appointed a committee to consider whether any method could be adopted by which the complication at present thought to exist in the relations of chapters and individuals as to the membership of the American Institute of Architects could be removed.

The committee have carefully considered that subject, and have found themselves confronted by difficulties so great as to prove insurmountable by any wisdom which the committee can apply to them.

The committee recognize fully the desirability of providing that every fellow of the Institute shall be also a member of some one of the local societies organized as chapters. In no other way can the Institute be so well assured of the fitness of a candidate for membership as by his being certified to be a member in good standing of one of the chapters. And the fact of all the fellows of the Institute being at the same time members of the chapters tends to confirm the solidarity of the chapters with the Institute, which is so eminently to be desired.

But, on the other hand, there are doubtless many cases in which an architect residing in a town where no local chapter exists, where the nearest chapter may be located at a distance of hundreds of miles, may desire to become a member of the Institute. He may be in every respect qualified to become a useful member of the Institute, and to receive both pleasure and profit from his association with it. To refuse his admission except on condition of his joining a chapter, perhaps in another State, with which he has no natural affiliations, with the members with which he has no acquaintance, seems a measure hardly less than tyrannical.

The committee confess themselves unable to see any method by which the difficulty can be overcome, and they therefore ask respectfully to be excused from further consideration of the subject, and to recommend it to the wisdom and judgment of the Board of Directors."

For the committee. CHAS. A. CUMMINGS, *Chairman.*

Cincinnati, November 21, 1889.

Mr. Littell moved:

That the full powers of the Board of Directors, not expressly reserved in Article VIII, Section 2 of the By-Laws be rested in the Executive Committee, subject to the obligation to report to the Board, from time to time, when called upon to do so.

Motion carried.

Mr. Gibson moved:

That the Executive Committee shall hold quarterly meetings and other meetings at the call of the President, when the Secretary shall report to him a necessity for the same, or when three members of the Committee shall request him to call such meetings for special business.

Motion carried.

Mr. Cutler moved:

"That in the event of inability to attend a meeting of the Executive Committee, the member so prevented from being present shall notify the Secretary, who shall thereupon, if deemed expedient, notify a director, who attending the meeting shall have full power to act as substitute."

Motion carried.

Mr. Gibson moved:

"That it shall be the duty of the Secretary to notify members of the Executive Committee of any meeting, ten days in advance of such meeting, and members shall at once reply stating their intention or inability to attend.

Motion carried.

Mr. Briggs moved:

"That the following form of ballot be used in the election of members:

OFFICE OF SECRETARY, A. I. A.

.....18

DEAR SIR,—Please vote by striking out the alternative word under the heading "vote," and return the sheet to me at your earliest convenience.

VOTE.	APPLICANT.		LAY INDORSERS.			INDORSING MEMBERS.	
	Name.	Address.	Name.	Occupation.	Address.	Name.	Address.
No. Yes.							
No. Yes.							

.....*Secretary A. I. A.*

Motion carried.

Mr. Carlin moved:

That the Secretary shall enclose with each ballot for membership, a stamped envelope addressed to himself with the words "Ballot for Membership" printed on the outside.

Motion passed.

Mr. Gibson moved:

"That it shall be the duty of the Secretary to notify each candidate for membership of the result of the letter ballot, and enclose a copy of the constitution and by-laws and direct his attention to Article VII, Section 1 of the by-laws and to notify the Treasurer of the new membership election."

Motion carried.

Mr. Gibson moved:

"That the question referred to in Article X of the by-laws be referred to a special committee to be appointed by the chair and to report at or before the next quarterly meeting of the Executive Committee:

Motion carried.

Mr. Briggs moved:

"That a committee of education be appointed by the chair."

Motion carried.

The following committee was appointed: Messrs. Russell Sturges, professor pro tem., Columbia College; Wm. R. Ware, professor architecture, Columbia College; T. Clifford Ricker, professor architecture, Champaign, Ill.; T. M. Clark, Massachusetts Institute of Technology, Boston.

Mr. Kendall moved:

That the Board of Directors now proceed to nominate substitutes for such of its members as were to-day elected and who may be unable to serve, and that such nominees be substituted in the order of nomination.

Motion carried.

The following gentlemen were nominated:

1. Alfred Stone,
2. Levi T. Scofield,
3. W. N. Poindexter,
4. J. W. Yost,
5. E. C. Cabot,
6. G. W. Rapp,
7. W. S. Wicks,
8. N. S. Patton,
9. W. G. Preston,
10. A. S. Bloor,
11. E. J. Nickerson.

The motion of Mr. Glenn Brown presented to the convention and referred to the Board of Directors was tabled.

The resolution related to new sections to be added to the by-laws after Section 1 in Article II.

Mr. Briggs moved:

"That the schedule of charges adopted by the American Institute of Architects and the Western Association of Architects in 1884 be reaffirmed by the American Institute of Architects and printed as an appendix to the constitution and by-laws, and also in the form of a circular with the words "minimum" prefixed before "charges." And if the circular be issued to non-members it shall be plainly marked in large red letters "ISSUED TO NON-MEMBERS OF THE INSTITUTE" printed diagonally across its face.

Adjourned. JOHN W. ROOT,
Secretary.

THE ASTRONOMICAL SOCIETY OF THE PACIFIC.

The object of the Society is to bring together in cordial cooperation the amateur and professional astronomers of the Pacific Coast. Three meetings a year are held in San Francisco at the rooms of the Society, 408 California street; and three meetings are held at the Lick Observatory, Mt. Hamilton, where an opportunity is afforded to the members to see and use the instruments at the Observatory. The yearly dues are five dollars. There is no initiation fee. Any person who takes an interest in astronomy is eligible for membership. Communications addressed to 408 California street will receive attention.

TECHNICAL SOCIETY OF THE PACIFIC COAST.

The Technical Society of the Pacific Coast has for its object the professional improvement of its members, the encouragement of social intercourse among men of practical science, and the establishment of a central point of reference and union for its members. All persons who are engaged professionally in the practical application of science are eligible for admission into the Society. Application for admission must be endorsed by three members of the Society. The entrance fee is five dollars, and yearly dues are twelve dollars for resident members, and six dollars for non-resident members. The meetings are held monthly at the rooms of the Society, 408 California street, where all communications should be addressed.

SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

This Association holds monthly meetings on the second Friday of each month at their rooms, 408 California street. Fellow membership is confined to architects in the regular practice of the profession, who have been established in business not less than one year previous to their application for membership. The objects of the society are to unite in fellowship the architects of the Pacific Coast, promote and sustain their professional standing and dignity, and increase the artistic, scientific and practical proficiencies of the profession.

The Initiation fee is six dollars and the yearly dues six dollars.

BILL TO REGULATE THE PRACTICE OF ARCHITECTURE IN THE STATE OF NEW YORK.

SECTION 1. No person shall practice architecture in this State who shall not have attained the age of twenty-one years, and that hereafter no person shall pursue the business or profession of architecture in this State, except in accordance with the rules and regulations herein described.

SEC. 2. There shall be established and created in and for the State of New York a board of architects, constituted as follows: One member from the faculty of Columbia College, one from the faculty of Cornell University, two from the Western New York State Association of Architects, and two from the New York Chapter of the American Institute of Architects.

Within sixty days after the passage of this act, the presidents and secretaries shall call meetings of the members of these associations, and at such meetings there shall be designated by ballot four from the Western New York State Association of Architects, and four from the New York Chapter of the American Institute of Architects, all reputable architects doing business within the said State of New York, each of whom shall have had not less than ten years' experience as a practical architect. Notice of such designation and the names of the parties so designated shall then be filed with the governor of the State of New York, and from the persons so designated and from the faculties of the colleges hereinbefore named, and within thirty days from the date of filing the names he shall appoint the members of the board of architects as hereinbefore provided. The members of the board appointed under this section shall hold office, for the term of one, two, three, four, five and six years, respectively, and until their successors shall have been duly appointed and qualified. The architectural societies hereinbefore mentioned shall hereafter designate three reputable registered architects doing business within the State of New York, from which number the governor shall fill the vacancy annually occurring. In case of death, resignation, or removal from the State of any member of the board before the expiration of his term of office, the remaining surviving members of the board shall fill the vacancy from the list of names last submitted, and the person so appointed shall be a member of the board for the remainder of the term of his predecessor.

SEC. 3. Manner of organization, etc.

SEC. 4. Time of meetings—and the board to examine all persons applying for examination, and grant licenses to all persons entitled to same.

SEC. 5. No person shall practice the profession or pursue the business of an architect without a license from the board of architects. Any person desiring to pursue such occupation shall apply to the board for license, and thereupon the board at some regular or special meeting shall proceed to examine the applicant as to his qualifications, with special reference to the construction of buildings, strength of materials, laws of sanitation as applied to buildings, and the ability of the applicant to make practical application of such knowledge in the ordinary professional work of an architect. If such examination is satisfactory to a majority of the board, a license shall be issued to the applicant under the seal of the board, authorizing him to practice the profession of architecture within the limits of this State. All licenses to architects shall be recorded in a book provided for the purpose by the clerk of the county in which the applicant resides.

All persons who shall be at the date of the passage of this act engaged in the practice of the profession in this State, shall be entitled to a license without examination on the payment of a fee of $5.

SEC. 6. All licenses shall be subject to revocation by the board. * * * * * No license shall be revoked except by the unanimous vote of all the members.

SEC. 7. If any person shall pursue the business or occupation of architecture in this State, or shall advertise or put out any sign, advertisement or cards designating himself as an architect, without first obtaining a license therefor in accordance with the provisions of this act, he shall be deemed guilty of a misdemeanor, and upon conviction, he shall be fined not less than $100 nor more than $500. No person shall be entitled to a license as an architect who is directly or indirectly concerned in any contract for work or materials in connection with the building business, but nothing herein contained shall be construed to prevent any person in this State from planning or supervising the erection of his own building, nor shall the provisions of this act apply to architects from other States who may desire to compete for some special building, public or private, and who may visit the State in person for such special purpose, nor shall it apply to students or employés of licensed architects within this State acting for and by the authority of such licensed architects.

SEC. 8. Fee for such license shall be $20. * * * All expenses of board to be reported to the Governor of the State.

The above is a copy of the bill which some of the architects of New York State are desirous should become a law. We publish it and leave the matter for our architects to discuss.—ED.

HE KNEW IT ALL.

The builders tell a rather interesting story of a Buffalo capitalist who was pretty summarily taken down for trying to set himself up as the end of all things in whatever he undertook. No matter what was on foot, if he went into it he must have all the say and nobody else was allowed even a side remark. Not long ago he built a fine brick house. In this undertaking, as in all others, he was boss and all hands, dictating to builders, architects and all without the slightest hesitation. At last they grew very tired of the browbeating they had to stand and let him have his way whether it was right or wrong. The house was finished and shortly afterward the owner set about building furnace fires to test his heating apparatus, when behold, there wasn't a chimney in the house!—*Ex.*

THE RESPONSIBILITY OF ARCHITECTS.

THE committee of the Western Association of Architects at its last annual convention reported as follows on the liability of architects according to a number of decisions recently rendered:

"*First Case.*—An architect in this city had charge of the erection of a house for a widow. The contracts had been let to a carpenter in one. It provided the architect to be umpire, and payments were to be made on his certificate. Specifications provided a 'first-class job.' Through neglect of the architect, the work was carried out poorly, extremely poorly in many respects, so that the widow refused to pay the final certificate. The case went into Court, and the judge decided that the widow was bound to pay the architect's certificate, just or unjust, and that if she had any case at all she might bring suit against the architect. So she did, and recovered $800, which was paid by the architect.

"*Second Case.*—A widow erected a mansion under the charge of an architect. She had difficulty in obtaining the plans. Her directions as to changes were not heeded, and she became frightened enough to consult a lawyer. A private superintendent was employed. The architect was notified in writing as to changes being required here and there, and as to work being carried out carelessly. The house was completed and every certificate was paid, since it would have been useless to contest the payment of any of them. There was no evidence as to fraud, though such there was undoubtedly committed. The widow then sued the architect and recovered judgment for $4,500, which remained final.

"*Third Case.*—A citizen erected a block of houses during the winter. The architect neglected to provide means for keeping out the frost, and allowed the mason to build dwarf walls upon the frozen ground. Through this the building became to a considerable extent damaged, and the owner brought suit. The first verdict obtained was $1,400 against the architect, who appealed and received, incidently so, as it would appear, an order for a new trial. The case was thereupon tried again in another Court, and verdict was obtained against the architect for $1,900. The case had been tried more effectively, and the facts brought to the understanding of the jury.

"In all these cases the specifications had a preamble in which the architect was declared to be, in so many words, sole arbiter. Doubtless there are many more similar cases on record.

"In case an architect should not thus expressly declare himself to be sole arbiter, he would not be excused, but held under the rule of established custom. If, however, an architect expressly declares that he is not arbiter, and had nothing to say and to rule, he could, of course, not be held liable. But would not his position be simply pitiable? No respectable architect would like to be under such predicament.

"Every architect should be fully aware that his profession is one that may entangle him in scores of liabilities, and he should prepare himself accordingly. He 'professes' to know, and ought to know. He stands on the same legal ground with every other professional practitioner, with this difference: that his malpractice is far more clearly and positively established than is the case in any other profession. The preacher has nothing to fear on this score. Little more has the land agent. Slightly more still the doctor and the lawyer, but nearest to the architect comes the operating surgeon. Many law-suits have established the certainty of severe consequences to the course of the surgical operator upon human bodies when he commits a blunder or even an error.

"There is nothing more certain than that in all cases the architect is legally and pecuniarily liable for every blunder by him committed, or under him, through the agency of any of his employes. The responsibility on this account is far-reaching, and surpasses that existing with any other profession."

Our space does not permit us to quote further from this valuable report, so full of hints to the careless. The inference to be gained is, that the cautious, prudent architect will so word his certificates that he will not take *all* the responsibility, but he may express it "as his opinion" or "in his judgment" the work has been done according to contract.

NOTES AND COMMENTS.

A handsome model of the grizzly bear "*Monarch*" adorns our editorial table. The cast was presented by sculptor R. Schmid, and represents the great animal crouching with one paw on a shield bearing the Coat of Arms of the State of California. The modeling is excellent, full of life and a credit to its author.

The nine-story *Chronicle* building is now nearing completion. As the *Chronicle's* great rival, the *Examiner* seeks to "double discount" any enterprise exhibited by its contemporaries, *it* now makes the announcement that it intends to erect a building. It is safe to say that the *Examiner* will do what it says; and the new structure will astonish the natives—will be a veritable "monarch" among our buildings.

Senator Fair it is reported intends to spend $200,000 in adding two or three stories to the Lick House. A Chicago architect has been consulted, though work on the building will not be commenced before next spring.

Read our list of books for sale and notice that a subscription to this journal for one year will entitle you to a rebate on purchase price of a book if sent direct to this office.

Draughtsmen out of employment will do well to leave their address at this office.

It is reported that the obelisk in Central Park, New York City, is in danger of being seriously injured by disintegration. It has been scaling off ever since it was brought to this country, and there is great danger that within a few years the hieroglyphics will be entirely obliterated. The obelisk was coated with paraffine a few years ago, but the remedy did not prove effective. The Park Board will make another effort to preserve this monument, and in order to ascertain what is best to be done, have appointed a committee of professors to examine the stone and report as soon as possible, as to its condition with particular reference to its preservation.

The stone is a native of a climate of an equable temperature, and evidently its health can not stand the shock of repeated changes from intense heat in summer to equally great cold in winter. We would recommend that the obelisk continue its journey westward and take up permanent quarters in Golden Gate Park where it would, we have no doubt, receive a cordial welcome from the monuments to other celebrities, which have long enjoyed the mildness of our glorious climate with never a complaint about the night air.—Ed.

The profession has heretofore had so little political significance that it has been hard to enlist our daily press in any measure of professional interest. In fact, the tendency has been to ignore the architect—"*Building.*" [To a certain extent this has been true, but we note a change in public sentiment in this direction.—Ed.]

In medicine and law both, the public is protected—the one profession involving life, the other property, while in architecture, involving both life and property no legal restriction is imposed and any ignorant trickster may open an office and victimize the public.—"*Building.*"

The question of licensing architects so as to have a check on gross inefficiency is a wise step, but how incomplete a step it is without throwing a like protection about the enlightened competent mechanic and contractor.—"*Building.*"

Advertisements on buildings should be taxed in the ratio of their obtrusiveness. A constituted authority should be appointed, to whom individuals feeling aggrieved could refer any act of vandalism upon artistic propriety or educated public taste.—*English Exchange.*

While such restrictions might be tolerated in England, we very much fear no such sweeping regulations could be put in force in this country, though occasionally we have known an owner to appreciate the architects case in producing a handsome edifice, by restricting the size and location of his tenant's signs.—Ed.]

Mr. Charles Follen McKim, senior member of the firm of McKim, Mead & White of New York has put $20,000 into the hands of Professor Ware of the Architectural Department of Columbia University to be used by the trustees as a perpetual maintenance of a traveling scholarship or fellowship to that university. With the traveling scholarship already founded through Mr. Schermerhorn and the McKim benefaction, Columbia University will be by far the best endowed in the Architectural Department of any school in the country. Some day California will be heard from through her generous benefactors, but the thought has not quite ripened yet.

The panorama of the Battle of Gettysburg painted by E. J. Austen, and several European artists, now on exhibition at Tenth and Market Streets, is a remarkably vivid representation of an exciting battle; the subject chosen for representation is of great interest to all Americans, and has been handled in a truly masterly manner.

The project to change the grade of Market Street from Valencia to Fifteenth Street, which it was proposed some time ago has been revived and brought before the public again, by an application to the Board of Supervisors. It is proposed to lower the grade at the highest point, twenty-six feet (from sixty feet to seventy-five feet) and by raising the grade in the low portion beyond the cut, to make an easy ascent and by this means induce the business of the street to extend itself along Market instead of branching off up Valencia Street.

In the appeal case of Robert Barton vs. Contractor McDonald for damages for personal injuries caused by falling into an unguarded hole on East street, the Supreme Court has affirmed the decision of the lower Court in favor of plaintiff Barton.

The decision holds that when the condition of a public street is made dangerous by a contractor in repairing the same, he shall erect and maintain around the dangerous spots a good and substantial barrier, and for failure to do so he is guilty of negligence.

The *American Architect* makes the following sensible suggestion to architects: "Of course in regard to many building matters it is necessary to follow the advice and direction of ladies, but keeping in mind feminine amiability, which may at a moment's notice forget all promises, directions, etc., the prudent architect will provide himself with memoranda in the good wife's handwriting, that he may have recourse to it if necessary to establish his claim."

The cause of the above advice grows out of a suit by Architect Manly N. Cutter against Mr. Morris, a gentleman of wealth in New York City. The case may be summed up like this. Mr. Morris engaged Mr. Cutter to build an extension to his house—a room in which a person addicted to snoring could sleep without disturbing the whole house. Mr. Morris then went to Florida and expected to find on his return the work completed for five thousand dollars.

What was his astonishment on his return to find the change had already cost twelve thousand dollars and that fifteen thousand more would be required to finish according to the designs suggested by his wife during his absence.

Mr. Morris sued the architect for sixteen thousand dollars' damages—but the suit was thrown out of court, and Mr. Cutter's suit on his bill was entertained though it took years to get judgment. Mr. Morris, like other rich men, took advantage of his wealth and had the case carried to the Court of Appeals, which has just ordered a new trial.

OUR ILLUSTRATIONS.

Plates No. 1, 2 and 3 show the plans and elevation of a small residence intended for a corner lot—Huerne & Everett, architects.

Double plate No. 4 a residence designed by H. T. Bestor, architect, to be erected at the Sandwich Islands. Wide verandas and projecting cornices shade the building and protect it from the heat of the tropical sun. A feature which might be oftener employed here to advantage, where space is obtainable, is the location of the kitchen and its appurtenances in a separate building.

Plate No. 5 shows the main entrance to Cooper Medical College, corner of Sacramento and Webster Streets in this city, of which Messrs. Wright & Sanders are the architects. It is the first of a series of views we propose to publish from time to time, of the entrances to some of our public and private buildings.

SCHOOL-ROOM SPACE.

Mr. Courthope Bowen, an Englishman whose opinions on the proper size and arrangement of school rooms are received with great respect in his own country, recently made the following statement as to what, in his judgment, might be regarded as a fairly good schoolroom: Taking, for instance, a room 14 feet high, fairly ventilated and always well aired at recess, two-thirds of the floor space should be assigned to the scholars and their desks and the other third should be kept for the teacher, blackboards, etc. With single desks, 22 inches should be allowed from side to side, and 3 feet from back to front for each scholar. The passages need not be more than 18 inches for those running from back to front, and 1 foot for those running from side to side. In such arrangement, counting the passages, each scholar has (without reckoning the share of the space allotted to the teacher) a trifle more than 40 inches from side to side, and just 4 feet from back to front. In a room 25 feet by 20 feet the floor space for scholars' desks will be 16 feet by 20 feet, with 4 feet from back to front per row, and accommodation is provided for 20 scholars. The whole floor space is 500 square feet, and the cubic contents of the room 7,000 cubic feet, with 20 square feet and 280 cubic feet per person.—*Ex.*

CURRENT PUBLICATIONS.

American Architect, November 16th, contains: "Filtration at the Experimental Station in Lawrence," "The Sulphur Mines of Sicily," and "Columbus" (a pilgrimage to Palos) by Fred A. Ober. November 23rd, Convention Western Association Architect. November 30th, Cincinnati Exhibition, Report of Recent Conventions; Illustrations, Courthouse, Savannah, Ga., Wm. G. Preston, architect, Boston, Mass.

Building, November 16th, contains: "Notes on Estimating," David W. King; "Sir Christopher Wren and His Architecture," and illustrations of Madison Square Gardens, McKim, Mead & White, architects, New York; also design for Cathedral St. John the Divine, New York, J. Roth, architect. November 23rd, "The Electric Motor for Domestic Purposes," H. P. Prindle; "The Barye Exhibition," and design of Covered Well III mentioned in competition, New York Sketch Club. November 30th, Proceedings' Convention, A. I. A. Design for Iowa Soldiers' Monument, A. E. Davis, architect, Mott Haven, New York City.

Inland Architect, November, "Romanesque Architecture" (Baptisteries or Rural and Mortuary Chapels), "Steam Plant for Isolated Electric Light Plants." Illustrations, Monadnk Office Building, sixteen stories high, Burnham & Root, architects, Chicago.

Engineering and Building Record, November 16th, "Suspension of Hot Water Transmission Through Streets," "Pavement Specifications, "The Prall System," "Public Heating Schemes," "The Proposed Channel Bridge" illustrated. November 23rd, "Filtering Experiments by the Massachusetts State Board of Health." Nov. 30th, "How to Use Steam Expansively in Direct Acting Steam Pumps," J. F. Holloway before the A. S. of M. E. "Hot Water Heating," and full account of the convention of architects.

Journal of Proceedings, (R. I. B. A. organ) November 7th, contains: "The President's Address," Mr. Alfred Waterhouse, R. A.; a most valuable and complete discourse upon the architectural necessities of the present time, also "Angles and Terminal Features," F. T. Bagallay.

Painters' Magazine, November, "Relief Work in House Decorations," "Painting in this Country," "Ancient Process of Painting," "Decrative Treatment of Doors," "Wall and Ceiling Designs," "Modes of Mural Decoration," "Modern Methods in Decoration."

Sanitary News, November 16th, "Certain Provisions of Continental Legislation Concerning Food Adulteration," "The Amines Process of Sewerage Treatment," R. Godfrey; "The Responsibility of Architects." November 23rd, "Contamination of Drinking Water by Lead," Sinclair White, M. D.; "Licensing Architects." November 30th, "Kitchen Drainage in Philadelphia," "How to Have a House Built."

The Architects', Builders' and Hardware Journal of Atlanta, Ga., has made its first appearance, for December, edited by Thos. H. Morgan, and presenting a creditable showing for Southern enterprise in this its first number It contains three photo-litho. plates of prominent buildings; notably, the Confederate Veterans' Home, Atlanta, Ga., Bruce & Morgan, architects. It should receive the hearty support of the section it represents.

The Western Architect and Builder of Cincinnati, November, publishes a short illustrated article on "Tenement Reform."

National Builder Chicago, November, "Mortars and Concretes of Antiquity and Modern Times," Adolph Cluss, architect; "The Art of Drawing."

The Journal of Building, Pittsburg, Pa., has appeared in its initial number. We wish it success. It is published semi-monthly; price until February 1, 1890 being $1.00 per annum, regular price $2.00.

Brickmaker, November 15th, "Petroleum as a Fuel."

American Engineer, November 20th, "Marine Engineering upon the Mississippi," "Dr. Joule, the Discoverer of Mechanical Equivalent of Heat."

Ye American Builder, December, "Classification of Joints," "Masonry," "Hip and Valley Roofs," "Stairs of a County House," "Strains in Trusses."

Northwestern Architect, November, is devoted wholly to the Consolidated Convention except an article entitled "Evaporation of Water in Traps," Glenn Brown; illustrations: Apartment House, Minneapolis by G. W. and F. D. Orff, architects.

Canadian Architect for November contains: "The Relation of an Architect towards Contractors," G. F. Stalker.

Architectural Era, November, "Canterbury Catheidral," "Byzantine Architecture." Illustrations: The Schermerhoen, H. J. Hardenberg, architect.

Western Architect, Denver, November, "Development of Form as an Expression of Beauty, Shown in Traditional Types and Styles of Construction and Decoration," "The Manufacture of Brick." Illustrations: Design for Cathedral, Salt Lake, M. D. Kern, architect.

Fire and Water, November 16th, Description, illustrated, of the Madison (Wis.) Water Works. November 23rd, "To Reduce the Fire Loss in Manufactories."

Clay Worker, November, "What Clay Has Done for History," "Brick Making and Burning."

American Machinist, November 21st, "Force, Motion and Work," "Practical Drawing," J. G. A. Meyers.

The Mechanical News, November 15th, "Electricity in the Engine Room," James F. Hobart.

Scientific American, December, designs and description of the New Bourse, Paris, M. Berteault, architect.

House Painter and Decorator, November, "The History of House Painting," "The Suggestive in Decorative Art."

Northwestern Mechanic, November, "Vibration in Buildings," "Petroleum as Fuel," "Electricy in the Engine Room."

The Builder and Woodworker, December, "Door Frames."

HAS OUR ARCHITECTURE A NAME?

No building ever produced would have been pure architecture in the eyes of any preceding age. Whatever in it was novelty would have been regarded as an innovation and in bad taste.

The complaint that when we vary from historic precedent we will have no suitable *name* for our architecture—will not be able to call it Doric or Romanesque or Saracenic, or by some other well-known name, is a complaint that means nothing. No style ever produced had any name until the title was given afterward.

Had anyone asked the architect of the Parthenon what style he was building in, or had anyone called upon Waynflete, as the Cathedral of Winchester rose above the ground, and asked him what style he was building it in, what would have been the answers? The work of neither one could be named by any historic title. So that if we are able at this time to say whether our designs are Romanesque, Syrian or Byzantine, it constitutes no reason why the design may not be good, but if it were exactly in imitation of the art of a thousand or two thousand years ago that would necessarily render it objectionable.

To attempt to make a building, erected for modern uses, in this country, look as though it had been built by the Greeks or Romans two thousand years ago is folly. A man who complains of a design because it uses *some* of the elements of Greek or Gothic, without using all of them, and because it uses some elements the Greek or Medieval architects did not use, might with equal propriety have condemned the design for the Parthenon because it was not a counterpart of the cave of Ben Hassan.

This is our lesson, that we shall do the best we can from all that we know. Be independent enough to use our knowledge of history and historic work, combined with whatever we can invent, beautifying each production to the limit of our ability, serving each purpose of the building as best we are able, and letting the name for our architecture be assigned by future generations.—*From a paper read by J. W. Yost, architect, before the Ohio Architects at Dayton.*

"Hints on House Building" by Robert Grimshaw.—A new book just published for the benefit of those who contemplate building dwelling houses. Almost everything is suggested that need be thought of for those who desire to know beforehand the kind of house they should build, how, and where to locate it. Read it and you will be told in a unique and pleasing manner how to build. Price 50 cents. Sold by Practical Publishing Co., 21 Park Row, New York.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE ARCHITECTS, meets second Friday of each month at 408 California Street.

TECHNICAL SOCIETY, meets first Friday of each month at 408 California Street.

THE regular monthly meeting of the San Francisco Chapter of the American Institute of Architects was held Friday evening, January 10th. The regular business of the Association was transacted.

Mr. Sanders, the teacher of the class in drawing, reported on the work done and progress made by his class during the year just past, and made an interesting exhibit of the work done by his pupils. The designs gotten up in competition for the prize offered by the Chapter, were shown, and received much well deserved commendation, for they gave evidence of careful study and were very neatly executed.

Mr. Sanders stated that arrangements had been finally made to establish the class in Mathematics, and gave notice to would-be students to meet Monday evening at his office to decide on the evening and hour of meetings.

WITH this number we begin our Eleventh Volume. After ten years of progress and improvement, we enter on the work of the coming months, determined to make the pages more interesting and the illustrations superior to whatever has gone before.

The outlook is promising. Work the past year has been plentiful and the prospects for a busy and prosperous year to come could not be better. With good crops for our farmers, plenty of work for mechanics and a generous patronage for the CALIFORNIA ARCHITECT AND BUILDING NEWS we, each and all, can enjoy the benefits of our honest labor.

The older cities and towns are making up to the requirements of the times, and many of them are asking for the more spacious modern public building. New towns are starting up all over the coast, peopled mostly with a cultivated and energetic class who have come to stay, if we may judge by the tasteful and home-like appearance of their villas and cottages, while active preparations are being made for a greatly increased number of this kind of improvements.

The large tracts of our best lands held under Mexican grants have in many instances been divided into farms, and sold to actual settlers, which necessitate commodious and modern farm buildings in place of those required for extensive cattle ranges.

The fact that all the Eastern lines of railroads must make this Coast the outlet for their trade, will have an important influence on the permanence, capacity and convenience of the business structures that may hereafter be erected; already the ground is broken for several, and others will follow in the early spring.

The people have come to the conclusion that better facilities must be furnished for pure water supply, and for protection against fires, and many large blocks of capital are finding their way into such enterprises which will require suitable buildings, and engineering works.

Many new projects and industries are coming to the front,

many of the older ones are being extended or improved upon, and almost without exception the buildings and plants hereafter erected must be of the most modern type. To these structures, together with residences and buildings, a large share of the attention of the Architect can be profitably directed.

The indications for a period of general prosperity have given an impetus to the various industries furnishing materials; new brick-making establishments have entered the field and the older ones have extended their facilities. Improved fire-proof constructive tiles and terra-cotta are obtainable. Our granite quarries can now supply any color, stone from black to white (including mottled, red, and gray) and any size up to 25 or 30 feet. Many new marble quarries have recently been opened, and marble from jet black to spotless white can be supplied of large sizes. The available sand stones running through all the various shades of red, blue, yellow and nearly white, and slate from native quarries are now obtainable in the market.

The great forests of redwood, pine, fir, cypress, cedar and many of the ornamental woods are being worked into practical shape for the market with an increased energy. The great natural asphaltum mines in the Southern section of the State are being worked by more powerful companies, the natural oil wells are receiving their share of attention, and the recent strikes of natural gas in various localities, having taken the "croakers" by surprise, the possibilities being beyond computation, prosperity seems reasonably assured, and the prospect opens up a wide field for technical knowledge and artistic design which can be used advantageously for the public good, and in our next December number we hope to chronicle the fulfilment of these splendid promises.

One word more, it is hoped that the architects throughout the Pacific Coast will take a personal and individual interest in the success of this journal; encourage it by practical suggestions and contributions, and bear in mind that its columns are always open for the discussion of subjects of interest to the profession, or tending to the advancement of its standing and influence.

We publish in this number, the paper read before the December meeting of the San Francisco Chapter of the American Institute of Architects, by Mr. K. Shimoda, a member of the Japanese Institute of Architects, and of the Penitentiary Association of Japan.

The paper was illustrated with many photographs of Japanese scenery and colored drawings of carving and decorative design, which unfortunately cannot be properly reproduced in the space at our disposal.

Mr. Shimoda described in an interesting manner, the construction of a Japanese hut and a Japanese palace of thirty centuries ago, and thence traced step by step the improvements that have resulted in the typical Japanese architecture of the present time.

Though Mr. Shimoda very modestly disclaimed, in quaint expressions, any wisdom of his own, he strenuously insisted that his countrymen should have the credit of producing an entirely original style of architecture, the result of the evolution of ideas not borrowed, but entirely distinct from the works of any other nation.

Mr. Shimoda is now studying the methods of this country, previous to visiting other nations still more distant from his native land, and learning the uses and relative importance of the methods of construction, and the ever increasing number and variety of materials employed in the erection of our buildings; the object in view being the instruction of his countrymen in the manner and customs of the outside world. He proposes to make something of a stay in this city, and to become better acquainted with our language and habits, when he will visit the art centers of the world to continue his observations and studies. We bespeak for Mr. Shimoda friendly greeting and assistance from the profession wherever he may stop on his tour.

We notice the formation of the Golden Gate Improvement Club, composed of property owners north of Golden Gate park and westerly from Scott street to the ocean beach. We would suggest that a strip of land, at least the width of Fulton or D street, be taken along the full length of the northerly side of the park, making the street double width for the whole distance; that a first-class sidewalk twenty or twenty-five feet in width be constructed on the park side of the street, thus forming a wide promenade three miles in length; the ocean breezes coming through the park furnishing pure air in such abundance as to place beyond comparison with that of any other city.

As a matter of convenience for the public, no one particular car line should have a monopoly, but, with such increased width all the main lines centering on that side of the park should have the right of way along the whole length, so that visitors may alight at any desired point.

While the cause, effect and results of the late Boston fire are being investigated for the purpose of fixing the origin, loss and, if possible, teaching us safer modes of constructions, it may not be out of place to make a few statements as gleaned from our exchanges.

The *cause* appears to have been from the falling of an electric light wire upon a wire used for transmitting electric-clock signals and with which the building first destroyed was amply supplied. That seems to have been the cause of the fire, the effect we know, and the result of the investigation, if fastened upon the companies interested, is an important one. In twenty minutes from the sounding of the first alarm, the building first attacked by the fire, six stories in height and built of granite, brick and iron, was a mass of smoldering ruins in its own basement.

If as a *result* of this latest conflagration, *anything* shall have been taught us regarding the proper construction of buildings or the best means to stay the progress of a great fire—to say nothing of the *cause*—we may be truly thankful for the lesson. In any city where there are narrow streets—high buildings with immense, unprotected plate-glass windows—telephone and electric wires placed without proper inspection—and a water supply that loses its power as an extinguisher at the third story, we may rest assured that the necessary elements of a conflagration are only waiting for a *cause*.

The latest information of an electric-light wire fire, comes to us under date of 8th inst. from St. Louis, when the Western Union office was burned out. *Cause:* (we quote from the dispatches)

A network of wires led into the building by way of the roof. The storm of yesterday loaded these down with a heavy coating of ice, and yesterday and last night many breaks occurred. This morning a wire leading to the basement came in contact with a broken electric-light wire, at once setting the building on fire. *Result*: Many narrow escapes from death, and the building destroyed.

That we legally allow the *cause* for fires to be over our heads, in our houses, and under our feet, is a matter that must sooner or later provoke action as to the responsibility of these companies, who are jeopardizing our lives and property.

Referring to the foregoing we present a condensation of the law of July 27, 1859, governing the height of buildings in Paris.

CONDENSATION OF THE LAW OF JULY 27, 1859, REGULATING THE HEIGHT OF BUILDINGS IN PARIS.

The height of buildings fronting on public street is determined by the legal width of such streets and is measured at the centre of the building, beginning at the sidewalk level and including all entablatures, attics and other features built on the line of the front wall.

This height may not exceed 11.70m. [38.37 ft.] on streets less than 7.80m. [25.58 ft.] wide.

14.60m. [47.88 ft.] on streets between 7.80m. and 9.75m. [25.58 ft. and 31.98 ft.] in width.

17.55m. [57.56 ft.] on streets 9.75m. [25.58 ft.] wide and over.

On streets 20m. [65.60 ft.] wide and over. the height may be carried to 20m. [65.60 ft.] but in no case shall the building contain more than six stories including the entresol.

The height of the ridge above the cornice shall not exceed half the depth of the building, including the cornice projection.

The profile of the roof on the street side shall not pass beyond a line running at 45° from the outside of the cornice.

On boulevards, quais, public squares and streets not less than 15m. [49.20 ft.] in width, and also in interior courts this line of 45° may be replaced with an arc having a radius not greater than half the depth of the building, but the projection of the cornice shall not fall within this arc.

Chimneys shall not penetrate the roof at less than 1.50m. [4.89 ft.] from the line of face nor rise more than .60m. [1.96 ft.] above the ridge.

The front wall of Dormer's shall be at least .30m. [.98 ft.] back of the face of main wall, and the entire structure of the dormer should not rise more than 3m. [9.84 ft.] above the base of the roof. Their width shall not exceed 1.50m. [4.92 ft.] The walls of dormers must be parallel with one another and the distance between them must be at least 1.50m. [4.92] whatever the width of the dormers may be. A second range of dormers may be employed if kept within the prescribed profile.

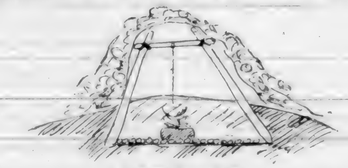
The minimum height of a story shall be 2.60m. [8.52 ft.].

The projection of a cornice shall not exceed the thickness of the wall at its summit.

We are pleased to second the suggestion of the *Inland* that the first work to be accomplished by the Consolidated Convention of Architects, shall be toward the establishment of a legal status for architects—in fact, we have in the columns of this journal already mentioned the matter. To bring about this result there must be action—harmonious, united, and *followed* to a conclusion. This must come from the profession itself, and there should be no wasting of words, or personal bickerings over the subject. It is a fact not generally considered—and not to be wondered at—that the standing of an architect in this country—professionally speaking—has not been determined.

It is true, that "by their works ye shall know them"—but the same may be quoted concerning the lawyer and physician, who are, by our laws, legalized, and have thereby a social and a professional standing in the community. We commend this subject to our leading architects that preliminary action may be taken at once.

AN OUTLINE OF JAPANESE ARCHITECTURE.*



An Early Japanese Hut.

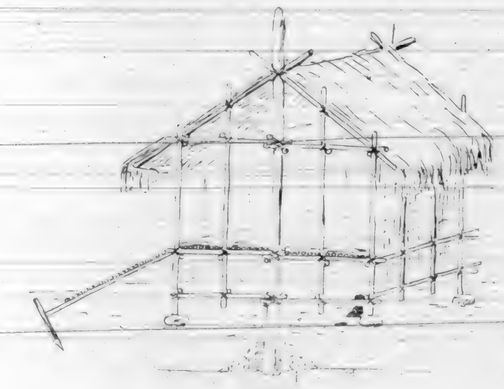
Gentlemen:—I am very much pleased to come face to face with you, here, as an honorary member of the most celebrated Institute in this civilized nation, by the most obliging introduction of Mr. Sanders, although I am a young architect from Japan.

Since I am a member of the Japanese Institute of Architects and also of the Penitentiary Association of Japan, I have engaged to report every interesting note, and every advantageous method, to our membership. Although, I am one of the scientists of Japan, here, I am simply a young boy; now, if I explain any scientific theory before you, it would be just the same as to lecture "gravitation law" before Sir Isaac Newton; and if I report some practical result to you, it would be just the same as if a child should advise its parents not to fall into the ditch. Then there is nothing to speak before you about the facts in the civilized world; but fortunately, I have one subject, "The outline of Japanese Architecture in the past and the present," which is not yet well known to other civilized nations; and although it may interest, it will not increase your scientific or artistic ideas directly; however, I think, in some cases it will be a good thing for architects to know all about the physical phenomena and building styles of every nation of the world. I am very sorry that I have had no higher education in writing and oratory, like the politicians and lawyers, and it will be difficult for you to understand my broken English, yet, if you please, I hope you will excuse me if I speak a few words more. From the science of astronomy we know of the Nebular theory, which theory treats of the special elements of the heavenly bodies, or present universe, after variation took place. The earth is said to have been spilt out as a small portion from the central and main nebular mass, and revolves around that mass by regular attraction without change; and the constitution of the earth is composed of sixty-eight or commonly sixty-three elements, as are all other planets, for their origin is the same. Those planets which were small in size when spilt out from the main nebular mass, are said to be solidified more easily than large masses; and the formation of the stone and iron periods and even the sulphuric acid and coal periods, through which the earth has passed, might be supposed to be the same in other planets, but there never has been any communication from them to the earth, except broken meteors, which suspended in the atmosphere of the earth, being cast from other planets when the earth moves through the fixed path and across between several planets in June, July, August and September, especially when it comes to the atmosphere of the earth, is great velocity and friction produced and it is heated and falls down upon the ground as a ball of fire. Although we may analyze and examine the meteor, chemically or physically, we are unable to know the social condition of other planets, and of course we cannot judge of its social customs and building styles, since the meteor is not news or a record of the social degree of the other planets. In the next step, the science of geology tells us about the formation and life of the small and hard earth, which has been solidified from a liquid state, at a great depth from the surface of the earth, and after many millions of years have elapsed, we are now of a moderate size and active human kind not so fat nor slender, and quite different from all other animals in all respects; but I cannot tell you how the inhabitants of the other planets, of the same origin, are formed. Surely, an opportunity to communicate the same has not been granted except theoretically, as I said before; then all the artificial works of the earth, such as buildings, must have been originated by human kind of the earth without any aid from others. Well, about the view of the new science of anthropology, Prof. Agassiz expressed the doctrine of polygency, or the assertion that there are eight centers of human tribes on the earth; but Mr. Darwin advanced the theory of only one center, or one origin on the earth; those who believe in monogency or the essential specific unity of the human species, have long warred with each other without satisfactory results. As you know, many authors investigated eagerly the skin, hair, eyes, voice, trunk, extremities, skull, stature, proportion, weight and strength, after collecting and classifying several kinds of fossils and ancient tools for working, from every part of the world; I prefer the former, or the theory of polygency, as a more scientific theory than the latter, by the aid of architecture and archæology. I am sure it is not difficult to theorize and judge from the imperishable relics of the stone period, which we obtain from the ground, but ages before history or even tradition began, it can be shown that man lived on the earth; and human remains are found associated with the fossil relics of animals now extinct and belonging to a period of probably 50,000 or 100,000 years ago. Sir John Lubbock, our greatest authority on the subject of anthropology, thinks man existed during the Miocene period; and the other day it was reported that bones taken from the undisturbed caves in Miocene rocks on the Mediterranean coast, had carved on them figures of prehistoric animals.

*A paper read before the San Francisco Chapter of the American Institute of Architects, December, 1889 by Mr. K. Shimoda, member of the the Japanese Institute of Architects and of the Penitentiary Association of Japan.

The earliest architecture of which we have any record, is that of Egypt. It is the best constructed and best preserved of all ancient styles, and it is very remarkable that the oldest specimens remaining are the most perfect. We have no means afforded us by which we can trace the origin and development of architecture, in the oldest cradle of the art, but we can well imagine that a long period must have elapsed before the mechanical skill was developed which the execution of these great works displays. The well known pyramids, which are situated near Memphis, in lower Egypt on the western banks of the Nile and close to the margin of the desert, are the oldest existing specimens of human architecture; but a telegraph engineer, who repaired the cable in the Atlantic ocean last year, reported many immense works of the stone period, discovered by him at a great depth; this will be explained reasonably as the origin of the Egyptian architecture.

Thus, we suppose that the earth has undergone many great changes since its formation, and we may consider Egyptian art to be a recent work, if we compare the stone period with the birth of the earth. In the twelfth century B. C., an essentially brilliant period in Egypt, there existed the first famous stone work, the pyramid of Ghezh. About that period, in Japan, the first work was done, a palace was built for the ancestor of the Emperor. Its construction is scarcely known. Thus, by collecting several kinds of records and pictures, at first it was necessary to dig the ground till they reached a large stone or rock stratum, and standing a large log upon this foundation, which they called "the heavenly column", and the bottom of the column was to be hardened with stone or gravel; all other smaller columns for compartments were built radiating towards the heavenly column and they were tied with a strong rope, without using any metallic fastenings, such as nails. Its floor consisted of a range of small logs and its roof was covered with branches and bark; it was a rule to make the floor very high, or about eight feet above the ground, but it was not for the purpose of avoiding moisture but it enabled them to look at the noble and



bright sun. They respected the sun as a heavenly superior, and consequently, they were pleased to attend constantly from morning until evening, a much longer time than the common people or cave dwellers did. In such circumstances the common people continued for a long time to live in caves, working in the daytime as hunters, fishers and agriculturists, and sleeping in caves at night. From about the sixth century, B. C., the palace building came to be advanced in its construction and appearance—metallic fastenings were used to combine timbers. Planks for floors were selected to be as thick and broad as possible. The roof was covered with bark and sawn boards of timber upon the framing of small timbers, and care was taken to build so as to resist the wind; even common people began to build a log hut within the caves, but gradually they *elevated* the *floor*, and at last they made the floor on the ground out of the caves.

In Japan there are many stone quarries, containing Plutonic and volcanic stone, together with many great tracts covered with wood fit for building purposes, tools, furniture, etc. However, the ancient Japanese could not have been strong enough to work at stone hewing, therefore there was no stone work like there was in ancient Egypt, although it is one of the oldest countries. All houses which were made of timber and bark, as bird nests, were always destroyed by violent storms and destructive earthquakes. I am sure that the first step of the Japanese architecture, as bird nests, was not introduced from other foreign countries, while after many years have passed, some parts of Indian and Chinese architecture are said to be imported. We can easily explain that the origin of Japanese architecture was independent, or in other words, the original Japanese tribe was not derived from that of China by anthropology, archæology, or architectural styles. But after several years had elapsed, social phenomena was introduced little by little; while the quality of the brain of the Japanese is just opposite to that of the Chinese. The Chinese are so slow that they do not think about improvement, while the Japanese are so active that they improve as quickly as possible; and not only their strength and voice, but their skull is much different in form and proportion. Consequently, though Japanese architecture resembles the Chinese, its origin is not the same, for Japanese architecture is original.

As you know, architecture is divided into two parts: one, being original architecture and the other copied architecture. The ancient Assyrian low-relief and bas-relief are put on very thick walls (15 or 16 feet thick) but not the same plane. This is considered to be an imitation of the Egyptian architecture; hence the style is called copied architecture, and among the low and bas-reliefs, rivers, trees, groups of prisoners, battles, the King in his chariot, etc., are the subjects of representation; but the material is different from that of the Egyptian architecture. Painting is just the same, and especially the King in his chariot is sculptured and painted both on the walls of Egypt and Assyria. As the fundamental rule of the art, we must not care to imitate the figures exactly or to resemble very justly its nature. The original Japanese pictures are said to be conventional representations, while the foreign pictures are naturalistic representations, and Egyptian pictures indicated roughly its condition and were conventional representations. At present, Japanese conventional pictures are approved by some foreign artists. In Japan, less than a century ago, there was no one who had any mathematical ideas or notion of mechanics. Again, even the ancient Egyptians built edifices triangular in form, which were assumed to be firmly fixed according to mechanical theory, while the edifices of Japan are always rectilineal and not in a state of equilibrium, as it changes to the form of a rhombus by wind pressure, and it inclines to the form of the letter M by the weight of snow. A triangular frame is stiff and diverges all of the pressure and weight to all directions, as that of an arch. In these points, we may say that Japanese architecture took a dark way far from all scientific and mechanical ideas, and a long period was spent, like bird architecture, without any favorable progress. In the year A. D. 720, they invented a kind of tile in order to protect the roof from wind. At the same time they discovered some materials from rock to paint timber, and they began to build stores to keep their precious goods, detached from their residences. In A. D. 794, there was a very strong and magnificent palace built at the capital Kyoto. At the next instance, a regulation was established to make many city improvements; then powerful persons and rich men built their houses newly and closely, but the number of great fires increased and

they were obliged to think about the preservation from fire, and they began to coat the reed or bamboo framed partition with slimy earth. In the beginning of the eighth century they invented plaster, which was composed of lime, sand, straw, weeds and water; and they used to coat two or three feet thick for the outside of stores and three or four inches for dwelling houses, as they thought this was the best material to resist fire. They conceived some faint idea of technic principles, but still there was no perfect building accomplished with the technic principles, æsthetic principle and phonetic adjuncts. They had no idea how to fulfill the union of all technic principles, such as mass, stability, durability, material, construction, warming, ventilation, lighting, proportion, form and ornament.

Architecture as a technic art, is practical in the same progressive principle, as all its sister arts. It is hardly as individual as music, because its forms and colors are permanent and capable of being repeated, with such improvements as each experiment suggests, in every subsequent building, but when it attempts the phonetic form of utterance, these are seldom so absolutely integral that they cannot be separated from the building and judge of a part. A Greek temple or a mediæval cathedral without painting and sculpture, may be poor and inanimate but still so

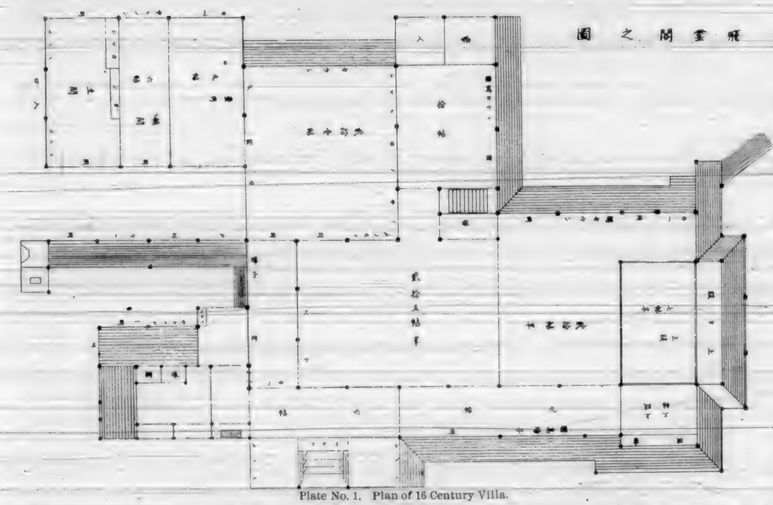


Plate No. 1. Plan of 16 Century Villa.

beautiful in its form, so grand in its mass and so imposing in its durability, that in its technic, æsthetic form alone, it may command our admiration, more perhaps than any other work of human hands except, of course, as said before, the highest intellectual form of phonetic art. In 1316 a very large edifice was built as a Public Library, to accomodate several hundred people. In 1397, a rich and powerful nobleman built a golden villa, finishing all parts with a thin gold coating. In 1587, a celebrated strong castle was built at Osaka, and it still remains there. In 1629, a great civil engineering work, or a long canal of about thirty miles, was constructed to convey pure water to the present capital, Tokio. This work gives a great happiness to the citizens, and some European engineers approve of it justly as a scientific idea. In 1650, a most splendid temple was built in Nickko. Its degree of painting and sculpture is so excellent that we cannot find such fine art in any other place; the building materials are said to have been sent from several parts of the country, and its construction appears to be extraordinarily complicated. Especially, the five-storied tower is considered to be constructed scientifically. It has a fine foundation, the large central post resting on a large granite stone mass and is balanced but not fixed rigidly. This is the most costly building in Japan. The number of gates and temples at Nickko is about twenty, and the annual number of visitors exceeds 100,000.

In 1790, a great building was erected as a seminary. In 1852, a massive and strong fortification was built in the Gulf of Tokio.

The Japanese took pleasure in building temples and churches, and in ornamenting them with painting and sculpture. Year by year they increase in number. At present the number of temples exceeds a third of a million, and there are about 72,000 churches. They appear to understand a great and noble want in human nature, "the love of beauty."

Generally, architectural style is influenced by many reasons, namely:

1st. By material.
2nd. By climate.
3rd. By natural character.
4th. By natural growth.
5th. By fashion.
6th. By conquest.
7th. By commerce, and
8th, or lastly, by alliance.

In 1860, as soon as the port of Yokohama, Japan, was unlocked for commerce with other civilized nations, bricks began to be manufactured—cement being imported. Stores and houses of brick became fashionable. So, suddenly, was architecture introduced and the port of Yokohama changed month by month to foreign styles, and at present about one-third of the buildings are of foreign styles. In 1868, the Emperor moved into the new castle at the present capital, Tokio, from the old capital, Kyoto. In 1873 there was a great fire in Tokio, and the castle was destroyed. Brick buildings were introduced in Tokio from Yokohama, and the central part of the Kyobashi district is occupied with foreign brick buildings; beside those, twenty private residences and seventy public buildings are built now.

As I told you, the progress of architecture was very slow until the Japanese began the business of commerce with the Americans and Europeans, who informed us of scientific theories and interesting practices, and at present every matter is going on at the full speed of progress. Thus, the length of railways exceeds 1,400 miles, the length of telegraph lines is about 70,000 miles; letters through the post office amount to 120,000,000; number of ships, above 500 tons, is 69; and a half ton of gold, 3 tons of silver, 1 ton of copper, 2 tons of iron, a quarter of a ton of lead and 1,000 tons of coal were obtained from the several mining districts; but the number of mining districts will increase from the influence of earthquakes, which cause physical and chemical communication between the elements by cracking the interior beds of the earth. The number of prisons was 195, and the number of prisoners 72,000; number of schools was 25,000, and the number of students was 3,000,000 last year.

There will be a summary description of Japanese architecture. Electrical and civil engineering works of America are already introduced in Japan but architectural designing, which gives a

great influence to social progress, has not yet been introduced, although some ornamental styles and constructions have been introduced from Europe, and building expenditure being too dear for Japanese and it is not yet in fashion; hence, I have an idea to introduce only the plan for room accommodations at first, which is a good way to teach formal manners, or civilized customs of living and to wash away the native habits. In Japan, two-thirds of the total number of inhabitants live very miserably in only one or two rooms, which are used as sitting, working, dining, sleeping and cooking rooms; and, moreover, the ceilings of the rooms are only 6 or 7 feet above the floor.

The plan of civilized living and business is the most important to introduce, because the architectural style of the rich American is very unsuitable for the poor people in Japan. (I should like to study some method of building to resist earthquakes, as they are very frequent in Japan.) My purpose is to obtain the best plan of civilized living and business. With this simple but important object, I am about to spend my young life in Europe and America, for five years or more. My object in thus addressing you is only my desire to get your good advice relating to the plan.

NOTES & COMMENTS.

A committee of the Brickmakers Convention held lately in Philadelphia, recommended that the standard size of a good, hard, common brick be $8\frac{1}{4}$x4x2$\frac{3}{4}$ inches; that the standard size of a pressed brick be $8\frac{3}{8}$x4$\frac{1}{8}$x2$\frac{3}{8}$ inches. The statement was made by one member and denied by another, that a hard, burnt brick would take up more water than a salmon brick. Which statement is correct?

As many persons, nowadays dabble more or less with outdoor photography, the following information has an especial interest at this time of the year, and may account for many failures and disappointments where a different result was expected. At Berlin, Bunsen found that the chemical power of light, from noon to evening, varied at different seasons of the year as follows, expressed in degrees:

	12-	1-	2-	3-	4-	5-	6-	7–8 hour.
June 20,	35–	38–	38–	37–	35–	35–	24–	14–6 degree.
Dec. 21,	20–	18–	15–	9–	0			"

This shows a weak, actinic action during the winter season.

Judging by the aptness of the following clipping from Bill Nye's weekly letter, he must have had the streets of San Francisco in mind,—he says:—

"Show me the nation that has asphaltum pavements and honored wives and mothers, and I will show you the nation that thinks and progresses; show me the people who try to do business over cobble stones and woo their wives in the tumult of a stone paved street and I will show you a people who cannot think unless they have a roll of cotton in each ear."

The recent great fire in Boston is believed to have been caused by the falling of an electric-light wire, which thus came in contact with a wire used in transmitting electric-clock signals. There exists in Massachusetts a special statute providing that railway companies shall pay all damages occasioned by fires kindled by sparks from their locomotives, and under this statute the Fitchburg Railroad Company has just been obliged to pay two hundred and fifty thousand dollars for loss and damages caused by a spark. *The American Architect and Building News* makes the sensible suggestion that the statute might be extended to make electric-light companies similarly responsible for damage caused by their wires.

The rotary steam plow lately tested in the presence of several prominent Southern Pacific officials, showed a highly satisfactory result, clearing a quarter of a mile of track near Truckee of a depth of sixteen feet of snow, in the space of forty minutes.

It is hoped this experience will do away with the necessity of maintaining the forty miles of snow sheds now protecting the track of the Central Pacific Railroad, where it crosses the summit of the Sierras. Although the existing sheds will be allowed to remain until destroyed by fire or become dangerous through old age, their ultimate removal will be a boon to the traveler who desires to enjoy the wonderful scenery of these mountains, now hidden from his view in so tantalizing a manner.

The sheds as they now exist were erected at an expense of two million dollars, contain sixty-five million feet of lumber, and have cost large sums for maintainance and repairs.

Edward Atkinson has a very interesting letter in the *American Architect* of Dec. 21st. on the Boston Fire, which is intended to enlighten the public mind on the matter of "slow burning" buildings. It had been intimated that the well-known Ames building in that city—the second to succumb to the fire—was of slow burning construction. This Mr. Atkinson denies and says it was not "any sort" of a slow burning building. He then proceeds to tell how he would erect a building under conditions like the Ames', making it a "slow" burner, and a safe-guard to the neighborhood.

Mr. Atkinson charges owners and occupants of new buildings with caring more for meretricious art than their own or the public safety. He says commercial buildings may be constructed consistently with the rules of safety—at as low a cost, if not lower, than the sums which have been expended in the construction of conspicuous examples of *combustible* architecture. "It is doubtless desirable that art should be a principal motive in architecture; but is not art misplaced when applied in such buildings as the Ames building under the conditions of the surrounding neighborhood; was not Hunt's genius misapplied when he put his pictures upon the unstable walls of the Capitol of Albany."

PERSONAL.

Mr. Seth Babson has removed his office from the Phelan Building to 408 California St., same location as the office of this journal.

Mr. A. C. Lutgens has removed his office from 121 Post St., to 935 Market St.

Mr. W. W. Goodrich late of Oakland has located in Atlanta, Ga. We notice his article in the *Architects', Builders' and Hardware Journal* upon "Sanitation."

ILLUSTRATIONS

Plate No. 1 shows the plan of a Japanese country villa of the sixteenth century and on Plate No. 2 will be found the elevation of this villa, and also the plan, elevation and section of a summer house in the style of a century later; they are to illustrate the paper on Japanese architecture by Mr. Shimoda. In our next number we will produce the drawings of a temple and the details of its construction.

Plates Nos. 3, 4, 5 and 6 illustrate very fully a handsome residence designed by Samuel Newsom, architect.

In our next number we will produce the drawings of a temple and the details of its construction.

MECHANICS' LIENS DECISION.

ARCHITECT VS. OWNER.

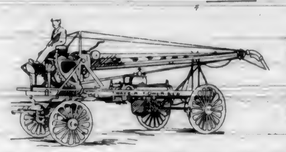
R. B. Young, an architect of Los Angeles, recently recovered judgment for services rendered in erecting a building for F. C. Howes of that city. After the completion of the building mechanics' liens were filed on the property and the owner considering the architect responsible for their payment refused to pay him a portion of his fees corresponding to the amount of the liens. In making the charge to the jury Judge Wade spoke as follows upon points interesting to architects:

The matter for you to consider in this connection is: First, what kind or class of a building was the plaintiff instructed by the defendant to prepare plans and specifications for. This you must determine from the evidence. Second, was the work as superintended and directed by the plaintiff done according to those plans and specifications when they were prepared. If they were not prepared as directed by defendant—that is, if the plans and specifications for the building were not for such a building as defendant wanted then plaintiff has been negligent or remiss in his duty. This would be a good defense to his action to recover the value of his services; and it also would support the defendant's first cause of action set out in the cross complaint, in so far as defendant was damaged by any failure of duty by plaintiff on that account. If, on the other hand, you find that plaintiff did prepare the plans and specifications for a building such as he was directed to prepare by defendant, of the class of building and kind of building that defendant wanted, but that in superintending the construction of it he was so careless and negligent as to suffer improper materials or improper workmanship to enter into the building, whereby it was damaged and rendered less valuable than it otherwise would have been if done according to the plans and specifications—in other words, if he failed to superintend and direct the construction of the building according to the plans and specifications, then that would be negligence on his part for which the defendant could recover the amount that defendant would be damaged by such failure.

The next thing for you to take into consideration is defendant's second cause of action, set out in his cross complaint. That is, that plaintiff undertook and agreed as a part of his employment as architect for the construction of the building on Main and Upper Main street, to prepare and file for record the two contracts or either of the contracts. Now, it is the primary duty of either the owner of the building or the party with whom he contracts as principal contractor, to file the contract, if in writing, and if the amount is over $1,000 it is required to be in writing, and it is the duty of either one, and of one as much as the other, to file this contract for record; that is, it is the duty of the owner of the building (in this case Mr. Howes) or the contractor (in this case Mr. Lane). It was the duty of either one or the other, and as much the duty of one as the other to file the instrument for record. The reason is this: That in the event of its not being filed for record it becomes void and neither party to the contract—that is, in this case, neither Howes or Lane could recover anything on the contract. Lane could not recover for the work done and material furnished by him from Howes; nor could Howes recover from Lane for any failure on his part to carry out the contract according to its terms and conditions. In order that it might have become the duty of the architect in this case to file this contract, it should appear from the evidence either that he expressly agreed with the defendant to file it for record, or that he promised under such circumstances to file the instrument for record, and that Mr. Howes relied upon him, and was unable under the circumstances to do so, or prevented by the plaintiff's undertaking that duty from doing it himself, or you would have to find from the evidence that that was a part of the necessary duty of the architect of the building to file a contract of this kind for record. There is absolutely no evidence upon the later point in this case—no evidence or any testimony tending to prove any such duty as being necessarily incumbent upon the architect by virtue of his calling. It is not sufficient for this purpose to prove merely that it was the custom or the habit of the plaintiff to file such contracts when they were left with him, unless you further find from the evidence that he had communicated a knowledge of that custom aud habit to the defendant in such a way as to induce the defendant to rely upon his doing it, and by such reliance being prevented from doing it himself.

If a contract of this kind is not filed for record, it becomes void as between the original contractor and the owner of the building and material-men—that is, men furnishing the material for the building and laborers and sub-contractors performing work on the building. The contract should be filed for record before the building is commenced or it is void. If this contract is not filed for record, the laborers and material-men and the sub-contractors may treat the owner precisely as though they had contracted originally with him, and hold the property liable to them for the whole amount of material furnished and the labor performed by them independent of the amount agreed upon in the contract, although it amounts in the aggregate to a great deal more than originally contracted for.

SAN FRANCISCO'S NEW WATER TOWER.



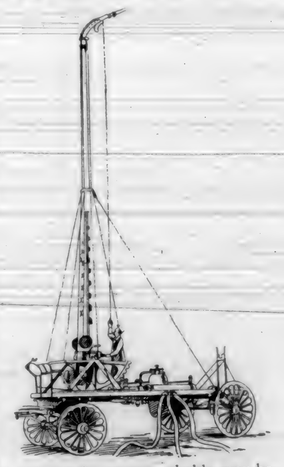
Few people who have read the demand of the Fire Department for a "water-tower" know what such a machine is, and its efficacy.

The Hale water-tower ordered by the Supervisors will cost $4,000 and will be ready for delivery in this city in ninety days, being the third machine built by the manufacturers.

It consists of a strong oak framework, mounted on wheels, carrying an iron frame with an extending telescopic tube, through which passes the hose conducting the water from the supply to and through the pipe to the top end or nozzle. The tube, which in the instance of the tower ordered for this city is fifty-five feet in elevation, is raised to the perpendicular by charging a small chemical engine which is a portion of the machinery. This engine has a lifting power of from 10,000 to 20,000 pounds.

On the end of the tower is a small turn-table, revolved by gearing, and attached to this are two wrought-iron arms which are connected with a nozzle two inches in diameter. The turn-table is operated by a cast steel rod running to the base of the tower, turned by a small wheel, and this directs the stream in any direction desired.

The raising of the tower is controlled by a wire cable and snubbing block in connection with the power used by the engine.



On both sides of the machine at the bottom are Siamese connections capable of being coupled to six hose lines, which, in their turn, are connected with the ordinary fire engines. The engines pump into the tower at the same time and the united stream issues from the nozzle at the top of the tower with tremendous force.

At a test at Detroit recently two engines supplied the water through four lines of hose at a pressure of 265 pounds, and the water was thrown from the nozzle a distance of 320 feet perpendicularly, or high enough to be thrown over the highest building in that city.

The benefits of the tower are many. A building heavily charged with smoke and utterly unapproachable may be flooded from across the street. It is useful in lumber-yard fires and will wet an area of 400 feet in diameter at one setting. It requires but two men to work it and may be used at such a distance from a fire as to be free from the danger of falling walls.—*S. F. Examiner*, January 2, 1890.

The recent destruction by fire of the Girls' High School is another evidence of the danger of so many large frame buildings crowded together in our large city.

PROFESSIONAL CONQUEST.*

There is a field for professional conquest in view. Its acquirement will be fraught with perplexities and difficulties. Its occupation is imperative, if the architecture of this country shall soon be up to a creditable standard of merit. The building enterprises of the country, so far as all work of a public character is concerned, are in the hands of, and directed by persons who have no special qualifications to determine either what should be built, or how it should be done. When a building is to be erected, instead of its being the custom to have it controlled by architects of the country, or by some persons skilled in building matters, it is usually put in the hands of a board or committee from which all architects are carefully excluded.

To introduce a different practice, and by this means make it possible to eliminate the faulty, systematize, harmonize and improve upon the meritorious in our public architecture, is a field for professional conquest. It is a field worthy of our best efforts to control. It can be gained only by sacrifices commensuate with the importance of the expected result.

Designs for buildings are secured either by competition or otherwise. For the present and likely for many years of the future, a considerable share of our public buildings will begin their career through competition of one kind or another. As now conducted competitions are not only not conducive to the highest achievement in the architectural sense, but are an incubus upon the profession. The excuse for keeping up the practice is two-fold: first, to give everybody a chance, to afford the younger members of the profession opportunities to measure arms with those of greater experience and reputation: second, to obtain for a given building the best possible design. As to the first, the profession will not object to a decrease in the number and an elevation of their standard. As to the second, conducted as they are, the object sought is not attained. The chance to select a better design than any given one obtained without competition, is lost by reason of the fact that the average commission which makes the selection is not qualified to determine which design should be selected. I speak, of course, of the great number of competitors which constitute the rule, not of the few exceptions where experts are called in and designs submitted under a nom-de-plume. I think it is fair to say, as a rule, that if the best design in a given lot submitted be adopted, it is an accident rather than a likelihood. The buildings for which designs are obtained by giving commissions direct, to a certain extent escape objectionable results of competitions inasmuch as there is usually free and full interchange of thought between the architect and those in charge, and by means of this, the architect has a more favorable opportunity to control the whole character of the enterprise than where its general outlines have been made up as a target for the competing designers to shoot at.

The whole system of placing the management and direction of our buildings in the hands of persons who possess no special qualifications for it, whether they obtain designs by competition or otherwise, is a mistake. It is a wrong against the public itself, which we are professionally bound to right as soon as we can reach the ear of those who control such matters. The average board or commission is made up of intelligent men in other lines of vocation, and if called upon to decide anything in relation to their own business could do so with a fair prospect of having it properly and correctly done. But when a plan for a building comes before them, no one of an average board can tell whether a building erected after the plan would please him or whether it ought to please him. No one of them could tell whether it is probably the best thing which can be done or not, —and no one could tell, if it was the price of his eternal salvation, whether a building erected after the plans under examination, would stand up or fall down. To say that this is ridiculous is to characterize it in terms entirely too mild. What commission anywhere without legal talent would undertake to decide a question of law? What board without obtaining a physician would be willing to decide a question of medical jurisprudence? What commission without a musician, would undertake to decide whether a piece of music had been rendered perfectly or not?

What man anywhere would be willing to either give or accept such authority, and with it the responsibility in any of these matters? How different the whole face of affairs when you come to the subject of architecture. The public believes it necessary to grant, and those selected think it proper to accept, such responsibility. The result is what would be inevitable if the same lack of business sense should be exercised in any other direction. If you answer that these boards either by competition or otherwise, engage an architect, and trust to him and depend on his ability and judgment, then I will ask you, what is the use of the Board? Why interest a commission with something everybody knows it knows nothing about, instead of putting it in the hands of people who could reasonably be expected to understand what was before them? If there is any use of having anybody but the architect to rule over the matter there is use in having somebody who can be an aid to him instead of a hindrance. If, in order to have done the best thing which can be done, it is necessary to procure assistance for the architect, it is certainly proper to have such assistance possessed of some idea of what should be done, and what a given plan and specification will bring out when carried into execution.

It may be claimed that the architect does control the whole matter so far as the builder is concerned, that the board or committee is only expected to attend to the formalities and the business part of the work. I dare say that in some few instances this is true. If it was always true, one of the objections to the present system would be removed, such cases are rarities, by no means the rule, when the architect is left free to use his best judgment in all things pertaining to the building. If in all cases of competition the designs were selected by a board of competent experts, and where an architect is employed his design should be his own, not that which will please the committee, much of the harm would be avoided. But even then, the benefit of intelligent counsel and advice which would be valuable to the greatest architect in the country and still more valuable to the younger members of the profession—would be lost. No man anywhere is so omniscient that his work would not be better for the criticism of a board of men of his *own* profession, even though something less than himself in ability. This would be gained under the system I suggest. Upon the other hand the work of the weakest member of the profession is not likely to be improved by the suggestions of the average board. This contrast measures the difference between the present system and the state of affairs after this field shall be won. Again, in the last twenty years much has been done to unshackle the hand of the designers, but this same unloosing of bands turns him into a field chaotic with historic design which is to supplement and guide his invention in the work of the future.

One of us gleans from fields of certain ideas; another, other ideas; another, still other ideas, each following a tangent for himself; some learning better than others, but nobody learning so much as all.

If we are to have a national style these lines of divergence must be brought to a parallel; the simply odd, the uselessly picturesque, the servility of copyism and the sterility of unstudied crudeness, from the work of each, such must be excluded.

Our work must tend toward a crystallization of the best to be found or invented. If this be true I know of no one thing which would be a more potent agency in its accomplishment than the adoption of this plan.

The use of boards instead of individual experts and counsellors will broaden criticism, give decisions a greater weight of authority and rid them of any supposed bias in favor of, or against any particular style.

The one great fact that the final authority as to what shall be done on our public-building enterprises is left to such persons as now control them, accounts to a very large extent for the blunders committed and accounts for the fact that the grade of our public architecture is not up to what it should be. So long as it remains in such hands it can never occupy that position in relation to the architecture of other countries to which it is entitled. I take it as indisputable in the interest of our profession —the interest of architecture of the country and the interest of the general public that a great change is desirable in this whole matter. But how can it be brought about? All may recognize that we are in the woods, but who knows of a pathway that leads to the sunshine? All can recognize the great work to be done, but who is able to cope with difficulties we shall encounter in doing it? The present system is strongly entrenched in public favor. No matter how willing a public official may be to acknowledge his inability, he is immediately offended if some one suggests that a professional adviser be called in, and if he should even consent to that, he is quite sure to have it understood that it is only *advice* and not final *judgment* which he accepts.

An architect going into competition will ordinarily greatly jeopardize his chance of success by mentioning to a member of the board the fact that he would be glad to see the designs submitted to a board of experts for decision. There is much more than merely the question of deciding which of a given number of plans shall be accepted which should not be in the hands of boards without education in matters of architecture. The control and management of the entire enterprise, everything that is included in the words "How to build, when to build, what to build," should be left to the control of the profession entirely, not merely submitted to them for advice and clerical services. The idea of an architect preparing plans for a commission of architects and submitting plans in competition for a board of architects to decide upon, may be a new idea, but it is a good one nevertheless.

If an important building enterprise, it is necessary to have an architect of skill and ability, it is by no means improper to have the value of his services supplemented by the advice of men who know as much about what is to be done as he does. It is written that "In a multitude of counsel there is wisdom," and matters of architecture were not excepted from the law. When we undertake to improve upon the present practice we are at once confronted with difficulties.

The matter of expense must be taken into account, boards of professional men who make their living by their calling are not likely to render services such as described, without just compensation. The public is just beginning to appreciate the fact that the five per cent. paid for the service of an architect is money well expended, but it will take some little time to bring the public to believe, that two or three per cent more can be paid out to advantage in securing the service of such boards as I have described. We must establish the fact that this additional expenditure is, after all, a great economy, before the public will be likely to accept it. That it will result in not only bettering the architecture but actually saving money, is as clear as anything need be, when all the facts are considered. It will, however, take some money out of public officials who heretofore have acted in charge of building matters, and they will seriously object to having it done.

I see, however, no insurmountable difficulties in either of these directions. We have brought the public up to believe, and that within the space of a few years, that their interests are best subserved by employing a competent architect, even in small enterprises, and in less time we could demonstrate the economy of the practice I have suggested, and through the pocket-nerve of the public, could compel officials to accept the situation. There are, of course, boards in charge of new buildings who render their services, such as they are, without hope of financial reward, but even then it would be entirely within the range of possibility, even probability, that a board of competent persons could save in the actual cost of the building, to say nothing of its value when once erected, much more than the probable two per cent., which their services would cost. But how are such boards to be found? Who is to select them and who shall be ready to serve when requested? At first the question seems difficult, and, in the present state of our profession, next to impossible, to answer. But we are not at a "stand still." Every demand for such service would in a few years be abundantly met. If you ask me now to name the persons who shall serve in this capacity, I am not able to answer you. I think it must be frankly admitted that at this time there is no set of men specially qualified for and desiring to hold such situations, but open the way for such work and the time will be short until the supply will be equal to all demands. It will be impossible now to lay out any plan for carrying these ideas into effect which shall not have to be altered to meet future requirements as experience develops them. I think no man is wise enough now to foresee all the difficulties, which might arise in undertaking to substitute professional for non-professional authorities in building matters. Judging by the experience of the past it will be some years before we could perfectly carry out the reform. But we are growing in that direction.

I know that we have no national style of architecture, no complete harmonizing of views as to what direction the detail in our design should take. I know we have had too little personal affiliation with, and too little friendship for each other, particularly in the newer portions of the country. I know we are unmerciful critics of each other's work—of everything not in accordance with our individual ideas or the vogue of the time. But for all that we are fast becoming less biased in our judgment and more reasonable in our treatment of each other and of each other's work. We are rapidly approaching a toleration of differences of opinion. We are speedily coming to realize the fact that if we have no respect for each other and the work of each other, the general public will have still less for all of us. Some of us may not take kindly to criticism; others may be disposed to resent the criticism of a professional board as an intrusion upon the "sanctum sanctorum" of the designer. Some of us may prefer to be allowed to convince an ignorant committee of the superiority of our ideas, some of us may not think any one else ought to have the impudence to make a suggestion in regard to what we have in hand, but all these cases will be rare, and as criticism becomes more intelligent and the members of the profession are brought up to entertain a better feeling for each other, they will practically disappear. As we become better educated and more skillful in our own work, we will be still more able to recognize merit in the work of our brethren. When we shall possess sufficient professional patriotism to see our highest personal advantages in the greatest possible improvement in the architecture of our country, a foundation will be laid upon which we can build our work and ourselves up to the standard of the old masters.

* A paper read by J. W. Yost, architect, Columbus, Ohio, before the Convention of the American Institute of Architects, at Cincinnati, Nov. 21, 1889.

A Treatise on Masonry Construction containing materials and methods of testing strength, etc., *Combination of Materials* —composition, etc., *Foundations*—Testing the bearing of soils, etc., *Masonry Structure*—Stability against sliding, overturning, crushing, etc., etc., complete in one volume of 500 pages, with 125 illustrations and eight or ten folding plate, by Ira O. Baker, C. E.; 8vo. cloth, $5.00.

This work is the outgrowth of the author's own class-room, and is now published with the belief that it will benefit others. A careful review of this book gives evidence that it should be in the hands of *all* who are interested in masonry construction. [If the parties engaged in constructing the caisson at the foot of Market Street had known more of the contents of this work, they would not have blundered as they have done. Ed.] A large amount of practical details are presented and all the data have been verified. The work has been divided into four parts, viz: Description and characteristics of the materials, Methods of preparing and using materials, Foundation, and Masonry structures, and contains six plates, giving detailed plans of Caisson Havre de Grace Bridge and of various arch, semi-circular and segmental arches, etc.

If you are searching for the best work on masonry construction, order this publication of John Wiley & Sons, 15 Astor Place, New York.

Knowing that those who desire to obtain the most important articles upon the leading topics relating to architectural pursuits read this column in order to know what periodicals to purchase it has seemed expedient to continue it.

American Architect, Dec. 7th, "Sanitary Disposition of the Dead," "A System of Concentrated Residences," "Domes and Towers." Dec. 14th "Mills and Mill Engineering." Dec. 21, "Is Mexico's Greatest Painting a Titian?" Dec. 28th, Letters from Different Cities of the World. Jan. 4, "Architecture in Brooklyn, "The Structure of Sandstone as Affecting Architectural and Engineering Works," "The Apartment House," "The Barye Exhibition."

Building, Dec. 7, "The Hundred Masterpieces." Dec. 14, Willard Architectural Commission. Dec. 21, "Unsanitary Buildings of Suburban London, "False Economy for the Health Department;" Building Sketch Club Competition No. 4. Dec. 28, "Angular and Terminal Features." A change of name takes place with the number of January 7, and that which bore the name of *Building* is now *Architecture and Building*. Contents: "Architectural By-ways," Architectural League Exhibition, "Architectural Engineering."

Inland Architect, December, "Romanesque Architecture," "Developement of Architectural Style," "Architecture in the West."

Canadian Architect, December, "Convention Ontario Association of Architects."

Architectural Era, December, "Romanesque Architecture," "Licensing Architect," etc.

Dec. 28, "Bridgeport Macadam Roads." Jan. 4, "Wiring Buildings for the Electric Light," "Much Money in Bath Rooms," "Mistake of Sometimes Accepting Lowest Bid."

Architects, Builders and Hardware Journal, Atlanta, Ga., "Letters on Architecture," "Sanitation" and "Ventilation."

THE AMERICAN STYLE.

The December *Atlantic Monthly* contains from the pen of architect Henry Van Brunt of Kansas City, one of the ablest articles on *American* architecture we have ever had the pleasure to peruse. It should be published in full, but our space does not permit. The article is calculated to outline to the reader the much talked of "*American*" style of architecture yet to come.

The writer says:

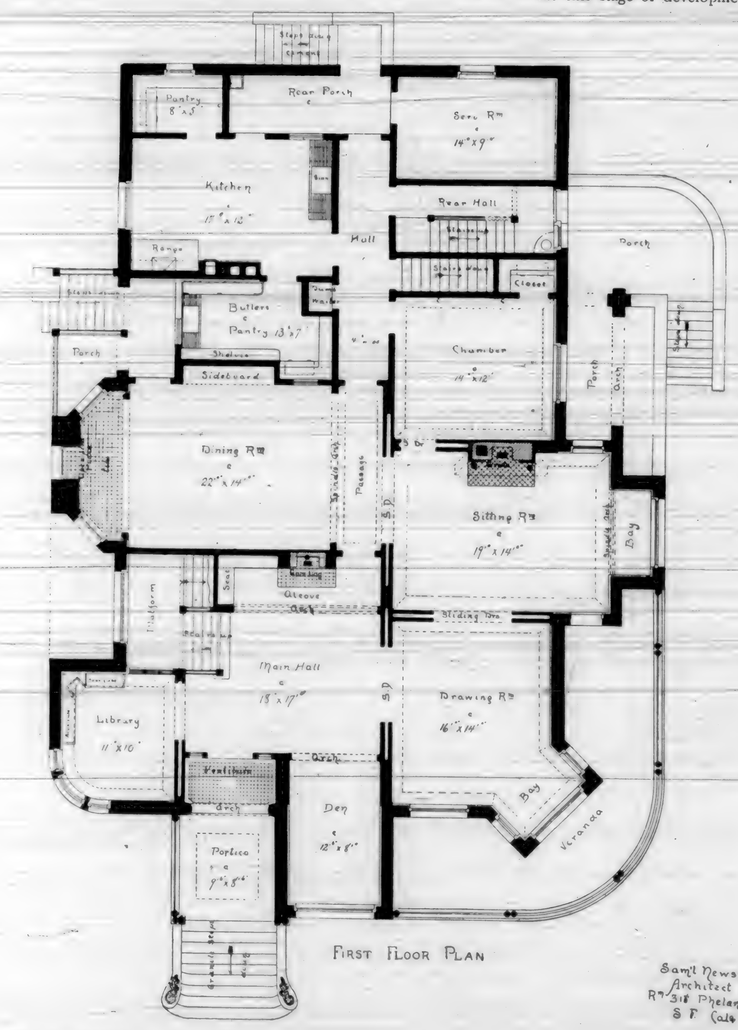
"Civilization is advancing into the West like a brimming and irresistable tide that knows no ebb. It has planted cities and established civil order upon virgin soil in less than thirty days, and the first settlers are comfortably housed in a week. The first business structures have value only as make-shifts. * * *

"At this stage of development, the natural desire of every citizen to own property of the best possible appearance, at the lowest possible cost, leads to what may be called an architecture of pretense—an architecture to appear *better than it is*. This style of architecture has met for years, and will meet probably for many more, all the practical requirements, and has flattered the crude artistic aspirations of a prosperous people. It must therefore be respectfully considered as, at present, the *vernacular* art of the country. Nowhere else in the civilized world can be found anything like it. It is peculiar. It is ours."

"I have called this an architecture of pretense because of its ambition and its desire to make a vain show with small means. The facility with which wood and galvanized iron may be molded, painted and sanded to imitate stone or other nobler materials, makes this baleful process possible. The *vernacular* style has still undisputed sway, and in the hands of uneducated builders plays with these dangerously facile materials such fantastic tricks before high Heaven as make the angels weep.

* * * *

After a few years the paint wears off, the wooden sham begins to decay, and the galvanized iron to betray its hollow mockeries. The *vernacular* style has within itself the seeds of its own dissolution.



FIRST FLOOR PLAN

Plate No. 6.

BUILDING LAWS IN NEW YORK CITY.

It is proposed to revise the Building Laws regulating constructions in New York City and a public invitation has been extended to all interested persons to submit suggestions for modifications. The following is an extract from *Building:*

One of the ideas advanced, which will meet with the hearty approval of every architect doing business in the city, was that the Building Department should be made independent of the Fire Department. There is too much politics to the square inch in that department for the healthy transaction of business. The Superintendent of buildings should be a civil engineer by training and education, thoroughly versed in architectural engineering, but he should have in his department a Deputy Chief Superintendent, whose training and education had been that of an architect; in other words, to decide any questions under the Building Law, requires a man, or two men of the very highest order of scientific and artistic attainments. No architect should be obliged to sacrifice some architectural feature of vast importance to his design, simply because it does not conform to the antiquated requirements of a building law, which was devised and drawn up at a time when there was no demand for such design, and, secondly, be interpreted to-day by men who do not know what architectural design is. It actually needs two highly trained orders of intelligence to administer the present law in a spirit of fairness to the architect and safety to the public.

It is quite true that no law can be passed that will cover every point that arises, as new ideas in the shape of not only new materials, but new methods of construction are being continually advanced by architects, engineers and builders. More discretionary power should be left with the Superintendent than is now left to the Board of Examiners. * * * * *

In view of the many inconsistencies of the present law, and the impossibility of amending them without producing more misunderstanding and confusion than now exists, it would appear that the wisest thing to do would be to have a committee appointed from the American Institute of Architects, the Master Builders' Association, the Institute of Civil Engineers, Mechanical Engineers, Electrical Engineers, the Master Plumbers' Association, the Board of Underwriters, the Real Estate Board, the Board of Health, and the present Building Bureau, to draft a new set of laws and petition the Legislature to enact them, and abolish the old. A committee from these bodies would produce something clear, tangible and worthy of confidence.

IMPORTANCE OF VENTILATION.

In order to enjoy life and health, it is necessary to eat pure wholesome food, and drink pure water—it is of still greater importance to *breathe fresh air.*

In fact few realize its vital importance: for while life can be supported for days without food and drink, a few minutes without air is fatal. How quick the death resulting from a failure in the supply of oxygen to the lungs was clearly shown last month by the death of two unfortunate gentlemen who lost their lives by venturing into the hold of the ship *Durham*, and the very narrow escape of their companion.

People who are most careful in the selection of their food are not always as thoughtful in regard to the air they breathe, though the latter point is not a whit less important than the former.

The following extract is from a letter written by a local physician to the editor of an evening paper:

"It is indeed time that the people should arouse themselves and be made aware that a large amount of sickness is entirely avoidable if people would live in houses that were properly ventilated. I am fully satisfied that the average rate of mortality would be materially decreased if there were a law which required and compelled the adequate and proper ventilation of our schools, public assembly halls and churches."

The Doctor's views are correct, and as "an ounce of prevention is worth a pound of cure", let the people look to it that they get an abundance of fresh air. It will make them healthier, happier and more rugged than those who are forced to inhale impure air, or that long confined in close rooms. Let them see that the chambers they sleep in and the rooms they work in are properly ventilated, and ventilated in such a manner as not to need constant attention to prevent draughts and currents of cold air, though means, of course, should be provided to regulate the amount of new air requisite, which will vary with the number of occupants and other causes. How many lives lost through carelessness in shutting off the gas might have been saved had the room been so ventilated as to remove the dangerous gas and substitute a supply of air.

PAINTER.—Thoroughly competent, accustomed to management of men, desires to *take charge of Painting for large Builder or Architect.* Address PAINTER, "Architect" Office.

CITY BUILDING NEWS.

Bluxome and Fifth. Brick and carpenter work for brick warehouse; owner, Mary E. Von Schroeder; architect, T. J. WELSH; contractor, Thos. H. Day; signed, Dec. 14; filed, Dec. 20; cost, $10,700; time, 72 days; payments, 75 per cent. monthly as work progresses; balance, 35 days. Tinning and galvanizing; time, 15 days; contractor, Wm. Cronan; filed, Dec. 20; cost, $3,196; surety for $1 500, Geo. Duffy. Grading and brick work; sub-contractors for Thos. H. Day, Riley & Loane; filed, Dec. 21; cost, $9,700; payments, same as other contracts.

Buchanan and Vallejo. To build except plumbing; owner, H. F. Woods; architect, Wm. F. Smith; contractor, W. N. Concannon; signed, Dec. 19; filed, Dec. 21; cost, $7,080; payments, $1,327.50, framed; $1,327.50, ready to lath; $1,327.50, plaster on; $1,327.50, completed; $1,770, 35 days.

Buchanan and Broadway. Plumbing and gasfitting, five houses; owner, John Hincke; contractor, Geo. Humphreys; signed, Dec. 14; filed, Dec. 17; cost, $2,350; payments, $587, first three houses roofed in; $587.50, remaining houses roofed in; $587.50, first three houses completed; balance, 35 days.

Castro and Jersey. Six-room dwelling; owner, J. A. Remmel; architect, M. A. Stenbilt; contractor, John J. Boyle; sureties, H. R. Lewis and R. Harvey, $2,000; cost, $2,000; signed, Dec. 17; filed, Dec. 21; payments, $750, brown coated; $750, completed; $500, 35 days.

Douglas and Twenty-fifth. 1-story frame; owner, Sarah Zammett; architect, T. W. McKee; contractors, M. Caikley, et al; cost, $1,200; signed, Dec. 10; filed, Dec. 13; payments, $275, enclosed; $275, brown mortared; $300, completed; $350, 35 days.

Front and California. Passenger elevator; owner, Moses Rosenbaum; contractors, W. H. Birch & Co.; cost, $3,-825; time, Feb. 1, '90; signed, Dec. 10; payments, 75 per cent. as work progresses; balance, 35 days.

Gough, between Post and Sutter. Brick, carpenter work, etc.; owner, Samuel Weitz; architects, Salfield & Kohlberg; contractors, Fuchs & Bucher; sureties, F. Krueckel and G. H. Woerz, $9,400; signed, Dec. 6; filed, Dec. 17; cost, $9,400; time, 110 days; payments, $1,000, basement up; $2,000, enclosed; $2,000, partitions set; $2,050, accepted; $2,350, 35 or 60 days. Plumbing, gasfitting, etc.; contractors, S. Ickelheimer & Bros.; signed, Dec. 16; filed, Dec. 17; cost, $820; payments, $400, gasfitting done; $210, accepted; $205, 60 days. Painting and graining; contractor, Otto Schultz; cost, $525; signed and filed, Dec. 17; payments, $200, paint ready to grain; $175, accepted; $150, 60 days.

Grove and Van Ness Avenue. Plumbing, etc.; owner, Isaac Harris; contractor, R. R. Thornton; cost, $1,275; signed and filed, Dec. 24; paymenis, $400, brown mortared; $400, white mortar on; $475, completed.

Guerrero, between 24th and 25th. To build; time, Jan. 20, '90; owner, Ann Smith; contractors, Glover & Jones; sureties, S. E. Slade and C. A. Thayer, $400; signed, Nov. 29; filed, Dec. 17; cost, $1,375; payments, $900, first floor joints on; $250, enclosed; $269, brown coated; $200, plaster finished; $256, completed and bills paid, or 35 days.

Guerrero Fifthteenth. 2-story frame; owner, Nicholas Fuchs; architect, Henry Geilfuss; contractors, Tegeler & Mullen; cost, $6,346; payments, $966, framed; $966, partitions set; $966, brown coated; $966, white coated; $966, completed; $1,616, 35 days.

Guerrero and Twentieth. Grading; owner, D. W. Parkhurst; architect, A. J. Barnett; signed, Dec. 11; filed, Dec. 17; cost, $2,447.16; payments, 75 per cent. as work progresses at 42 per cent. per cubic foot, nothing for filling; balance, 35 days.

Powell and Price. To build; owner, Paolo Bacigalupi; architects, Salfield & Kohlberg; sureties, A. W. Starbird and Frank P. Latson, $6,800; signed, Dec. 13; filed, Dec. 17; cost, $6,800; payments, $1,200, frame up; $1,000, partitions set; $1,200, brown coated; $1,700, completed; $1,700, 35 days.

Jackson and Kearney. Alterations; owner, G. Dussol; architects, Pissis & Moore; contractors, Richardson & Gale; signed, Dec. 14; filed, Dec. 16; cost, $3,190 payments, $500; $700 with work done; $500, Jan. 1, 1890; $500, Feb. 1, 1890; $500, March 1, 1890; $500, April 1, 1890; balance, May 1, 1890.

Jackson and Devisadero. Frame; owner, A. E. Buckingham; architect, M. G. Bugbee; contractors, Ingerson & Gove; signed, Dec. 14; filed, Dec. 16; cost, $3,200; payments, $600, enclosed; $500, brown coated; $500, accepted; $900, 35 days.

Jackson between Webster and Fillmore. To build; time, 40 days; owners, Katie and Sarah Jacobs; architects, Salfield & Kohlberg; contractor, John T. Grant; signed, Dec. 11; filed, Dec. 17; cost, $1,340; payments, $1,000, completed; $340, 35 days.

Jackson and Van Ness Avenue. Plumbing, sewers, etc.; owner, Simon Wenban; architects, Pissis & Moore; contractors, Duffy Bros.; signed, Dec. 16; filed, Dec. 18; cost, $4,421; payments 75 per cent. as work progresses; balance, 35 days.

Market, Golden Gate Avenue, Taylor street. Grading, excavating, etc.; owner, Jas. A. Donohoe; architect, A. Page Brown; contractor, L. B. Sibley; signed and filed, Dec. 17; cost, $2,350; payments, installments, 1st and 15th of each month as work progresses; balance, 35 days.

Oak and Broderick. 2-story frame; owner, H. G. Wilson; architect, M. J. Welsh; contractor, L. Lariver; cost, $3,700; signed, Dec. 16; filed, Dec. 18; payments, $925, framed; $925, brown coated; $925, completed; $925, 35 days.

O'Farrell and Octavia. Alterations, etc.; owner, S. S. Smith; contractors, B. Pfarrer & Son; cost, $1,300; signed and filed Dec. 10; payments, $500, moved; $475 completed; balance, 35 days.

Pine and Jones. 3-story building; owner, Mrs. I. S. Allen; architect, Fred E. Wilcox; contractor, David Perry; sureties, W. B. Hill, $6,000; signed, Dec. 4; filed, Dec. 9; cost, $12,060; time, May 7, '90; payments, 75 per cent. as work progresses; balance, 35 days Party of second part to accept as part of last payment, lot N. Green street, near Hyde; amount to be allowed, $1,500.

Polk near Fulton. Raising and altering; owner, Delia Hasty; architect, M. J. Welsh; contractors, R. Doyle & Son; cost, $2,749; payments, $667, framed; $687, brown coated; $687, combleted; balance, 35 days; signed, Dec. 5; filed, Dec. 9.

Post and Baker. 2-story and basement framed; owner, Henrietta Fink; architects, John & Balczynski; contractor, F. L. Hansen; cost, $3,025; signed, Dec. 6; filed, Dec. 10; payments, $600, framed; $800, outside finish ready; $857, inside finish ready for painting; $760, 35 days.

Pine and Devisadero. 3-story frame; owner, Jos. Flatz; architects, John & Balczyniski; contractor, F. L. Hansen; cost, $4,350; signed, Nov. 27; filed, Dec. 11; payments, $400, framed; $800, roof on; $800, rough mortar on; $800, inside ready for painting; $1,100, 35 days.

Post and Taylor. 3-story frame; owner, John C. Coleman; architect, Geo. E. Voelkel; contractors, Jones & Glover; signed, Nov. 23; filed, Dec. 24; cost, $7,100; payments $400, frame up; $600, roof finned; $1,000, outside finish on; $625, plaster finished; $1,280, inside finish on; $1,500, completed; $1,775, 35 days.

Sacramento and Davis. Piling and capping; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor S. F. Contracting Co.; cost, $15,300; signed, Dec. 12; filed, Dec. 23; payments, 75 per cent. on 1st and 15th of each month; balance, 35 days. Brick work; contractor, John McCarthy; cost, $31,225; signed and filed, Dec. 23; payments, on 1st of every month, of 75 per cent. work done; balance, 35 days. Carpenter work. Contractor, W. M. Fletcher; signed and filed, Dec. 23; cost, $26,140; payments, on 1st of month of 75 per cent. work done; balance, 35 days.

Stockton and Vallejo. Owner, Robt. R. Hind; architects, Ashton & Stone; contractors, Faucher & Conner; signed and filed, Dec. 12; cost, $28,000 payments, 75 per cent. as work progresses; balance, 35 days.

Sutter and Taylor. Plumbing, etc.; owner, Isabella Levy; architects, Kenitzer & Kollofrath; contractor, R. A. Nunez; cost, $994; signed and filed, Dec. 13; surety, Joseph Budde; payments, $546, pipes in; $400, completed; $224, 35 days.

Sutter and Taylor. Brick work for 4-story frame; owner, Geo. Chisnore; architects, Chas. R. & J. M. Wilson; contractors, Breman & Flading; cost, $2,218; signed, Dec. 20; filed, Dec. 27; payments, $1,000, foundation walls up; $400, chimneys up; $168, completed; balance, 35 days. Carpenter work. Contractor, Winslow Hull; cost, $11,360; payments, 75 per cent. as work progresses; balance, 35 days. Plumbing and gasfitting, etc.; contractors, Sweeney & Kearns; cost, $1,797; payments, $675, rough work on; $672, completed; $450, 35 days. Lathing and plastering. Contractor, Alexander Neil; the cost, $1,686; payments, $618, brown coated; $618, completed; $412, 35 days.

Sutter and Taylor. Painting; owner, Isabella Levy; architects; Kenitzer & Kollofrath; contractors, Lynch & Armstrong; signed and filed, Dec. 17; cost, $785; surety, M. Nunan, $600; payments, $300, completed; $185, 35 days.

Washington near Steiner. 2-story frame; owner, Wm. Craig; architect, Chas. I. Havens; contractor, John Furness; signed, Dec. 8; filed, Dec. 26; cost, $6,870; payments, $1,250, rough frame up; $1,250, brown coated; $1,250; hard finished; $1,100, completed; $1,720, 35 days.

Washington and Kearny. Painting; owner, Louis Schultz; architect, Wm. Mooser; contractor, John S. Mellon; signed, Dec. 11; filed, Dec. 17; cost, $2,700; payments, 75 per cent. as work progresses; balance, 35 days.

Filling in earth; time, 60 days; owners, Boyd & Davis; architect, J. M. Curtis; contractor, Geo. Goodman; sureties, J. N. Taylor & Jeremiah Mahoney, $5,000; signed, Dec. 4; filed, Dec. 24; cost, $9,000; payments, 75 per cent. as work progresses; balance, 35 days.

Ellis from corner Powell to Buchanan and Post. Moving, etc.; 3-story house; owner, Fannie White; Architects, H. McDougal & Son; contractors, John Davis & Sons; signed, Dec. 21; filed, Dec. 30; cost, $1,200; payments, 75 per cent as work progresses; balance, 35 days.

Laguna and Turk. Plumbing, gasfitting; 3-story building; owner A. Legallet; architect, T. J. Welsh; contractors, Ford Bros.; signed and filed, Jan. 2; cost, $1,450; payments, $545, rough pipe in; $545, completed; $360, 35 days.

Linden Ave., No. 212. Alterations; owner, Mrs. E. Goldberg; contractor, John Martin; signed, Dec. 30; filed, Dec. 31; cost, $2,250; payments, $450, ready to lath; $450, brown coated; $450, while coated; $450, finished; $450, 35 days.

Lott and Golden Gate Ave. 2-story frame; owner, D. Gerken; architect, S. Hatfield; contractor, A. H. Plummer; sureties, Blyth & Trott, $3,000; signed, Jan. 9; filed, Jan. 4; cost, $4,95.; payments, $600, frame up; $1,039, rustic on; first coat plaster on; $1,039, plaster done; first coat paint on; $1,041.25, accepted; $1,239.75, 35 days.

Steiner and Germania. To build; owner, Mary E. Empey; contractor, John Foster; sureties, P. Swift and J. Smith, $3,000; signed, Dec. 24; filed, Dec. 30; time, March 10, '90; cost, $1,400; payments, $900, frame up; $900, brown coated; $600, plaster finished; $700, completed; $1,100, 35 days.

Twentieth and Hampshire. 2-story frame; owner, John M. Anderson; architects, John & Balczyniski; contractor, Henry Munster; signed and filed Jan. 2; cost, $4,942; payments; $1,000, frame up; $800; enclosed; —— partitions set; $800, rough mortar on; $1,042, accepted; $1,300, 35 days.

York and Twenty-Second. 2-story frame; owner, W. H. Bonge; architect, F. Koltenstedt; contractors, Tegeler & Muller; signed and filed Dec. 31; cost, $5,100; payments, $990, brick work done, chimneys up; $750, frame up, etc.; $750, brown coated; $750, white coated; $950, completed; $1,500, 35 days.

Quincy and California. Additions; owner, Henry Calliesius; architect, Emile Dejuerre; contractor, J. C. Glasson; signed and filed Dec. 31; cost, $750; payments, 75 per cent, as work progresses; balance, 35 days.

ALAMEDA.

Chestnut and Central Avenue. Owner, G. T. Watterson architect, J. Marquis; contractor, G. Richley; cost, $3,500; signed, Dec. 11; filed, Dec. 12; payments, $400, roof boards on; $700, partitions set; $700, brown mortar on; $800, finished; $900, 35 days.

Percy Tract, block A. 2-story frame; owner, N. L. Freese; contractors, Higgins, Davisson & Co.; signed, Dec. 16; filed, Dec. 20; cost, 2,300; payments, $675, enclosed; $375, brown mortared; $575, completed; $575, 35 days.

Santa Clara Avenue and Prospect street. Double dwelling; time, 105 days from Jan. 1, '90; owner, Michael Kane; architect, Chas. L. Shaner; contractors, J. J. Boyle and H. M. Wood; sureties, J. A. Remmel and Robert Harvey; $2,000; cost, $4,292; signed and filed, Dec. 18; payments, $1,073, rafters on; $1,073; window frames in; $1,073, brown mortar on; $1,073, completed.

Taylor and Page Tract. Dwelling; owner, J. A. Remmel; contractor, R. Gillis; sureties, Angus McRaithem and Wm. Behrens, $2,000; signed, Dec. 17; filed, Dec. 19; cost, $2,000; payments, $750, brown mortared; $750, completed; balance, 35 days.

Railroad Avenue, between Walnut and Willow. Frame; owner, Chas. Laubenheimer; architect, Fred P. Fisher; contractors, D. Straub & Son; signed, Sept. 5; filed, Dec. 26; cost, $3,230; time, 120 days; payments, $900, frame up; $900, brown mortar on; $900, inside finish done; $830, completed.

FRESNO.

In summing up the statement of the amount of building as given by the *Fresno Daily Morning Republican* as an accurate record of the large buildings erected there, we find that $850,500 has been spent upon 32 buildings during the year; $278,000 upon 7 now in the course of construction; and already $137,000 to be expended upon 5 projected buildings, making the total amount for Fresno, 44; costing, $1,265,500. This is for large buildings only, bringing the average cost to more than $25,000 for each building erected.

STOCKTON.

Bids for the school house at Stockton were rejected as being too high. Seven bids were made ranging in amounts from $13,430 to $17,979.

SAN RAFAEL.

Hotel Rafael is having an addition of forty rooms built.

LOS ANGELES.

Building during the past year has reached into the millions, showing that business is still brisk and the building interests extending. The statement of the *Herald* for 1889 gives Los Angeles $4,134,459.

The Supervisors of Sutter Co. have adopted the plans of Curlett & Cuthbertsen for their new Record Hall at Yuba City.

OAKLAND.

The steady growth of building in Oakland, though not figuring up into as many millions as some other cities on the Pacific Coast, is a good sign of prosperity. *The Tribune* and *Enquirer* give the following approximate figures upon the subject:

1887	$1,250,000
1888	1,500,000
1889	1,460,000

These figures are taken from the Plumber's reports, and of necessity are incomplete.

Eddy street, No. 288 Two houses; owners, G. Tomascovic and John Turchan; contractor, R. Gillis; cost, $900; signed, Nov. 30; filed, Dec. 10; payments, $450, shingles on; $450, completed.

Jefferson, near Second. 2-story barn and shed; owners, Oakland Iron Works; contractors, Newman & Paddock; cost, $2,0; payments, $50, rustic on; balance, completed.

East Fourteenth and Park streets. Frame; owner, Oscar Derby; architect, Clinton Day; signed Dec. 14; filed, Dec. 18; cost, $10,469; payment - $1,500, sheathed; $2,200, brown mortar on; $1,400, exterior finished; $1,200, doors and windows hung; $1,551, completed; $2,618, 35 days.

BUILDING NEWS FROM THE GREAT NORTHWEST.

The history of building in Washington for the year 1889 is one that can hardly find a parallel in the annals of the country, and especially so if we take into account the remote situation of her towns and cities from the source of supply for the materials needed.

We quote from the *Seattle Post-Intelligencer*:

IN	NUMBER.	VALUE OR COST.
Seattle.	**3,465.**	**$13,547,979**

"In addition to the above, there has been expended on buildings in the burnt district $1,831,100. These figures are astounding but they are absolutely correct."

Tacoma.	**1,367.**	**$6,000,000**

In this number, there is 3,049 feet of brick business blocks: 3 buildings with 175 feet front, 6 stories high, 2 buildings, 175 feet front, 5 stories high, and 7 buildings, 675 feet front, 4 stories high.

Spokane.		

Five hundred (since the fire) costing $5,200,000, and mostly for business purposes.

Ellensburg.	**35** new brick. (since the fire July 4th.)	

Before the fire this young city had a frontage of 1,468 feet brick to brick buildings, which has now been increased to 3,650 feet.

Port Townsend.	——	**$1,100,000**

This does not include the $250,000 appropriated by Congress for the Custom House now being constructed.

Whatcom.

Three hundred business and residence houses, besides various mills and factories.

Schome.

Three hundred business and residence houses, to which may be added a bank and a school house.

North Yakima.

Two hundred and three residences and business houses, including 9 brick buildings, costing $178,000.

Snohomish.

One hundred residence and business houses, costing $130,000, besides various manufacturing building in and about Snohomish, to the value of over $430,000.

Vancouver.

Has recovered from the fire of last June, and the year 1890 will find the burnt district covered with new brick structures.

PORTLAND, OREGON.

A Brick Manufactory is being erected by the Pacific Metal Works, cost $7,000.

TRADE SUPPLEMENT.

VOLUME 11. JANUARY 18, 1890. NUMBER 1.

BUSINESS MOSAICS.

THE DUNHAM, CARRIGAN & HAYDEN Co., Nos. 17 and 19 Beale street, and 18 to 24 Main street, have an immense stock of Builders Hardware, every conceivable article, almost, in the hardware line is obtainable at their establishment, from the plainest to the highest grade of bronze art-ware.

THE WEST COAST FURNITURE CO., 432 and 434 Fourth street, commence the year with a new assortment of fine Furniture, Wooden-mantles, etc., of the latest designs and styles of finish.

THE VULCAN IRON WORKS, Nos. 135 to 145 Fremont street, are prepared to furnish castings of all manner of constructive iron works. These Works are well known for the finely finished ornamental cast iron work of their manufacture.

W. T. Y. SCHENCK, of Nos. 222 and 224 Market street, secured a patent upon his Paragon Hose Reel and all its improvements. This reel which has been fully recognized as a valuable aid in preventing the spread of fire, has been recently improved so that the reel swings around in such manner as to adjust itself to the direction of the line of hose when run off. In either form, the strain of the bearings is confined to bracketed joinings, thus leaving the water pipe and valve free from such strain.

ONE OF THE OLDEST PIONEERS and veteran cement workers in this city is George Goodman of 307 Montgomery street, the name is synonymous with good materials and good work, and further, he is not afraid to stamp his name on it, either.

The Norton Door Check is in use all over the country. It is placed in the most prominent buildings in this city and shows its usefulness to thousands daily by its easy shutting of the opened door. Frank D. Morrell, the agent for this Door Check, says that he is receiving orders from all points on the Coast for more of them. Wherever the Norton Door Check goes, there it stays, with very little need of repairing, for very frequently they last six or seven years without the least appearance of disorder.

In the case of the Pacific Rolling Mill Co. vs. the Telegraph Hill Railroad to recover $2,788 for material furnished, Judge Lawler decided in favor of the plaintiffs. The case has been for a number of years before the Supreme Court having been originally filed in 1884. The Pacific Rolling Mill Co. is one of the oldest established corporations upon the coast and its specialty is the manufacturing of railroad and merchant iron, rolled beams, cast steel castings, etc. Their main office is 202 Market street, San Francisco.

AN IMPROVED HOSE REEL.

Attention is called to the card of Chapman's Empire Hose Reel, which appears for the first time in this issue. Although a comparatively new invention, the superior mechanical construction of this device, its handsome appearance and improved method of connection with the stand-pipe have secured for it the favorable consideration of some of our most prominent builders, and already a considerable number have been placed in position in this city and elsewhere. With this reel the hose is attached to a hollow axle at a point between the wheels, much in the same way as in the old reels, but one of the principal features of the Empire and a point of superiority which is at once apparent to the mechanical mind is the connection of this axle with the stand-pipe by a revolving water-tight stuffing box which is situated entirely outside the supporting end brackets. This method of construction not only prevents the weight of reel and hose bearing upon the packing of the stuffing box, but secures another most important point, namely—the reel may be attached to the stand-pipe in an upright position, so that when placed in closets or out-of-the-way corners the hose may be pulled off readily to right or left with even more facility than is possible with a swinging reel.

The Empire is manufactured by Mr. R. S. Chapman, a gentleman of practical experience pertaining to fire prevention and extinction; he having been, until recently, for a number of years connected with the San Francisco Fire Underwriters Inspection Bureau in the capacity of insurance surveyor.

Two very superior brands of rubber-lined cotton hose are used by the manufacturer in equipping this reel. The first in point of excellence is the "Treated Safety Mill Hose," manufactured by the Fabric Fire Hose Company, of New York. This hose is balanced woven upon circular looms, which insures uniformity of tension when under pressure and securing great strength with comparatively light weight. In addition, each thread before woven is treated with a preparation of wax and gum which renders the fabric mildew and rot proof. The Treated Safety Mill also has an absolutely smooth water-way, an important item in getting an effective stream where the hydrant pressure is moderate. The other grade of hose is known as the "Empire Mill." This is a strong, serviceable white cotton hose with a pure para rubber lining, and is guaranteed to be the equal in appearance, durability and strength of any mill hose offered on the Coast. Parties interested are cordially invited to call at 18 California street, where one of the reels may be seen in actual working connection with the water main.

FIRE PROTECTION.

The amount of building done in Seattle, Spokane Falls and other parts of the Northwest during the past year only proves the great resources of the Pacific Coast. Recent fires in the East show that brick, concrete and terra cotta, while not fire proof, stand the test of fire better than any other material. Still different clay produces different grades of brick, some inferior and others of the best quality. Recently works have been established at Vallejo which have produced clay unexcelled anywhere on the coast. These yards are owned by the Union Pressed Brick and Terra Cotta Company who are daily shipping to Seattle and other northern points many carloads of pressed brick. Their terra cotta trade with northern cities is also very great. At the present time the company is turning out splendid stained mortars which are being shipped all over the state. Among the prominent builders who are using the company's brick mortars and terra cotta, W. Z. Price has contracted with the company for material for his new villa at Redwood City. In San Jose this companys pressed brick is being used in the new four-story Porter Hotel, Clarence O. Arey, architect.

THE WATER CLOSETS manufactured by Joseph Budde, No. 43 Fremont street, grow in favor as the years pass on, for the simple reason that he uses the best of materials, adding from time to time, such improvements as may be required to meet the demands of the advance in sanitary science.

WASTES OF SOCIETY.

Fresh Air is something which God has set great value upon, but which most men think little of. In this is the heritage of health.

Very few Buildings or dwellings are suitable to live in from want of proper ventilation.

The unfortunate Architect seldom finds an Owner of a Dwelling, who is willing to live as God meant he should, by breathing *Fresh Air*, all for the sake of saving a few dollars, which ought to be expended in providing for ventilation. Men of wealth pay more attention to the architecture and adornment of their homes, than to *proper ventilation*. Their homes indeed look beautiful from without, but within, they are filled, not with dead men, women and children, but with *dead breaths* of their occupants. These homes are literally dens of poison!

There is nothing more poisonous than the effluvia and exhalations that proceed from man.

In a close room, where a family is assembled, they will, in twenty minutes, breathe the air over *once*—in another twenty minutes three times, and by that time every person in the room will have inhaled the effluvia of every other person in the room.

What wonder that our streets are filled with wan-visaged men, women and children!

It is really lamentable to see people, slowly and surely undermining their health, by persisting in building houses, without providing for *ventilation without draughts* (which can be had by the expenditure of a few dollars,) and thus sacrificing the greatest blessing heaven bestows upon man—by persisting in no ventilation or ventilation from Open Windows.

The Homes of the Rich and Poor alike should be ventilated by

Abrahamson's Patent Ventilator without draughts.

The following is one of the thousand testimonials written:—

SUPT. OF COMMON SCHOOLS.

SAN FRANCISCO, NOV. 9th, 1889.

PETER ABRAHAMSON, Esq.—Dear Sir: Allow me to say that I have, not only in my own house, but in six of the Public Schools of this city, had abundant opportunity to witness the excellent effect of your perfect ventilator. I have it in my sleeping room, and in my study room, and having experienced the great benefit resulting from having it, I would not be without it. If people could be made aware of its advantages, I feel sure, that you would not be able to supply the demand. Had I the power, I would have it placed in every window and wall in our schools, believing that such action would conduce more to the preservation of the health of the children and of the teachers than anything else that could be done. We must heartily recommend it to all.

Very respectfully and thankfully yours,

J. W. ANDERSON, 3014 Sixteenth St.,
Supt. Common Schools.

W. W. MONTAGUE & CO., Agts., San Francisco.

Dyckerhoff Portland Cement

Of unrivaled Strength, Fineness and Reliability

BEST AND CHEAPEST

For Foundations, Cellars, Floors, Walks, Artificia Stone, Etc.

These extraordinary qualities permit an unusually large addition of sand, etc., (25 to 50 per cent. more than other well-known Portland Cements) and will produce the strongest most reliable and durable work.

Selling at no higher figure than ordinary good brands of Portland Cement, it is therefore much the cheapest to use.

Dyckerhoff's Portland Cement is always uniform, unalterable in volume, and will not crack.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE ARCHITECTS, meets second Friday of each month at 408 California Street.

TECHNICAL SOCIETY, meets first Friday of each month at 408 California Street.

THE regular monthly meeting of the San Francisco Chapter of the American Institute of Architects was held Friday evening, February 14th. Reports were received from the Trustees, the Executive Committee, and several special Committees. Following is the report of the Committee on awarding the prize offered by the Chapter to the students in the drawing class.

"In November last it was determined by the Chapter to inaugurate a competition for the benefit of the Chapter's classes, and in pursuance thereof a prize of ten dollars (to be expended in books) was offered for the best design—with honorable mentions for second and third designs—in the order of their merit. Messrs. Pissis, Cuthbertson and Sanders were appointed a Committee on awards. The work of the class for the preceding year was also to receive the attention of the Committee. The designs were to be handed in at the first meeting of the Chapter in January, and the award to be announced at next meeting in February. In pursuance of the above, the designs were duely received and your Committee have made the following awards."

First prize to Mr. Sam C. Benson for panel of vine leaves, unsymmetrically arranged and flatly treated, the leaves completely fill the panel, and all carved out of the solid. It is adaptable for various purposes of both internal and external wood work, and is notable for care in execution, and practical character of design, though it is not without faults; among which may be mentioned as the most noticeable, the spot caused by the massing of a single bunch of grapes unsymmetrically in the midst of a flat area of leaves. Had the bunch of grapes been more broken up, with others appearing in the other parts of the field, the effect of the panel would have been greatly improved.

The honor of first mention is awarded to Mr. Joseph Rowell and Mr. Van Vlack for their respective designs. The first, for thistles filling a spandrel, exhibiting considerable originality in design, but unfinished and crude in treatment, the lines being stiff and the foliage wanting in conventional adaptation to material. The second, a symmetrical arrangement of vine, graceful and careful in arrangement, very neatly executed, but wanting in originality of design, are judged by the Committee to be equal in merit.

The flat studies were also examined. First mention being awarded to Mr. Van Vlack, on account of the number and general excellence of his studies. Second mention is awarded to Mr. Rowell for the same reason in a less eminent degree."

Messrs. Carstensen, Pries and O'Connor, a joint committee from numbers 15 and 25 of the International Furniture Worker's Union of North America, and the Wood Carver's Association appeared before the Chapter and presented the following communication:

To the San Francisco Chapter A. I. A.:

GENTLEMEN—We, on behalf of the Furniture Workers and Wood Carvers respectfully present to you the desire of those Trades we represent, to secure as far as possible, to the mechanics of this city, the inside finishing and fitting up of the buildings constructed in this city. We believe it is not neces-

sary to argue upon the desirability of this work being done at home, for as we are raising our families here and form a part of this community, the wages we receive for our labor are thus returned to the general circulation. If the work on which we depend for our support goes to other cities, how are we to exist here? Believing that you are in sympathy with us, more particularly now that many of our men are idle, we would ask you to use your great influence to keep the work of this city, in this city.

Very respectfully, the joint committee,

HENRY CARSTENSEN,
Secretary.

The President in reply to the communication assured the committee that the members of the Chapter were well aware of the desirability of retaining as far as possible all such work for our own mechanics, and would do all in their power to further that end. After transacting the other business of the Society, the meeting adjourned.

THERE is probably no large city in the United States so poorly represented in the matter of public buildings as the city of San Francisco. With a tumble down Post Office, an insecure jail, and an uncompleted City Hall, the citizens truly have little to be proud of, but if they can live on hope for an indefinite number of years to come, they may yet have their dreams of progress and improvement realized. Fair progress is being made with the New City Hall. There is some possibility if not probability of a *lot* being purchased as a site for a new post office, and when the jail shall no longer afford storage room for the unfortunates now overcrowded in its unhealthy cells, the authorities will per force be obliged to take some action towards providing fitting accommodations, so that when a chinaman is arrested for violating the cubic air law, he will not be incarcerated in a cell affording him still less of the blessed air than he obtained in his own stifling bunk in an underground hole in the Chinese quarter.

The recent burning of the Girls High School may not be an unmixed evil. The Board of Education propose to replace the burned building which was a frame structure, with a fire proof building of substantial construction and artistic appearance, and if it teaches the lesson that it is true economy to build substantially it will be worth the present loss incurred.

THE LATE GENERAL VALLEJO.

General Mariano Guadalupe Vallejo, died on the 18th of January in Sonoma at the age of 81 years, surrounded by nearly all the members of his numerous family. General Vallejo was a pioneer among pioneers, and the most distinguished native Californian. He had occupied the most prominent positions, having been Governor of California during the Mexican rule and State Senator during the present government. He was a high minded, honorable gentleman, with fine taste and considerable learning, which, considering the difficulties in obtaining books and the means of education in early days, was really remarkable. His hospitality, liberality and progressive ideas were proverbial. Every visitor at his home was welcome at all times, and with true Spanish hospitality, could stay as long as he desired. Many instances are related when he made presents to people of thousands of acres of land. He gave Andreas Hoepner, a Russian gentleman, a ranch of over 4,000 acres for teaching music to his children. The General inherited from his ancestors great talent for construction; the standard author in mathematics in Spain, in the beginning of this century, was a Vallejo. His father, Don Ignacio Vallejo, one of the original settlers in California who came with Father Junipero Serra, was an engineer and built many of the presidios and irrigating works at the time of the Missions. He at one time projected, and proposed to the authorities of Monterey, the conduction of water to that city from the river Carmel. That project has been carried out by the Pacific Improvement Company, at an expense of half a million dollars. The father of General Vallejo estimated the cost at $10,000, by employing the Mission Indians. General Vallejo was the founder of Sonoma; he built the first structures in that place, consisting of his residence, officers' quarters, barracks, and the church. We give a drawing representing them as they existed before 1848, from a description and sketch by the General's son, Dr. Vallejo. The capital of California was at one time, the city of Vallejo founded by the General; he projected and partly built at his own cost all the State buildings, but the removal of the capital to Sacramento, prevented him from finishing them. With the death of General Vallejo, the State has lost one of her prominent men and the best authority in historical facts in California.

E. J. MOLERA.

BUILDING BY E. J. LENNOX, ARCHITECT, IN *Canadian Architect*.

DAMAGE TO ADJOINING STRUCTURES FROM HEAVY BUILDINGS.

With the increasing size and weight of modern office buildings there come not only serious problems of safe and economical construction, but the still more difficult question of how to prevent damage to adjoining structures, not merely from undermining of foundations which can be avoided by suitable underpining, but from the actual compression of the soil.

If anyone will take the trouble to examine the old and comparatively light buildings alongside of which some high and heavy structure has recently been erected, the chances are that he will find the old buildings more or less damaged by their new neighbor, and cracked walls and sills, and especially cracked lintels over the nearest windows, will show that the old wall next the more recent structure has been carried bodily downward. As before intimated the settlement in most cases is not caused by any defect in or injury to the foundation of the old building, but by the fact that the heavier structure has compressed the soil and taken the lighter one down with it.

As the evil is progressive, increasing as the new building goes up, and for some time after it is finished, it cannot be provided against once for all, but the remedy must be progressive also, and the only way to prevent the injury is to keep the old wall wedged or screwed up while the new one goes down. The only instance we know of where this has been done is in the case of a large building now being erected in Chicago, where the soil is so compressible that such a building is expected to settle three or four inches during construction, and where one fine tall building has had one corner carried down four or five inches by a heavier building alongside, with the result of very badly cracking the older structure from top to bottom through the nearest line of windows. To avoid such a disaster the wall of the old building some seven stories high, next which the new building just mentioned is being put up, is temporarily supported on screws, and is by them kept slightly above its normal position so as to allow for settlement between times. These screws will support the old wall for some six months after the new building is finished, and until all settlement is over. With a less compressible soil, or a lighter building, perhaps iron counter-wedges between stout bearing stones would give sufficient lift, and could be left in when the new building was completed.—*The Engineering and Building Record.*

THE STRUCTURE OF SANDSTONE.

Read before the Liverpool Architectural Society, by Mr. T. Mellard Reade.

Sandstones, or, in masons' language, "freestones," from the freedom with which most of them are worked when freshly taken from the quarry, are plastic or sedimentary rocks. That is, they are composed of separate particles which have once existed as sand, like that we see on our own shores, or in the sand dunes of Hoylake or Crosby. Sandstones are usually more or less laminated, and are stronger to transverse stress at right-angles to their natural bedding than in any other direction, a fact recognized in every architect's specification, which states "all stones must be laid on their natural bed," a direction that unfortunately sometimes begins and ends in the specification. The cause of the superior strength is not, however, generally understood.

I have devoted some considerable time to an investigation of the internal structure of sandstones, which I have communicated from time to time to various scientific societies and publications, and will now briefly explain in a manner I judge will be most likely to interest architects and engineers. The particles or grains of which the rock is built up are of various forms and sizes, from a thoroughly rounded grain, almost like shot, to a broken and jagged structure, and to others possessing crystalline faces. These grains, most of them possessing a longer axis, have been rolled backward and forward by the tides or river-currents. The larger grains naturally lie on their sides when freshly deposited, with their axes in the plane of bedding; the smaller and more rounded particles naturally tend to occupy the interstices between the others, and in this way rude divisional planes, or laminations are formed. Each layer forms a sort of course like coursed-rubble in a wall, and by the necessities of deposition a certain rude geometric arrangement results, by which the particles of the future rock overlap each other, and thereby gain what is known to architects as bond.

But, so far, this is only like "dry walling," the mass wants cementing together to make it solid. The cementing process happens in this way in our rocks, which are almost purely silicious: Water containing a minute quantity of carbonic acid in solution, which most rain-water does, especially when it comes into contact with decaying vegetation, has the power of dissolving silica to a slight extent. This is proved in various ways, and is shown in the fact that all river water contains more or less silica in solution.

The circulation of water through the sand deposit of which our rocks are made dissolves part of the grains, and the silica taken up is redeposited on others. I cannot explain the chemical reaction that produces this deposition, but that it takes place in the rock during some period of its history is certain. I exhibit a quartzite pebble taken from the triassic sandstone at Stanlow Point, which, as can be easily seen, was at one time worn perfectly smooth by attrition and long-continued wear, for the quartzite is very hard. Upon this worn surface you will see spangles and facets which reflect the light, and on closer inspection it will be evident that they are crystals of quartz that have been deposited upon the surface of the worn pebble after it became finally inclosed in the rock.

A microscopic examination of the granules of the rock itself will show that many of them have had crystalline quartz deposited upon their surfaces, and in some cases rounded grains have in this way become almost perfect crystals.

An examination of the best sandstones for building purposes shows that they possess more of these crystalline particles than the inferior ones, and a good silicious sandstone shows its good quality by a fresh fracture sparkling in the sun. In addition to these crystalline deposits of silica I believe it exists also as a cement which binds the particles together when in contact.

It certainly is, however, with this secondary silica that the original sand has become a building stone, and the particles have become interlaced and bound together. Thus, in building parlance, the grains are the rubble of the wall, the currents the quarrymen, masons and laborers, and the silicious infiltration the mortar.

It is a remarkable fact that most of the pebbles included in the red rocks are quartzites, or indurated silicious sandstones; and, as showing that their solidity and hardness are due only to a further continuation of the deposit of silica in the interstices, it has been proved that the purple quartzites are purple only by reason of the original coloration of the grains which have been inclosed between the original grains and the secondary silica.

Dyckerhoff Portland Cement

Of unrivaled Strength, Fineness and Reliability

BEST AND CHEAPEST

For Foundations, Cellars, Floors, Walks, Artificia Stone, Etc.

These extraordinary qualities permit an unusually large addition of sand, etc., (25 to 50 per cent. more than other well-known Portland Cements) and will produce the strongest most reliable and durable work.

Selling at no higher figure than ordinary good brands of Portland Cement, it is therefore much the cheapest to use.

Dyckerhoff's Portland Cement is always uniform, unalterable in volume, and will not crack.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE ARCHITECTS, meets second Friday of each month at 408 California Street.

TECHNICAL SOCIETY, meets first Friday of each month at 408 California Street.

THE regular monthly meeting of the San Francisco Chapter of the American Institute of Architects was held Friday evening, February 14th. Reports were received from the Trustees, the Executive Committee, and several special Committees. Following is the report of the Committee on awarding the prize offered by the Chapter to the students in the drawing class.

"In November last it was determined by the Chapter to inaugurate a competition for the benefit of the Chapter's classes, and in pursuance thereof a prize of ten dollars (to be expended in books) was offered for the best design—with honorable mentions for second and third designs—in the order of their merit. Messrs. Pissis, Cuthbertson and Sanders were appointed a Committee on awards. The work of the class for the preceding year was also to receive the attention of the Committee. The designs were to be handed in at the first meeting of the Chapter in January, and the award to be announced at next meeting in February. In pursuance of the above, the designs were duely received and your Committee have made the following awards."

First prize to Mr. Sam C. Benson for panel of vine leaves, unsymmetrically arranged and flatly treated, the leaves completely fill the panel, and all carved out of the solid. It is adaptable for various purposes of both internal and external wood work, and is notable for care in execution, and practical character of design, though it is not without faults; among which may be mentioned as the most noticeable, the spot caused by the massing of a single bunch of grapes unsymmetrically in the midst of a flat area of leaves. Had the bunch of grapes been more broken up, with others appearing in the other parts of the field, the effect of the panel would have been greatly improved.

The honor of first mention is awarded to Mr. Joseph Rowell and Mr. Van Vlack for their respective designs. The first, for thistles filling a spandrel, exhibiting considerable originality in design, but unfinished and crude in treatment, the lines being stiff and the foliage wanting in conventional adaptation to material. The second, a symmetrical arrangement of vine, graceful and careful in arrangement, very neatly executed, but wanting in originality of design, are judged by the Committee to be equal in merit.

The flat studies were also examined. First mention being awarded to Mr. Van Vlack, on account of the number and general excellence of his studies. Second mention is awarded to Mr. Rowell for the same reason in a less eminent degree."

Messrs. Carstensen, Pries and O'Connor, a joint committee from numbers 15 and 25 of the International Furniture Worker's Union of North America, and the Wood Carver's Association appeared before the Chapter and presented the following communication:

To the San Francisco Chapter A. I. A.:

GENTLEMEN—We, on behalf of the Furniture Workers and Wood Carvers respectfully present to you the desire of those Trades we represent, to secure as far as possible, to the mechanics of this city, the inside finishing and fitting up of the buildings constructed in this city. We believe it is not neces-

sary to argue upon the desirability of this work being done at home, for as we are raising our families here and form a part of this community, the wages we receive for our labor are thus returned to the general circulation. If the work on which we depend for our support goes to other cities, how are we to exist here? Believing that you are in sympathy with us, more particularly now that many of our men are idle, we would ask you to use your great influence to keep the work of this city, in this city.

Very respectfully, the joint committee,

HENRY CARSTENSEN,
Secretary.

The President in reply to the communication assured the committee that the members of the Chapter were well aware of the desirability of retaining as far as possible all such work for our own mechanics, and would do all in their power to further that end. After transacting the other business of the Society, the meeting adjourned.

THERE is probably no large city in the United States so poorly represented in the matter of public buildings as the city of San Francisco. With a tumble down Post Office, an insecure jail, and an uncompleted City Hall, the citizens truly have little to be proud of, but if they can live on hope for an indefinite number of years to come, they may yet have their dreams of progress and improvement realized. Fair progress is being made with the New City Hall. There is some possibility if not probability of a *lot* being purchased as a site for a new post office, and when the jail shall no longer afford storage room for the unfortunates now overcrowded in its unhealthy cells, the authorities will per force be obliged to take some action towards providing fitting accommodations, so that when a chinaman is arrested for violating the cubic air law, he will not be incarcerated in a cell affording him still less of the blessed air than he obtained in his own stifling bunk in an underground hole in the Chinese quarter.

The recent burning of the Girls High School may not be an unmixed evil. The Board of Education propose to replace the burned building which was a frame structure, with a fire proof building of substantial construction and artistic appearance, and if it teaches the lesson that it is true economy to build substantially it will be worth the present loss incurred.

THE LATE GENERAL VALLEJO.

General Mariano Guadalupe Vallejo, died on the 18th of January in Sonoma at the age of 81 years, surrounded by nearly all the members of his numerous family. General Vallejo was a pioneer among pioneers, and the most distinguished native Californian. He had occupied the most prominent positions, having been Governor of California during the Mexican rule and State Senator during the present government. He was a high minded, honorable gentleman, with fine taste and considerable learning, which, considering the difficulties in obtaining books and the means of education in early days, was really remarkable. His hospitality, liberality and progressive ideas were proverbial. Every visitor at his home was welcome at all times, and with true Spanish hospitality, could stay as long as he desired. Many instances are related when he made presents to people of thousands of acres of land. He gave Andreas Hoepner, a Russian gentleman, a ranch of over 4,000 acres for teaching music to his children. The General inherited from his ancestors great talent for construction; the standard author in mathematics in Spain, in the beginning of this century, was a Vallejo. His father, Don Ignacio Vallejo, one of the original settlers in California who came with Father Junipero Serra, was an engineer and built many of the presidios and irrigating works at the time of the Missions. He at one time projected, and proposed to the authorities of Monterey, the conduction of water to that city from the river Carmel. That project has been carried out by the Pacific Improvement Company, at an expense of half a million dollars. The father of General Vallejo estimated the cost at $10,000, by employing the Mission Indians. General Vallejo was the founder of Sonoma; he built the first structures in that place, consisting of his residence, officers' quarters, barracks, and the church. We give a drawing representing them as they existed before 1848, from a description and sketch by the General's son, Dr. Vallejo. The capital of California was at one time, the city of Vallejo founded by the General; he projected and partly built at his own cost all the State buildings, but the removal of the capital to Sacramento, prevented him from finishing them. With the death of General Vallejo, the State has lost one of her prominent men and the best authority in historical facts in California.

E. J. MOLERA.

BUILDING BY E. J. LENNOX, ARCHITECT, IN *Canadian Architect*.

DAMAGE TO ADJOINING STRUCTURES FROM HEAVY BUILDINGS.

With the increasing size and weight of modern office buildings there come not only serious problems of safe and economical construction, but the still more difficult question of how to prevent damage to adjoining structures, not merely from undermining of foundations which can be avoided by suitable underpining, but from the actual compression of the soil.

If anyone will take the trouble to examine the old and comparatively light buildings alongside of which some high and heavy structure has recently been erected, the chances are that he will find the old buildings more or less damaged by their new neighbor, and cracked walls and sills, and especially cracked lintels over the nearest windows, will show that the old wall next the more recent structure has been carried bodily downward. As before intimated the settlement in most cases is not caused by any defect in or injury to the foundation of the old building, but by the fact that the heavier structure has compressed the soil and taken the lighter one down with it.

As the evil is progressive, increasing as the new building goes up, and for some time after it is finished, it cannot be provided against once for all, but the remedy must be progressive also, and the only way to prevent the injury is to keep the old wall wedged or screwed up while the new one goes down. The only instance we know of where this has been done is in the case of a large building now being erected in Chicago, where the soil is so compressible that such a building is expected to settle three or four inches during construction, and where one fine tall building has had one corner carried down four or five inches by a heavier building alongside, with the result of very badly cracking the older structure from top to bottom through the nearest line of windows. To avoid such a disaster the wall of the old building some seven stories high, next which the new building just mentioned is being put up, is temporarily supported on screws, and is by them kept slightly above its normal position so as to allow for settlement between times. These screws will support the old wall for some six months after the new building is finished, and until all settlement is over. With a less compressible soil, or a lighter building, perhaps iron counter-wedges between stout bearing stones would give sufficient lift, and could be left in when the new building was completed.—*The Engineering and Building Record*.

THE STRUCTURE OF SANDSTONE.

Read before the Liverpool Architectural Society, by Mr. T. Mellard Reade.

Sandstones, or, in masons' language, "freestones," from the freedom with which most of them are worked when freshly taken from the quarry, are plastic or sedimentary rocks. That is, they are composed of separate particles which have once existed as sand, like that we see on our own shores, or in the sand dunes of Hoylake or Crosby. Sandstones are usually more or less laminated, and are stronger to transverse stress at right-angles to their natural bedding than in any other direction, a fact recognized in every architect's specification, which states "all stones must be laid on their natural bed," a direction that unfortunately sometimes begins and ends in the specification. The cause of the superior strength is not, however, generally understood.

I have devoted some considerable time to an investigation of the internal structure of sandstones, which I have communicated from time to time to various scientific societies and publications, and will now briefly explain in a manner I judge will be most likely to interest architects and engineers. The particles or grains of which the rock is built up are of various forms and sizes, from a thoroughly rounded grain, almost like shot, to a broken and jagged structure, and to others possessing crystalline faces. These grains, most of them possessing a longer axis, have been rolled backward and forward by the tides or river-currents. The larger grains naturally lie on their sides when freshly deposited, with their axes in the plane of bedding; the smaller and more rounded particles naturally tend to occupy the interstices between the others, and in this way rude divisional planes, or laminations are formed. Each layer forms a sort of course like coursed-rubble in a wall, and by the necessities of deposition a certain rude geometric arrangement results, by which the particles of the future rock overlap each other, and thereby gain what is known to architects as bond.

But, so far, this is only like "dry walling," the mass wants cementing together to make it solid. The cementing process happens in this way in our rocks, which are almost purely silicious: Water containing a minute quantity of carbonic acid in solution, which most rain-water does, especially when it comes into contact with decaying vegetation, has the power of dissolving silica to a slight extent. This is proved in various ways, and is shown in the fact that all river water contains more or less silica in solution.

The circulation of water through the sand deposit of which our rocks are made dissolves part of the grains, and the silica taken up is redeposited on others. I cannot explain the chemical reaction that produces this deposition, but that it takes place in the rock during some period of its history is certain. I exhibit a quartzite pebble taken from the triassic sandstone at Stanlow Point, which, as can be easily seen, was at one time worn perfectly smooth by attrition and long-continued wear, for the quartzite is very hard. Upon this worn surface you will see spangles and facets which reflect the light, and on closer inspection it will be evident that they are crystals of quartz that have been deposited upon the surface of the worn pebble after it became finally inclosed in the rock.

A microscopic examination of the granules of the rock itself will show that many of them have had crystalline quartz deposited upon their surfaces, and in some cases rounded grains have in this way become almost perfect crystals.

An examination of the best sandstones for building purposes shows that they possess more of these crystalline particles than the inferior ones, and a good silicious sandstone shows its good quality by a fresh fracture sparkling in the sun. In addition to these crystalline deposits of silica I believe it exists also as a cement which binds the particles together when in contact.

It certainly is, however, with this secondary silica that the original sand has become a building stone, and the particles have become interlaced and bound together. Thus, in building parlance, the grains are the rubble of the wall, the currents the quarrymen, masons and laborers, and the silicious infiltration the mortar.

It is a remarkable fact that most of the pebbles included in the red rocks are quartzites, or indurated silicious sandstones; and, as showing that their solidity and hardness are due only to a further continuation of the deposit of silica in the interstices, it has been proved that the purple quartzites are purple only by reason of the original coloration of the grains which have been inclosed between the original grains and the secondary silica.

Yellow sandstone is colored also by iron, and I have frequently seen the red sandstone shading off to yellow without any division whatever. The various shades and tints of sandstone are necessarily due to the coloration of the individual grains.

Most of you will, no doubt, have observed the sort of marbling or grain upon the stone of our old buildings, such as the town hall, which I believe was obtained from quarries occupying the site of the St. James cemetery. This is due to what is called current bedding; that is to say, the grains have been arranged along oblique lines and curves instead of in parallel laminæ. This stone, which is geologically equivalent to the Storeton stone, and of the same nature, has stood very well. Some of the Storeton stone, if free from clay galls, although very soft when quarried, becomes hardened by exposure, and will stand the weather much better than a harder and more pretentious material.

The rocky substratum of a district can be well seen in its ancient buildings, for in old times carriage was so important an item that the old builders could not go far for their stone; hence we see that the old churches of part of Lancashire and most of Cheshire, and a large portion of Shropshire, are of red sandstone. Some of it has stood very well, while some has decayed into shapeless masses. There is a tendency to exfoliate parallel to the exposed or worked surface, in all stones, irrespective of the way of the bed, but more so where the stone is set upon edge, or at right angles, to its quarry bed. It is interesting and peculiar to see in some of the old buildings erected with pebbly sandstone how the white quartz pebbles stand out from the surface like warts. This is due to the greater indestructibility of the quartz pebbles, and the weathering away, or denudation, of the sandstone face.

Before leaving the subject of local sandstone it will be necessary to refer to one quality they have which is of excellent utility as regards the storage of water, but which is a decided disadvantage in building stone—that is, their porosity. I have proved by actual experiment that a cubic foot of Runcorn stone will take up three quarts of water by capilarity, and that it is possible to make a syphon of solid sandstone which will empty a vessel of water into another vessel with capilarity alone. This shows the absolute necessity of damp-proof courses, not only in the main walls of buildings of stone, but even in fence walls, for the continual sucking up of moisure from the earth, and its evaporation at the surface of the stone, make it rapidly decay. I think I could show you this fact in almost any stone building in Liverpool or elsewhere the stone is in direct connection with the earth. It also shows the necessity of taking care that no stones go through the wall to the interior surface, and of precautions, for backing up stone walls with less porous materials, or the introduction of a cavity. If you could suppose such a sandstone wall 40 feet long, 20 feet high and 1 foot 6 inches thick fully saturated, it would hold almost a ton of water. Of course, it never would be fully saturated, because of the evaporation from the surfaces, but with a southwest aspect, and very wet weather, it might become half saturated. But what does evaporation mean? It means the loss of so much heat and the burning of so much coal to supply its place. From this it will be seen that a pure sandstone wall is a thing to be avoided.

The subject is so wide a one that I have felt compelled to restrict my remarks to local sandstones, but the general principles of structure apply to all sandstones alike.

It is difficult by written description to tell you how to select a good stone, but one essential is that there shall be a good deposition of secondary quartz, as shown by the crystalline sparkling on the freshly fractured surface.

It must also be free from very decided laminations, for these constitute planes of weakness and are often indications of the deposition of varying materials, or the same material in various grades of fineness. It must also not be full of argillaceous and iron-oxide infillings. It should possess a homogeneous texture. The best way to study building stones is to study them in old buildings, for nature has then dissected their weaknesses.—*Stone.*

The *Boston Transcript* applauds the idea of having an architect's name conspicuosly placed on the building he has designed. It would save so much time to persons who purpose to build in making up a list of architects to be avoided.—Ex.

El Refugio, Mexico, Jan. 5th, 1890.

To the Editor of the
California Architect and Building News—

Dear Sir:—As I promised you before leaving San Francisco for a year's stay in Mexico, I have made notes of such of my observations as I think will be most likely to interest the subscribers to your journal, and take this opportunity to send them by a courier who leaves to-day. I will not bore you with a description of the journey, more than to say it occupied nearly two weeks, the last hundred and forty miles being done on mule's backs over the roughest kind of mountains, and along trails where a mis-step would have been fatal.

I enclose several photographs of the scenery in this vicinity, and of the towns and villages on the route. The cathedral appears to be the principal architectural feature of the towns. It is said to be a fact that when the cathedral at Chihuahua was built, about one hundred and fifty years ago, that no staging or scaffolding of any description was used, but as the walls were

CATHEDRAL.

built up, the interior of the church was filled with earth, which was also banked up on the outside of the walls to a corresponding height, and only removed upon the completion of the building.

I noticed in passing through Chihuahua that the poles for scaffolding purposes were made of small sticks bound together with rawhide, so spliced that from short pieces a scantling was formed answering for a three-story building. The window openings in a Government building under construction, instead of being temporarily closed with boards or cloth as is customary with us, were built up with adobes.

The towns and villages we passed through on our way to this place looked (at first sight) like huge brickyards with the kilns unburnt (all the buildings being of adobe.)

The general plan of the dwelling houses is a square with only one opening on one side, with a central court yard from which

TOWN OF JESUS MARIA, CHIHUAHUA, MEXICO.

doors open into the rooms. No windows are considered necessary. This may have been originally designed as a protection against the Indians, (at one time very troublesome) but is now doubtless continued from habit. The sameness in the appearance of these dwellings is very monotonous. The roofs are almost flat and are covered with mud, though this method of roofing seems strange at first sight, yet you must consider that mud is plentiful and wood and timber very scarce in many parts of Mexico, and the people very lazy; in fact most of the work is done by peons, or what were peons before the law set them free. But as most of them don't know they have been liberated, they go on working for their employers as before, earning two or three bits a day, and always in debt to their employers. The Indians who carry our mail are paid only three bits a day, and their position is no sinecure either, as they have to traverse on foot a distance of one hundred and forty miles in two days—yet they are a contented lot notwithstanding, and if they earned more would only gamble it away, and be no better off. All their desires are fulfilled if they get plenty of beans to eat, a few rags to wear, a blanket to sleep in, and firearms for their personal use.

I received the sample copy of the journal you sent me and congratulate you on the improvement you have made in its appearance since the new management took control.

We had a new cable for the mine sent us last month and it came in on a mule train as do all our supplies. Much difficulty is experienced with loads like this, however, and the *modus operandi* is quite curious. To begin with as much of the rope is coiled on the back of the first mule as he can carry, a loop of ten feet or so is then left slack and the cable then coiled to form the load of the mule following, and this proceeding is followed until the entire cable is loaded, when the train starts off on a journey of several day's duration. As a man is required for each mule the expense of transportation by this method is necessarily considerable. The cost in this instance amounted to five hundred dollars.

With best wishes for the continued success of your journal,

I remain, Yours very truly,

ALEX. H. EVERETT.

ECONOMY IN THE USE OF STEEL IN BUILDING CONSTRUCTION.*

By W. L. B. Jenney, Architect.

Fireproof work has become the rule rather than the exception in all important buildings. Our cities are growing rapidly, land in business centers becoming more and more valuable, and as a necessary consequence the buildings are built higher and higher.

Chicago has a very wise law, namely, that all buildings over 100 feet high shall be fireproof.

No hotel, theater, or apartment house can be popular unless fireproof. Any business man would think himself inexcusably careless if he left a thousand-dollar bond over night in other than a fireproof vault, and yet we trust our greatest treasures, our wives and children, in very combustible buildings, and ourselves are often away on business for weeks at a time. Too many sad examples are recorded of the folly of such risks. It is pleasing to see that at length the importance of fireproof dwellings has come well to the front and is meeting with universal endorsement.

*A few paragraphs on this subject having appeared anonymously in the Chicago *Tribune*, and, as such an article, to be of value, must have the stamp of authority, Mr. Jenney has, at our request, reviewed and enlarged it.—Editors Inland Architect.

This extended use of iron in building, at a time when other demands are fully equal to the average, has advanced the price of raw material and encouraged the "combination" to advance the price of beams three-tenths cents per pound.

Evidently, it becomes the duty of the architect to study how he may economize and produce the desired results at least expense. An opportunity is offered in the use of steel instead of iron.

The I-beam is the important factor in fireproof construction. When we consider that the ultimate tensile strength of iron beams is but 48,000 to 52,000 pounds per square inch of sectional area, while that of steel is from 63,000 to 70,000, it is easy to see that if the section of the beam is such as to give the greatest practical value to the metal used, there is a saving in the weight of metal by the use of steel instead of iron, amounting to one-quarter or even one-third.

As the price per pound is the same for steel and for iron beams the saving in money is enormous. For example, I have under construction a building which will require $250,000 worth of steel beams. Should iron beams be used, it would add at least $50,000 to the cost, with no advantage, but rather with the disadvantage of the additional load on the columns and foundations. To effect this saving, the architect must base his calculations on a tensile strength of say, 60,000 pounds per square inch, and must be sure he obtains it in the steel.

To be certain of getting this result, the specifications must not only demand it, but also that test bars be taken from each "blow" or charge of the converter and tested in the presence of an agent appointed by the architect; and that no beams will be received unless up to the required strength. That it is not difficult to obtain this strength is seen from the "test sheets," showing the testing of 276 "blows" of the converters at the mills, made by an engineer from my office. Of the 276 tests only thirty are below 64,000 pounds and the lowest is 61,500.

As the quality of the steel improves these figures enlarge. I think that even now we might insist upon a minimum tensile strength of 64,000 pounds per square inch, without any increase in the cost to the consumer.

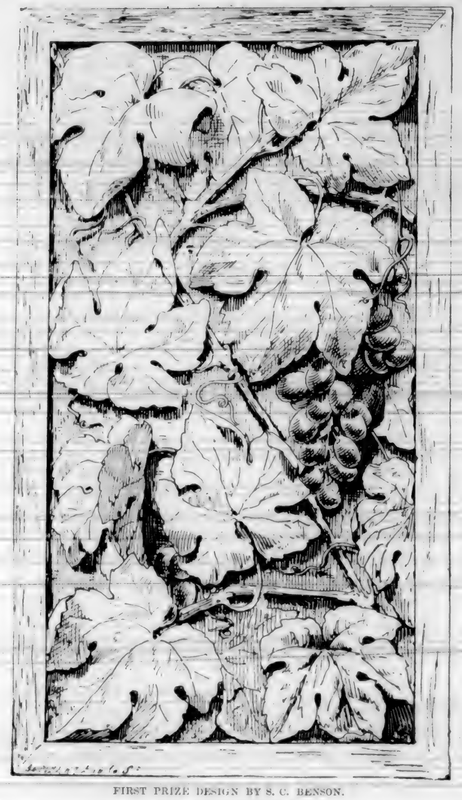
There are other tests required, for example, to insure that the beams shall not take a permanent set if moderately overloaded; that the beams can be punched without splintering and bent without breaking. After all the physical tests are satisfactory, the beams must be inspected for surface defects, and none but perfectly rolled, straight beams must be received.

It is true that such careful, thorough inspection is expensive to the architect, but the saving is so great that there is no other detail in an architect's practice by which he can save so much money for his client, and it should never be neglected.

There has been so much discussion of late as to the relative value of rolled steel columns and cast-iron columns. In bridges the cast-iron has entirely passed out of use. In a building to be filled with heavy running machinery, the architect should insist upon rolled steel columns, but for an office building, a store, or a warehouse, when the load is steady, it becomes a question of cost.

For cast-iron columns the architect must insist that from each heat of the cupola two test bars be cast, each of which is tested by placing it on supports and loading in the center with a weight proportionate to the size of the bar and the distance between points of support. Should the bars break, the metal is inferior and not acceptable. Each column should be drilled in two directions for measuring the thickness of metal, and then careful examination made for surface defects. Cast-iron has the disadvantage of being liable to internal defects that the most rigid inspection might fail to detect, and consequently the columns are made heavier than otherwise would be necessary. Even with the disadvantage of greater weight, the "proposals" for furnishing cast-iron columns are at present usually less than for rolled steel. To avoid the uncertainty which forces the architect to specify cast-iron columns one-quarter heavier than he otherwise would do, some of the leading foundries are now considering the policy of adding to their plant a large testing machine, in which each column may be tested up to double the load which it is calculated to bear. Any foundry that has such a machine can command the best work at the highest price, for it will save to the owner twenty-five per cent. at least in weight of metal now considered necessary for safety.

These are but a small portion of the engineering features that the demand for tall, expensive, fireproof buildings has introduced into a Chicago architect's office.—*Inland Architect.*



FIRST PRIZE DESIGN BY S. C. BENSON.

CO-OPERATION IN ENGLAND.

The question of *how* to keep the man, or men, who act in a subordinate capacity seldom enters into the calculations of the head of any enterprise, whether mercantile, professional, or mechanical. There are however, some exceptions to this, as to every statement that may be made. We sometimes hear of a business house or financial institution giving its employees a stated share of the profits should there be any. We now hear from England that the building firm of Peto Bros. have been awarded a large contract on a public building, and will take this opportunity to try the effect of profit-sharing with their men. They make the announcement through a circular, that it will only apply to this contract, but if it works well, will extend to future cases.

The agreement will be to divide one quarter of the net profits among the men when the building is done and the accounts settled as a bonus above their wages in proportion to the wages they have earned. The conditions under which each man is entitled to his share are that he shall have worked long enough on the contract to have earned five pounds, at the regular rate of wages; that he shall not have neglected his duty, or misconducted himself or wasted his time, or in other ways have acted so as to diminish the profits of the contract, or injure the reputation of the firm for good and honest work; and, that he shall not have engaged in any strike for shorter hours, or for wages above the schedule of wages which prevailed at the time the contract was made, and upon which the contract was based. That the workmen may assure themselves of the fairness with which the division is carried out they are invited by the circular to send a representative to watch the making up of the accounts by the auditor of the firm, and to sign the balance sheet. In order to identify the claimants every man must obtain a printed ticket from the time-keeper, on beginning his work, countersigned by the foreman, and noting the day and hour when his employment commenced, with his name, number and wages. This is to be again signed and countersigned when he leaves, and must be produced to secure a share in the dividend. What will be the effect of this innovation among the laboring element of England is, as yet, problematical. The trade-unions of that country may not take kindly to permitting some of their fellows doing as they please and thus bring about a contest that may try the executive ability of Messrs. Peto to cope with.

W. C. Prime, L. L. D. has made some interesting figures as to how much of the earth's surface would be required, in one section to properly bury all the men, women and children who have died since the creation. He says: The population of the earth is about 1,500,000,000. Suppose the human race to have existed for 6000 years and to have been always as great as now. In 6000 years you have sixty centuries and 180 generations, each a generation of 1,500,000,000. Now lay out a cemetery for one generation giving each man, woman and child five feet by two, or ten square feet. That gives a graveyard of 15,000,000,000 square feet and as a square mile contains 25,000,000,000 square feet, you want a graveyard not less than fifty five miles long by ten wide for one generation. Multiply this by your 180 generations, and get a strip of land 1800 miles by 55 wide, or a graveyard for the deaths of 6000 years. On that basis of figuring Texas contains ground enough for the burials of the 6000 years that are past and the 6000 years to come. But some one says the race of man has been on earth 100,000 years. Suppose it to be true and suppose the population to have been always as now. We have provided for 6000 years, and now want figures for seventeen times as many years. That is, you want 1,700,000 square miles or a spot 1700 miles long and 1000 miles wide. It would be only a *part* of the United States, and it is safe to say, that had the human race been in existence 100,000 years, a separate grave could be provided for each individual in the land east of the Mississippi River.

We illustrate this month a country residence from the designs of F. Lobdell architect, of Los Gatos.

An example of Japanese architecture promised in our last number to accompany the paper of Mr. Shimoda.

And on the double plate several interesting drawings descriptive of the new Auditorium Building designed and erected by architects, Alder and Sullivan.

Two fire places and mantels are being designed by Curlett & Cuthbertson for the rooms of the Sutter Club now being finished in the New California State Bank Building at Sacramento. The lower portions are of red stone and the upper of hard woods.

Our double plate shows some interesting drawings of the celebrated Anditorium Building lately completed in Chicago. the architects, Messrs. Adler and Sullivan have designed and constructed a building, that is not only a credit to themselves, but to the profession in America as well. From the foundation to the finishing, the various requirements of strength, durability, utility and fitness have been carefully studied and provided for. The following facts are compiled from the Daily Inter Ocean, which contained a long and interesting description of the building. The building has a frontage of 162 feet on Wabash Avenue, 362 feet on Congress street and 187.6 feet on Michigan Avenue, covering on area of 62,000 square feet.

The foundations consist of a four foot base of concrete, resting on a floor or platform of pine lumber.

Seventeen million bricks enter into the walls of the building, which are faced with Maine granite and buff Bedford stone.

There are eleven dynamos, eleven boilers, twenty-one pumping engines, and thirteen elevators; ten thousand electric lights, two hundred and thirty miles of electric wires and cables; over twenty-five miles of gas and water pipe; over fifty thousand

PLAN OF TEMPLE

square feet of Italian marble mosaic floors, containing over fifty million separate pieces of marble.

The cost of the building with its equipments, etc., reached nearly three million dollars.

The office portion of the building is located in the ten stories fronting on Wabash Avenue, and is reached by a broad flight of marble and iron steps, and three elevators. There are one hundred and twenty-six offices finished in antique oak.

The hotel occupies the ten stories on Michigan Avenue and Congress street fronts, and has four hundred rooms.

The entrance to the theatre is from Congress street. Its high arched ceiling studded with electric lights, and supported by massive pillars of porphory, its inlaid mosaic floor, its graceful box offices of bronze, its marble walls of scintilating colors contrasting with the polish of the mahogany trimmings, make a scene to vie with Aladdin's palace.

The seating capacity of the various portions of the theatre are as follows: Balcony, 1432; Family circle, 437; Gallery, 526; Parquet, 1442; 40 Boxes, 200. Total, 4037.

PROTECTING ELECTRIC WIRES.

The rules of the Boston Manufacturers Mutual Fire Insurance Company for guarding insured property against the hazard of stray currents of electricity generated outside of mill yards are as follows:

First—No foreign wires of any kind shall be attached to buildings insured by this company for the purpose of carrying electric currents across the yard to any point.

Second—All electric wires which may be required by the insured shall enter the premises at one point near the headquarters of the nightwatchman, where they can be kept under supervision; each of said wires shall be guarded by a protector against strong currents, operating by opening the circuit, and by a lightning arrester.

Third—Such protectors against strong currents shall be located in a dry, accessible place inside the building, and as near the point of entrance of wires as possible, and shall be without ground connection; such protectors shall be mounted on non-combustible and insulated supports, which shall be provided with a receptacle for the burning or melted parts of such apparatus.

Fourth—The lightning arresters on all wires must be placed between the protector against strong currents and the electrical portion of the apparatus within the building to which such wires are connected. No ground wires for such lightning arrester shall be attached to gas pipes within the premises of the insured.

Fifth—All electric wires which may enter the premises of the insured must be insulated between the line wire on the insulator attached to the buildings outside and the protecting device within with the best quality of waterproof insulation. Moreover, such wires must enter at a distance of not less than three (3) inches from any other wire or any conducting material.

Sixth—If any wires carrying high tension or strong currents are to be carried over or under other wires on the property of the insured they shall be attached to poles so near to each other, with one wire so far above the other that if a break should occur the pendant wire between these poles may not be long enough to come in contact with the wire below, or, if not carried on poles, these wires shall be so placed or protected with guard wires as to render a contact between different wires impossible.

Seventh—If the high and low tension systems are in use in the same yard, even when developed within the works, the wires must be kept separate, and so wide apart that no contact or cross arc can be made.—*Fire and Water.*

ANNUAL MEETING OF THE CALIFORNIA ELECTRICAL SOCIETY.

The annual meeting of the California Electrical Society was held at their rooms the 3d instant. By the reports of the officers for last year, the Society is in a good financial condition. The following named officers were elected for the ensuing year: N. S. Keith, President; Orion Brooks, Vice-President; W. W. Wight, Secretary; W. Hanscom Jr., Treasurer, and Edward Roe, H. T. Bestor and A. W. Smith as the three other members of the executive committee. On account of their aid in the science of electricity the following named gentlemen were proposed and unanimously elected honorary members of the Society: A. G. Davis of Baltimore, G. H. Pride of New York, and P. B. Cornwall, L. L. Baker and Alvinza Hayward of this city.

THE MYSTERY OF THE SPHINX.

BY CHARLES S. ROBINSON, D. D., LL.D.

At the foot of the pyramids of Ghizeh, immediately below one who is sitting up on the ledges, there rises out of the verdureless sands, confronting the observer like a statue which looks toward him but not at him, one of the most singular creatures that ever the art of sculpture has given to the ages. A fantastic imagination of some forgotten artist has planted there in the desert an image with one of the oddest heads and one of the awkwardest bodies that can be conceived.

This is what has been known as the Great Sphinx. It is massively constructed, and carved with admirable ingenuity, but no line of any style of beauty has it anywhere to exhibit. The ears are enormous, and disreputably long; the nose is gone beyond criticism; the mouth is now ragged, thick-lipped, and uncouth; the beard is boorish; the open eyes stare blankly into space; the wig bags flatly and flaringly out on either side; the chin has lost half of its stony hair and all of its ancient semblance of dignity; the face was formerly painted, but the red color has been washed off by the sand-showers on the weather side. Altogether the structure seems pretty much gone under the effects of age and decrepitude, and has quite the look of a used-up heathen idol.

And still all tourists agree that there remains a tranquil majesty in the mien of it, which every one would recognize the moment his eyes caught a glimpse of the forehead aloft in the air. Even the fastidious Dean Stanley appears to have considered it "a giant representative of royalty." And he further pronounces that "it fitly guards the greatest of royal sepulchers." So finally he offers his testimony that "with its half-human, half-animal form, it is the best welcome and the best farewell to the history and to the religion of Egypt."

There it stands very quietly; and everybody must be allowed, with due charity, to cherish his own opinion. Coarse in its construction as a work of art, stiff and clumsy in every lineament, it is yet able, as the notebooks of a thousand visitors testify, to impress the souls of Eastern travelers with the vague sense of its greatness. It is better seen from below. The first sight of it, when caught as a part of that matchless landscape displayed from the top of the Great Pyramid, inevitably belittles and dwarfs its proportions. It looks grandest of all from the long and winding approach of the old path. Most persons know that the general figure is of a colossal form, sculptured roughly from the cliff on which it reclines; indeed, it is a lofty rock cut into a symbolic shape representing a lion lying down, with the face of a human being, erect above the forepaws,—a brute's body with a man's head and neck. The body seems to lie reclining at length in the sand; the head is poised finely, with noble features; the figure stands more than fifty feet high, and once had a royal helmet above; the stone is nummulitic, full of millions of minute marine shells, thus showing that years ago this part of the plain lay under the waters of the distant sea.

The entire effect is much lowered because of the overpowering achievement of size in the pyramids close by. Harriet Martineau has an amusing account of her eager anticipation as she went forth upon these excursions around Cairo. Always she said to herself, "Whatever else my eyes will see, they will see the Sphinx." But when she rode up toward the Great Pyramid she was so absorbed that she missed the sight altogether of this idol, and thought afterwards it had been only a heap of rock piled up there amid the interminable sands of the desert. But an attentive contemplation of it subsequently enabled her to reach, and even retain, her former enthusiasm. She says it made her half afraid of it. She noticed particularly that they had placed a man "sitting in a fold of the Sphinx's neck, as a fly might settle on a horse's mane; in that crease he reposed, while far over his head extended the vast pent-house of the jaw, and above that the dressed hair upon either side of the face, each bunch of it a mass of stone which might crush a dwelling-house; so life-like, so huge, so monstrous,—it is really fearful. The full gaze and stony calm of its attitude almost turn one to stone."

It is likely, however, that the Sphinx owes much of its singular impressiveness to the sense of mystery which for generations has inexplicably surrounded it. It is, perhaps, the most written-up and advertised curiosity in the East. Poetry and legend, painting and etching, have vied with each other in throwing a glamor around this forlorn idealization of mythology. The Bedouin say that there are spirits who in the night-time visit the Sphinx. One wears the form of a giant man; the other, that

of a beautiful boy. These move together, and may be detected by the smell of the incense which, as they burn it under the nostril of the idol, floats all through the neighboring air. It is dangerous to interrupt them in their worship at twilight, and hence no Arab child ventures out there after dark among the mysterious tombs in the ledges. The wild sons of the desert call this Sphinx *Abu'l Hol*, "The Father of Terror," and they keep shy of all contact with it.

Besides this, there is the nurses' story of Rhodopis, the maiden who, when she grew old, bewitched people that passed. In her childhood, however, she was a sweet little girl; and one day, when she was bathing away down by the great sea, an eagle bore off her shoe, and took it over the Libyan sands, clear to Memphis. There she suddenly dropped it upon the lap of the king of Egypt as he sat at judgment. And the shoe fell so strangely, and it was such a small and delicate shoe, and the beautiful embroidery upon it was so dainty, that messengers were sent over the whole land to find the owner. They caught the fleeing damsel down in Naucratis, and she was brought to the palace. Then the king married her. And when she died he built the third pyramid for her monument, even though some said she was a witch; he said she was only a beauty.

Beyond these fanciful legends there always remained the fact, everywhere admitted, that nobody knew what this Sphinx was, or who built it, or when it first saw the light, or what it was for any way. It appeared so different from everything else, that the best scholars shrank back from giving an opinion. The name of sphinx was applied to it only from some supposed resemblance which the figure had to what used to be pictured in the Greek mythology. Indeed, it has often been thought that the Egyptian term took its origin a thousand or two years after a new race of conquerors overthrew the ancient dynasties. The kings were dead and forgotten who caused these vast figures to be fashioned there in the temples, and the temples were long in ruins before the name of Sphinx was applied to their work. And it may be that it was just that sense of inexplicableness in mythology which fixed the title here.

In the Greek fable we are told that there was once a monster who was born the direful daughter of Typhon and Chimæra. She had the body of a lion, with its breast, feet, and tail, but the face and head of a female, and the wings of a bird. She was sent by Mars to avenge the death of his son, the dragon slain by Cadmus, and by Juno sent to Dionysus' city to ravage the territory of Thebes. She had been taught to make riddles by the Muses, and one of these she offered on the Phicean Hill: "What creature is that which has one voice, is four-footed, two-footed, and at last three-footed?" Those who could not answer she devoured, and the whole land fell into awful fear. The oracle told every one who asked for help from the gods that Thebes could not be freed until some one should solve the Sphinx's riddle. Finally Creon, who, at the time, was king, lost his son, seeing him devoured by the monster. A proclamation followed, that whoever should answer the Sphinx should be the king of Thebes and have the monarch's sister Jocasta for his wife. Œdipus then came from Corinth into Egypt, and at once answered the enigma. "Man," he said, "is the animal which has but one voice; in his infancy he is four-footed, for he creeps on his hands and feet; but he goes on two feet when he is grown, and, when old, he carries a staff for his help." Then the Sphinx, conquered, flung herself down and died.

This was the Grecian story, but it had no connection with the Egyptian theology, and the Sphinx at Ghizeh was in its place a thousand years before the Greeks came to reign in the land of the Pharohs. It is useless to wander around among the scholars. They differ with each other, and sometimes grow fierce. Mariette says the idol belongs away back in the fourth dynasty; Cheops (who is supposed to have erected in the oldest times the Great Pyramid) found it dilapidated, and gave it a new life with some needed repairs, and so immortalized his name. Then comes Brugsch Bey, saying that this statement of Mariette "bears a lie on the face of it." And Piazzi Smyth actually grows spiteful at these efforts to bring the image any more into notice; he declares that this mutilated object is only an image of superstition, fairly obscene with its idolatrous impiety, unfit to be in the neighborhood of the pyramid or associated with its name. His language grows almost amusing in its explosion of petulant temper: "That wretched Sphinx, I repeat, need be no more referred to again by any Christian man, woman, or child, looking for instruction to the Rock of Ages alone," thus he concludes.

There is no necessity now, certainly, for further keeping up the sense of mystery which has had so much to do with the fame of this image. For everything which any one wants to learn, is told us by George Ebers, and Miss Edwards adds the latest confirmation. The sand, which covered all the front of the idol, has been excavated; something looking like a temple or votive chapel was found just between the paws the lion extends along the face of the rock; statues of King Khafra, three in number, one of which is now in the Bulak Museum, were standing quietly waiting to be dug up and to tell their story. The making of this rock into a figure of a deity was begun by Cheops; it was finished under the direction of King Chefren; and it was dedicated to Harmachis, the God of the Rising Sun. This is learned from a large tablet covered with hieroglyphics which was found fixed upon the breast of the animal down beneath the sands of the ages. There used to be an altar in one of the chambers, and this was so located that the sweet savor of a sacrifice might most easily be supposed to reach the god's nostrils.

That is to say, there is no longer any mystery of the Sphinx; it represents a transformation of the deity Horus, so an inscription discovered lately at Edfu relates; the god, in order to vanquish Typhon, the evil spirit, took the shape of a human-headed lion, thus he arose upon the imagination of those ancient idolaters in the remote past for their worship. Hence the Sphinx was the colossal embodiment of Egyptian idolatry at its highest power and basest degredation. The sun-god was not equal to his own defenses, and the structure lies in ruins. A strange sort of beauty must once have graced it as a thing of art; but the Mamelukes used the big head for a target when they practiced their artillery in shooting. That was what broke the nose and tore fragment after fragment out of the wig and the beard and the chin. Then the open desert invited the winds to come and bury the enclosure below; and so the old battered creature gazes out across the ages, lonely and lost in its vain attempt to summon its friends for rescue, with the far-off look of a deserted monarch. And so Egypt stands crownless to-day; the obelisks, the pyramids, the sphinxes—all are desolate. They lingeringly proclaim their own humiliation before their conqueror. And that was what the Lord said by his prophet in his Word: "He shall break the images of Beth-shemish that is in the land of Egypt; and the houses of the gods of the Egyptians shall he burn with fire." This was what the sad Jeremiah wrote while he was an exile in that country; his eyes had to bear the pain of sights he saw, but he hoped on and kept the faith.

It seems to me, that, if I were asked to offer a convincing proof of the certain fulfillment of Divine prophecy, I should be willing just to rest my case upon the picture which is here suggested. Could Jehovah, the living and true God, show more conspicuously the depth of the contempt and derision in which he holds these idols of the ancient mythologists of Egypt, than by exhibiting them in this plight of ruinous dilapidation? There they stand, battered and deserted, amid the rifled graves of their forgotten priests. Imagine the scene with the infidel and alien race of Mamelukes training their guns upon the temples where the Pharaohs worshiped their highest deities with incense and the bodies of beasts, and laughing with jeers of applause and congratulations whenever a better shot than usual shows by the little cloud of dust in the air that the cannon-ball nipped on the nostril of the Sphinx.—*Sunday School Times.*

STUDENT'S COLUMN.

Relief (re-leef), Rilievo (ré-le-á-vo). The projecture or prominence of a figure above or beyond the ground or plane on which it is formed.

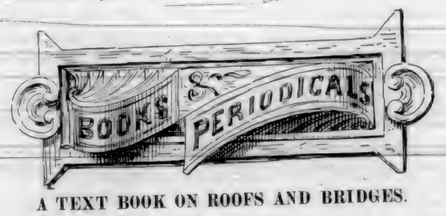
Relief is of three kinds, namely, low relief or bas relief (bä-re-leef); bass relief (bás-re-leef); basso rilievo when the figures do not stand out far from the plane on which they are formed, as in medals, festoons, foliage, etc.; demi relief, demi rilievo, when one half of the figure rises from the plane; mezzorilievo (met-*or*-med-zo-re-le-á-vo), a middle degree of relief in figures between high and low relief; high relief, alto relievo or alto rilievo the projection of a figure half or more, as when a figure stands completely out from the ground, being attached to it in only a few places.

Intaglio (in-täl-yo) is a figure cut into a material, as a seal, matrix, or the like, so as to form a depression or hollow.

PERSONAL.

John McArthur, Jr., the well-known architect of Philadelphia, is dead. Mr. McArthur has held high positions during his lifetime, having been architect for the War Department during the war. His greatest work, however, is the Philadelphia City Hall, now in the course of erection, and which has already cost $14,000,000.

I. K. Pond, of Pond Bros., Architects, Chicago, has come to this Coast on a pleasure trip.



A TEXT BOOK ON ROOFS AND BRIDGES.

PART II—GRAPHIC STATICS.

—BY—

Prof. Mansfield Merriman and Henry S. Jacoby.

The above is the title of a new book just issued by John Wiley and Son, New York, 15 Astor Place. It treats of the *Analysis of Stresses* by graphic methods, together with additional matter so as to form a tolerably complete treatise on Graphic Statics, as applied to the discussion of common roofs and bridges. Abbreviated methods are employed in calculating wind stresses.

A novel feature of the book is that every other leaf is a blank, and of a suitable quality of paper, upon which drawings can be made, and new problems worked out with the assistance of given problems on the adjacent leaves. It is a text book that will be of great value in an Architect's or Engineer's library.

NOTES & COMMENTS.

Supervisor Bingham proposes an ordinance removing the Chinese quarter to the Potrero.

About $2,000,000 is the value of the lumber trade of Portland, Or. and vicinity.

It is estimated that the Southern Pacific Railroad Co. lost over one and one-quarter million dollars by the recent storm in the mountains.

The Saw Mills in the Puget Sound region are said to have a total capacity for 1,000,000,000 feet of lumber per year, of which the output is about 750,000,000 feet.

In a certain locality in Boston $2,000,000 is estimated to have been spent upon buildings all situated within a radius of one quarter of a mile.

In the suit of Pissis & Moore against Dr. J. H. Stallard, the Justice Court decided in favor of the plaintiffs, notwithstanding the contract had not been recorded.

Washington State has an increasing industry in the cedar shingle manufacture, which amounted to nine million shingles for the past year at a valuation of over two and one quarter million of dollars.

The Illinois State Chapter, A. I. A., has been formed by a consolidation of the Chicago Chapter, A. I. A., with the Illinois State Association of Architects. A committee was appointed to consider the rental of a room at $1,000 per year, on the third floor of the Art Institute. It was decided to make the annual dues of the new body not less than $15 per annum.

The contractor or builder should never prepare the drawings and specifications. *He is on the other side of the case.* A learned judge once said that "a contractor preparing the drawings and specifications of work that he is to perform for a party who has little or no technical knowledge of the subject, is like the opposing lawyer preparing both sides of the case." However honest he may be, such a lawyer and such a contractor will give his own side the advantage.—*Ex.*

The Senate will probably appropriate the following amounts for public buildings: Oakland, Cal., $300,000; Cheyenne, Wyoming, $150,000; Helena, Mont., $150,000; Salt Lake City, Utah, $500,000; Stockton, Cal., $85,000; Mammoth Hot Springs, Yellowstone National Park, $10,000; Portland, Or., $500,000; Virginia City, Nev., $75,000; Hastings, Neb., $150,000; The Dalles, Or., $100,000; Salem, Or., $100,000; Reno, Nev., $75,000; San Diego, Cal., $300,000.

Statistics recently tabulated show that there was consumed during the past year of clay products in building in twelve of the leading cities, the following number of brick: New York City, 1,000,000,000; Chicago, 440,000,000; Philadelphia, 300,000,000; Boston, 150,000,000; St. Louis, 200,000,000: Washington, 125,000,000; Cincinnati, 100,000,000; Cleveland, 84,000,000; Omaha, 80,000,000; Pittsburg, 80,000,000; New Orleans, 36,000,000; Indianapolis, 35,000,000; making a total for these cities of 2,730,000,000, which merely hints at the enormous consumption in the country at large.—*Ex.*

Governor Hill, of New York, in a recent message to the legislature, suggested that in view of the unsatisfactory condition of the county roads, the State should construct in every county two roads intersecting each other in about the center of the county, connecting with similar roads in the adjoining counties and so form a system of State roads to be kept in repair at the expense of the State. The advantage to be gained would be convenient means of communication between different parts of the State, whether near or far. If this idea is carried out successfully in New York there will be an excellent precedent for other States to follow, and thus make public highways over the length and breadth of the nation.

A project is on foot to build a large salt water bathing establishment on the northwest corner of Sutter and Stockton streets; the water will come direct from the ocean, through several miles of pipe; the building will be a handsome structure, containing, besides a large number of single bath-rooms, one large plunge bath 50x100 lined with marble and two smaller plunge baths for private clubs whose membership will be limited to two hundred. One club being composed of ladies, and the other of gentlemen. Mr. Wm. Greer Harrison is at the head of the enterprise; the company has its office at 305 California street, and is known as the Pacific Ocean Bathing Corporation. Such an enterprise should be made a very profitable one—at present would-be bathers have long distances to go to enjoy the pleasures of a swim in salt water, and yet there are many who put up with the discomforts of a long ride and the consequent loss of time, for the sake of the pleasure they take in a dip.

M. Pechard, the French chemist, has discovered a new substance, called "oxalomolybdic acid," being composed of oxalic and molybdic acids. The crystals of this new acid can be kept unchanged both in light and darkness, but soon become blue if moistened and placed in the sun. When it is used upon paper it will not appear distinct unless put under the strongest sunlight, which turns it to a deep blue. However, this only happens when the solution is spread over some surface, as in the bottle it remains unchanged. To use it for photographic purposes, dip a sheet of paper into a saturated solution, dry in the dark, and then expose behind a common photographic negative for about ten minutes, when a very sharp blue print is obtained. If placed in contact with water, the color immediately disappears, thus allowing one to write upon a piece wholly exposed to the sunlight with a pen dipped in water; but heat this blue print once, and it turns a jet black, which water cannot change.

The American Fine Arts Society has been organized with a capital stock of $50,000, besides which a gift fund was raised of upwards of $30,000, now reported to have reached $200,000, contributed chiefly by Cornelius Vanderbilt, George Vanderbilt, C. T. Barney, John D. Rockfeller, Robt. Gorlet, Henry G. Marquand and John D. Archibald. The Architectural League, Art Students' League, Society of American Artists, New York Art Guild and Society of Painters in Pastel, have united with the organization. A building is to be erected in New York soon in which exhibitions can be held and the study of Art pursued.

"The formation of this powerful union", the committee having the matter in charge announces, "is doubtless the most important step yet taken in the establishment of a true school of American Art. It will correspond to the Ecole des Beaux Art in Paris. It brings together no less than three hundred artists and architects of merit and as many more ambitious students. This Union is destined to become the Art power of the country.

Plans have been drawn for another suspension bridge across the Hudson, at a point where the river is narrowest, between Hoboken and Fourteenth streets, New York. Gustav Lindenthal is said to be the projector of the work, which is to be carried out by the North River Bridge Company, of which Jordan L. Mott, of the Mott Iron Works, New York, W. A. and W. F. Roebling, the famous bridge builders, are amongst the principal incorporators. The bridge is to have but a single span, 2,850 feet in length, thus outstretching the much talked-of English Channel bridge, whose longest span will be only 1,700 feet. To place a pier in the center of the river would incur a greater expense than a single span, as it is two hundred feet down to rock formation. The bridge will be 150 feet above the river and will be constructed of open hearth steel wire. The Brooklyn bridge was built with crucible steel wire that cost eight cents a pound, while the material now to be used is estimated at half that price. There will be six railroad tracks crossing, and the length of time taken to build is computed at not more than seven years, unless delayed by legal proceedings.

WARFARE ON OAK TREES.

"The world seems to have waged a special warfare upon oak trees," says a St. Louis man. "Before iron ships were built, and that was only twelve years ago, oak was the only thing used. When this drain ceased oak came into demand for furniture, and it is almost as expensive now as black walnut. No one feels the growing scarcity of oak like the tanner, and the substitution of all sorts of chemical agencies leads up to the inquiry as to whether other vegetable products cannot be found to fill the place of oak bark. The wattle, a tree of Australian growth, has been found to contain from twenty-six to thirty per cent. of tannic acid. Experiments have been made on the Pacific Slope, where the wattle readily grows, and in a bath of liquor, acid was made from it in forty-seven days, whereas in liquor made from Santa Cruz oak, the best to be found in all the Pacific States, the time required is from seventy-five to eighty days. The wattle will readily grow on the treeless plains of Texas, New Mexico and Arizona, the bark of which ought to yield five dollars per acre, counting the fuel as nothing."—*Invention.*

CAUSE OF THE TRACY FIRE.

Result of Building-Inspector Entwisle's Investigation.

Complying with your order to make an examination to ascertain, if possible, the origin of the fire in the building, 1634 I street northwest, owned and occupied by the Hon. B. F. Tracy, I have the honor to report that I have made a thorough examination of the building, and it is evident from the condition of the house that the fire first started on the west side of the front parlor on the main first floor, and its rapid progress was no doubt caused by the fire getting behind the wall paneling. The room was lined its entire height with panel work on all the walls, leaving small chambers through which the fire passed around the entire room and through the floor to the second story. It also passed out into the hall and by currents rapidly up the stairway, cutting off all chance of escape from the upper floors. The building was heated by low pressure steam, on the indirect system, and in tracing the supply to the different localities of coils and coil chambers there is no evidence that the fire originated from the heating apparatus or from any chimney flue, but immediately under the point where the fire started there was situated in the basement a pump run by a Bunsen gas-burner, and it is possible that this may have been out of order, allowing the gas to escape to the room above, and the fire started by an explosion of gas. This building was erected in 1876, and there is evidence that it was carefully and safely constructed. An addition was made during last season on the east side, and the mansard roof removed from the front and the front all carried up. This last portion is damaged principally by smoke and water; nor was the basement of the old portion burned; the fire starting on the floor above, but that was greatly damaged by water. I cannot positively decide the origin of the fire, but the escape of gas and the explosion of gas seem the most probable cause.—*National Builder.*

ADOBE HOUSES IN LOUISIANA.

The following description of building the old style adobe houses in Louisiana when that peculiar style of architecture was a necessity, will be found interesting: Friends and neighbors were invited in sufficient number with ample refreshments made and provided. A place was selected convenient to the building with loamy soil suitable for brick, and a hole was dug of sufficient size for the quantity of material required. This, after deep spading, was watered to the consistency of brick mortar. Then green moss, of which a sufficient pile had been provided beforehand, was spread like a gray blanket over the mortar bed, when a certain number of men, barefooted, with trousers rolled up above their knees, tramped the circle, crushing in the moss to the bottom of the loose earth. Then came another layer of moss and another tramping and so repeated till the pit was full to the top of adobe—moss and clay. This material was then pulled out by blankets or sections as it was tramped in and taken to the building already completed except the wall or weather boarding for which this mixture was the substitute. In sections of country where there was no Spanish moss, prairie grass or hay was used as a poor substitute. Beginning at the sill they went up, firmly driving sticks nearly horizontal between the studding about every six inches, to hold the mortar to its place, and when finished, these sticks were in the center of the wall. This, when half dry, was shaved off with a sharp spade and left to dry, and when well whitewashed made a solid and pretty wall, cool in summer and warm in winter.—*The Journal of Building.*

CITY BUILDING NEWS.

Buchanan and Washington. Owner, Isaac Strassburger; architect, SAM'L NEWSOM; contractor, Geo. R. Lang; surety, Frank P. Latson, $4,000; cost, $13,500; signed, Jan. 28; filed, Jan. 31; payments, 75 per cent. on 1st and 15th of each month as work progresses, balance 35 days.

Buchanan and Geary. Carpenter work; owners, Miss B. K. Dunne, et al; architect, CHAS. J. I. DEVLIN; contractors, John Blake, et al sureties, J. Sullivan and J. T. Lynch, $1,500; cost, $2,554; signed, Jan. 9; filed, Jan. 13; time, 6 weeks; payments, 75 per cent, as work progresses, balance 35 days; artificial stone work, contractor, Geo. Goodman; surety, Geo. Richardson, $1,000; cost, $1,575; filed, Jan. 13; payments, same as above.

Bush and Lyon. Frame cottage; owner, W. I. Morgan; architect, M. J. BUGBEE; contractor, A. J. Wheeler; cost, $1,821; signed, Jan. 13; filed, Jan. 14; payments, $456, enclosed; $456, brown coated; $456, accepted; $456, 35 days,

Buchanan and Washington. To build; owner, Isaac Straburger; architect, Samuel Newsom; contractor, Geo. R. Lang; cost, $10,350; surety, F. Latson. $4,000; signed and filed, Feb. 12.

California, between Stockton and Powell. Dwelling; owner, F. Hess; architects, Townsend & Wyneken; contractor, R. O. Chandler; signed, Jan. 8; filed, Jan. 18, cost, $5,097; payments, $950, framed; $950, enclosed; $950, trimmed, etc.; $962, completed; $1,275, 35 days.

Clara Avenue and Seventeenth street. Cottage; owner, P. W. Braas; contractor, Gustave Pavel; cost, $1,688; signed and filed, Jan. 29; payments, $300, mortar on; $600, completed; $588, 35 days.

Clayton, near Page. 2-story frame; owner, Henrietta Maynard; architect, SAMUEL NEWSOM; signed, Jan. 18; filed, Jan. 28; cost, $4,300; payments, 75 per cent. on the 1st and 15th of each month, as work progresses; balance, 35 days.

Devisadero and Waller. 2-story frame; owner, Annie Green; architects, Shea & Shea; contractor, J. B. Taubman; sureties, F. G. Norman & J. Beaumant; signed, Jan. 9; filed, Jan. 14; cost, $5,460; payments, $1,023, enclosed; $1,024, rough plumbing in; $1,024, outside primed; $1,024, completed; $1,365, 35 days.

Devisadero near Clay. 2-story frame; owner, Mrs. E. M. Carter; contractors, John B. Gonyeau Bros. architects; sureties, G. W. and C. A. Hooper, $4,000; signed, Jan. 14; filed Jan. 16; cost, $11,800; time, 110 days; payments, $2,950, frame set up, etc.; $2,950, brown coated; $2,950, finished; $2,950, 35 days.

Dolores and Nineteenth. To build; owner, S. Hortop; architect, S. HATFIELD; contractor, C. Peterson; sureties, A. W. Starbird and W. Bennett, $2,000; signed, Jan. 20; filed, Jan. 22; cost, $3,600; payments, $666; roof boarded, $668; first coat mortar on, $666; plastered, windows in, $700, completed; $900, 35 days.

Douglas Street. 2-story frame; owner, Bridget Carr; architect, T. W. McKee; contractors, W. C. Aickley, et al; signed, Jan 25; filed, Jan. 27; cost, $1,600; time, 60 days; payments $500; ready to be enclosed; $200, brown coated and floor laid; $500, windows hung; $300, completed; $100, 35 days.

Ellis and Powell. Owner, Edward Auzerais; architects, PISSIS & MOORE; signed, Jan. 13; filed, Jan. 16; payments, 75 per cent. on the 1st and 15th of each month as work progresses; balance, 35 days. Carpenter work, J. W. Wissenger; cost, $20,885. Brick and stone work, Richardson & Gale; cost, $20,900. Wrought-iron work, Bigelow & Little; cost, $1,462. Cast-iron work, O'Connell & Lewis; cost, $2,560. Plumbing and gasfitting, Fritz & Kean; cost, $2,574. Painting, J. St. Denis & Co.; cost, $1,423. Total cost, $52,686.

Geary and Gough. Interior additions to church; owner, First Lutheran Church; architect, Samuel Newsom; contractors, Fink & Schindler; cost, $2,025; signed and filed, Feb. 12.

Harrison and Eleventh. Alterations; owner, James Moran; architect, W. H. ARMITAGE; contractor, S. T. Green; surety, Frank P. Latson; signed, Jan. 18; filed, Jan. 28; cost, $2,625; time, 60 days; payments, 75 per cent. as work progresses; balance, 35 days.

Laurel Hill Cemetery. Mausoleum; owner, James L. Flood; architect, Wm. Patton; contractors, Patrick Deegan, et al; signed, Dec. 5; filed, Jan. 21; cost, $66,700; payments, 75 per cent. as work progresses; balance, 35 days.

Lyons and Washington. 2-story frame; owner, Perry Stinson; architect, P. R. Schmidt; contractor, J. O'Connell; signed, Jan. 15; filed, Jan. 21; cost, $2,100; time, 90 days; payments, $575, enclosed; $575, brown coated, etc.; $575, hard finished, etc.; $575, completed; $900, 35 days

McAllister and Webster. Two houses; owner, Elizabeth Gluck; architects, John & Balczynski; contractor, Adam Miller; signed, Jan. 20; filed, Jan. 23; cost, $14,200; payments, $3,000, frames up; $2,500, enclosed; $2,500, rough mortar on; $2,650, ready for paint; $3,550, 35 days.

McAllister and Larkin. Cast-iron work for 5-story brick; owners, J. G. and T. N. Day; architect, T. J. WELSH; signed, Dec. 2; filed, Jan. 13; cost, $9,300; payments, 75 per cent. as work progresses; balance, 35 days.

Pierce and Fell. To build; owner, C. Westphal; architect, H. GEILFUSS; contractor, John F. O'Brien; signed, Jan. 20; filed, Jan. 23; cost, $3,770; payments, $865, frame up; $865, enclosed; $865, brown coated; $ 65, white coated; $865, completed; $1,445, 35 days.

Pine and Polk. To build; owner, John Hemphill; architects, B. McDOUGALL & SON; contractor, John H. McKay; signed, Jan. 9; filed, Jan. 20; cost, $14,400; payments, $1,800; excavating done, etc.; $2,000, ready for second tier of joists; $1,800, roof boarded; $1,200, brown coated; $1,200, sash glazed and hung; $2,800, completed; $3,600, 35 days.

Pine, between Franklin and Gough. Frame dwelling; owner, G. M. Davis; architect, W. O. Banks; contractor, J. G Adams; sureties, F. Joost and S. H. Harmon; signed, Jan. 22; filed, Jan 29; cost, $8,870; time, 130 days; payments, $1,500, first story joists in position; $2,640, brown coated; $2,500, completed; $2,229, 35 days; Another dwelling, costing $8,660; same description in other respects; payments, $1,500, first story joists in position; $2,490, brown coated; $2,500, completed; $2,170, 35 days.

Pine and Polk. To build; owner, J. J. Conrad; architects, B. McDougald & Son; contractor, J. H. McKay; cost, $4,680; signed, Feb. 10; filed, Feb. 13.

Pine and Kearney. Carpenter work; owner, S. P. Blumenberg; architect, Fred E. Wilcox; contractor, N. C. Post; cost, $1,250; payments, 75 per cent. as work progresses; balance, 35 days.

Stockton and O'Farrell. To build; owner, Schiever Levy; architects, Schulze & Meeker; contractors, McGowan & Butler; cost, $20,500; signed, Jan. 22; filed, Jan. 23; time, July 15, '90; payments, 75 per cent. as work progresses; balance, 35 days.

Stockton and Vallejo. To build; owner, Robert R. Hind; architects, Ashton & Stone; payments, 75 per cent. as work progresses; ballance, 35 days; filed, Jan. 14; contractors, Faucher & Connor for brickwork, etc.; cost, $24,900, with F. Joost and O. H. Greenwald, $10,000; Henry Williamson for plumbing, gasfitting, etc.; cost, $3,028; the Gray A. S. P. Company for patent stone walks; cost, $1,100; E. J. Mosley for painting; cost, $1,625.

Scott and Vallejo. To build; owner, R. K. Palache: architects, Smith & Freeman; contractor, R. P. Sanchez, signed, Jan. 20; filed, Jan. 21; cost, $4,595; payments, $500; second story joists on: $1,100, covered in; $803.25, plastered; $973, completed; $1,128.75, 35 days. Plumbing, Duffy Bros.; filed, Jan. 23; cost, $522; payments, $195, rough plumbing in: $195, completed; $132, 35 days.

Scott and Jackson. Foundation etc.; owner, Albert Gallatine; architect, Clinton Day; contractor, John McCarthy; cost, $18,984; signed, Feb. 10; filed, Feb. 13; time, Aug. 31, '90; payments, $6,000, brickwork ready to build; $5,000, to second floor joists; $3,215, completed; balance, 35 days.

Taylor, No. 1517. Repairing, except plumbing, etc.; owner, Martha Scooffy; contractor, Wm. Berry; signed, Jan. 10; filed, Jan. 17; cost, $1,037; payment when completed; time, 35 days.

Townsend near Second. To build; owner, John G. Adams; architect, CHAS. I. HAVENS; contractor, Jos. Moore; signed, Jan. 21; filed, Jan. 27; cost, $6,468; payments, $1,600, rough frame up; $1,600, enclosed; $1,618, completed; $1,650, 35 days.

Van Ness Avenue and O'Farrell. Mill work and inside finish; owners, Mahoney Bros.; architect, T. J. WELSH; contractors, P. A. Buell & Co.; signed, Jan. 28; filed, Jan. 30; cost, $15,000; payments, 25 per cent. as work progresses; balance, 35 days.

Van Ness Avenue and O'Farrell. Stairwork and steps; owners, Mahoney Bros.; architect, T. J. WELSH; contractors, Drew & McLaughlin; signed, Jan. 22; filed, Jan. 24; cost, $6,000; payments, 75 per cent. on the 1st and 15th of each month, as work progresses; balance, 35 days.

Waller and Octavia. Completion of 2-story frame; owner, Pauline D. Skadberg; architect, M. J. WELSH; contractor, August Deischer; signed, Jan. 29; filed, Jan. 31; cost, $1,275; payments, $425, brown mortar on; $425, completed; $425, 35 days.

Washington, between Polk and Van Ness Avenue. Brickwork; owner, Clark Blethen; architects, Percy & Hamilton; signed, Jan. 20; filed, Jan. 25; cost, $1,450; payments, 75 per cent. on the first Saturday night of each month; balance, 35 days. Carpenter work, same as above, except contractor is J. B. Gonyeau, and cost, $5,781.

Oakland.

Market and Twelfth. High School; owner, City of Oakland; architect, W. J. Mathews; contractor, Robt. Smillie; signed, Jan. 11; filed, Jan. 14; cost, $14,385; payments, $2,157.75, as one-fifth of the work is completed.

Chestnut and Tenth. 2-story frame; owner, Chas. Young; architect, Chas. Mau; contractor, M. Jackson; signed, Jan. 15; filed, Jan. 16; cost, $2,161; payments, $840.25, as one-third of the material is furnished and work done.

Tenth Avenue, between 17th and 18th streets. Cottage; owner, Edward Dolan; architect, Thos. McGauley; signed and filed, Jan. 20; cost, $1,680; time, seven weeks from date.

Washington and Twelfth. Painting; owner, M. K. Blake; architect, W. J. Mathews; contractor, Al. Wood; cost, $1,125; payments, 75 per cent. as work progresses; balance, 35 days.

Cypress and Sixteenth. To raise building; time, 60 days; owner, Sallusch Scheyer; contractor, J. C. Johnson; cost, $1,890; signed, Jan. 23; filed, Jan. 30; payments, $700, rustic on; $650, first coat of mortar on; $450, 35 days.

Webster and Fourteenth. To build; time, 45 days; owner, Mrs. E. E. White; architects, J. J. and T. D. Newsom; contractors, Wm. Sturgeon & Son; cost, $3,600; payments, $700, rustic on; $900, floors laid; $1,000, completed; $900, 35 days.

Alameda.

Encinal Avenue and Morton street. To build; owner, Frederick Wild; contractors, A. W. Pattiani & Co.; cost, $4,190; time, April 15 '90; signed, Jan. 9; filed, Jan 13; payments, $900, chimneys built; $800, exterior primed; $600, completed; $890, 35 days.

Encinal Avenue and Morton street. 1-story frame; owner, L. W. Sanborn; contractor, A. R. Benke; signed, Jan. 27; filed, Jan. 28; cost, $3,900; payments, $800, roof on; $1,000, windows fitted; $1,000, 35 days; time, May 1, '90.

Union and San Antonio. To build; owner, A. W. Fink; contractors, A. W. Pattiani & Co.; cost, $4,145; signed, Jan. 29; filed, Feb. 1; time, May 1, '90; payments, $1,300, chimneys built; $1,100, brown mortar on; $820, when completed; $1,125, 35 days.

Fresno.

F. Banta has been awarded the contract for an engine house to cost $5,170.

Santa Rosa.

T. J. Furbee has drawn plans for a $13,000 church on Mendocino street.

Antioch.

A new school house to cost $11,740, contractor J. B. McKenzie of Benecia.

San Rafael.

Hotel Rafael property, three cottages; contractor, C. Chisholm; cost, $15,500; and tower, cost, $6,000. Residence, costing $5,600, for L. Gerstle.

Livermore.

M Street. Cottage; owner, Wm. Thorn; contractors, Palmer, Hunter, Taylor & Wilder. Second and K streets. Cottage; owner, Joseph Fletcher. Arroyo Valle. Building; owner, J. C. Keene.

Oregon.

W. J. Snodgrass is building a $20,000 planing mill of three stories at Oro Dell near La Grande. Also at the latter place it is reported plans for 50,000 three-story brick hotel soon to be built.

Washington.

Plans and specifications for a three-story building in Cosmopolis to cost $40,000 have been drawn.

Whatcom Court house designs have been submitted. The cost of the building which is to be of brick, will be $65,000.

Seattle is to have a shoe factory costing $100,000. W. J. Ilman, of Boston, is the projector.

TACOMA.

Five-story brick warehouse. Owner, F. S. Harman & Co.; architects, Farrell and Darmer; cost, $20,000.

Building. Owner, M. J. Cogswell; architect, S. Bertelson; cost, $6,000.

Residence. Owner, F. Dittmore; architects, Farrell and Darmer.

C. Langlois is drawing plans for the National Bank of Commerce, of a six-story brick and stone building to cost $100,000.

Montana.

Supervising Architect Bell of Washington, has written to Postmaster Curtis, for information concerning the needs of Helena's Government officials, with the idea of drawings up plans for a public building.

Los Angeles.

Alpine Plaster and Cement Company, wooden building, corner Alameda and Washington streets, $20,000.

W. S. Reevis, frame dwelling, Water street, between Reservoir and McDuff streets, $1,316.

Pierre Nicholas, brick store and rooms above, northeast corner Marchessault and New High streets, $5,000.

Mrs. Jennie Harbert, frame store with rooms above, Hain street, near Thirty-third street, $1,000.

Mrs. Sallie Harkness, frame building, Adams street, lot 1, St. James Park tract, $5,500.

Mrs. J. C. McMenomy, frame dwelling, 741 Hill street, $4,600.

State of California, frame gymnasium, Normal school grounds, $9,500.

K. Messer, brick store, corner Rose and First streets, $1,000.

W. C. Furrey, frame dwelling, corner Orange and Farragut streets, $4,000.

City of Los Angeles, two-room frame school house, corner Pritchard and Flora streets, $2,900.

City of Los Angeles, two-room frame school house, corner Swain street and Griffin avenue, $2,900.

City of Los Angeles, four-room frame school house, corner Vignes and Thomas streets, $8,508.

City of Los Angeles, four-room frame school house, Beaudry street, $8,508.

City of Los Angeles, eight-room frame school house, Sixteenth street, $13,997.

City of Los Angeles, eight-room frame school house, corner Ninth street and Stanford avenue, $13,997.

City of Los Angeles, two-room frame school house, First and Savannah streets, $3,495.

City of Los Angeles, four-room frame school house, Conwell and Grant avenues, $7,750.

City of Los Angeles, four-room frame school house, Collado street, $8,989.

City of Los Angeles, four-room frame school house, corner Alpine street, $9,393.

City of Los Angeles, brick high school building, Castelar street, $59,300.

JOHN H. WISE, President. H. T. SCOTT, Vice-President. CHAS. H. FROST, General Manager. C. S. PREBLE, Secretary

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE ARCHITECTS, meets second Friday of each month at 408 California Street.
SETH BABSON, Pres. W. P. MOORE, Vice-Pres.
OLIVER EVERETT, Sec. JOHN W. CURTIS, Treas.

TECHNICAL SOCIETY, meets first Friday of each month at 408 California Street.
JOHN RICHARDS, Pres. PROF. FRANK SOULÉ, Vice-Pres.
OTTO VON GELDERN, Sec. JAS. SPIERS, Treas.

AT a special meeting of the SAN FRANCISCO CHAPTER OF A. I. A. held Feb. 28th, a committee was appointed to confer with the Directors of the Mechanics' Institute, concerning the proposed improvements to their property.

The regular meeting of the Chapter was held on the 14th of March, at which the usual routine of business was transacted.

At a regular meeting of the Technical Society of the Pacific Coast an interesting paper was read by Otto von Gelden on the history and construction of the Dry Dock at Mare Island, near San Francisco. The character of the ground, the construction of coffer dam adopted to carry the excavation some 35 feet below low water mark and the system of piling was fully described. The "gravity" mixer for concrete work was illustrated by drawing and the method of working described. The masterly economy of political engineering was lightly touched upon; one instance, a synopsis of which may be stated thus, "the powers that were" sent out a number of gun powder pile drivers, one of which cost some $1700 and a royalty of $3000 paid for the privilege of using it. A twelve horse power steam engine with steam up was kept in position in order to raise the piston when the powder failed in its work. About five per cent. of the piles were driven with this wonderful machine. The work was begun in 1873, is not yet finished, and up to the present time has cost two and three quarter million of dollars. The discussion on the ubjects was continued till next meeting. An agent from an eastern manufacturing house, exhibited improved instruments for engineers, surveyors and architects. The level had an improved arrangement for detaching and re-adjusting the level to swivel stand. The transits shown had improved side standards whereby increased strength was gained; and more firmness given to the pivots of the tube, the scale on the circle being cut a short distance back from the edge and a vernier arranged for reading same; by this arrangement the scale will remain legible for a longer period than if cut to the edge. The regulating screws are worked by yokes against all movable joints which reduces the inaccuracy by wear to a minimum. A new form of draughtsman's scales was shown, and will soon be placed in the market, which consists of a layer of white celluloid let into the common wooden rule, thereby making a scale equal to one of ivory at a slight cost over one of wood.

THE proposition laid before the Mechanics' Institute to offer prizes for a scheme of utilizing this property commends itself as a sensible method of arriving at the best solution of the problem which stares the Institute Directors in the face. When this has been thus settled upon, definite instructions could be formulated for the guidance of architects to enter the final competition. Unless these definite instructions are given a great waste of work will be the result, as a good design in every other way through failure to fit in with the scheme of the Directors may be laid aside to the loss both of the public and the architect involved.

We are afraid that public spirit alone will not suffice to bring the best talent to bear upon this question and a stimulus of a money reward is required. And money spent upon this object

would very likely have the effect of saving a vast amount in the future.

The problem before the Institute seems to resolve itself into which of the following propositions, among others, would be most conducive to the welfare of the Institute and at the same time to the welfare of the citizens of San Francisco, its constitutents.

1st. The removal of the Fair building to Folsom St., selling the Library building on Post St., and erecting a new Library building and hall on Larkin St. property with or without stores attached.

2nd. Selling both the present building and the Folsom St. property and concentrating both the Exhibition Hall and the Library upon the Larkin St. property again with or without stores.

There are other plans than these that may commend themselves, but these two seem the principal ones under consideration.

Now, sketch plans say to a scale of 20 feet to 1 inch showing what could be done with the different pieces of property to the best advantage would without doubt be an immense help to the arrival at some good result, and lead to a great deal better understanding by the Directors of their position. Such a proposition deserves very serious consideration on their part before rejection.

CHICAGO appears to have distanced all competitors in the race for the World's Fair, and we tender our congratulations. Chicago is a representative American city, full of energy, push, and if you will, of *cheek*. With the well known business activity of her citizens, it is a foregone conclusion that she will do every thing possible to make the important event an entire and complete success.

New York lost her chance through an unfortunate combination of circumstances and naturally feels pretty sore over the matter, and is somewhat disposed to say disagreeable things about her fortunate rival. However, she will have to take her loss philosophically and after she has had a little time to get over her disappointment will doubtless join the procession and give as much aid as she would expect to receive had the conditions been reversed.

THE *Canadian Architect* expresses the hope that the bill respecting the practice of architecture in the province of Ontario will become a law. It provides that before any man can be registered as a qualified architect, he must pass such examinations as may from time to time be determined on as sufficient to ensure his having a fair knowledge of architecture in all its branches. It is designed to give the public information as to the qualifications of the men they employ, so that if they choose to employ incompetent persons or none at all, they will only have themselves to blame for faulty construction or defective bnildings.

It then goes on to say:

It will be argued that the object of this Act is to make the profession of architecture a close profession, solely to the benefit of its members and not necessarily for the benefit of the public, and that the public does not desire that such a Bill should pass. There is nothing in the Bill constituting the profession of architecture a close profession, but even if there were, we maintain that the public has shown in many ways that none but qualified men should be allowed to practice as architects. The newspapers, as representing the public, are always complaining of defects in buildings, resulting, as they maintain, from the ignorance of architects. Well, if there is this ignorance on the part of some architects, something should be done to weed the ignorant out of the profession and leave only the intelligent, as it would appear that the public is not capable of selecting the competent from the incompetent, or such mistakes would not occur, since there are qualified men, though not in such numbers as the unqualified. Unless there is a standard, the competent man cannot say to the incompetent one that he is not a properly qualified architect, and that he should not claim to be an architect, as he injures the standing of the profession and calls down upon it the condemnation of the public. If he did, he would only be laughed at for his impertinence.

Architects, in submitting this Bill to the Legislative Assembly of Ontario, are only doing the work that the public should perform for itself. In nearly every case where a building has been found to be defective in any particular, the press has laid the blame on the profession as a body. If every case of failure were investigated, it would be found that the mistakes were owing to the engagement of an ignoraut man, who had no right by training or natural ability to assume the duties of an architect, as well as to the fact that the public is unable to distinguish between the competent and incompetent. It certainly is not fair to blame a profession as a body for the errors of individuals who have no standing with the profession. These men claim to be of the profession, the public accepts their statements, employs them, finds them incompetent, and forthwith condemns the profession as a body as if there were no competent men in it, but that all were like those men whose statements they are so ready to accept. The Bill of Registration, if passed, will remedy this state of affairs, unsatisfactory alike to the profession and the public. The man who employs a registered architect will have some guarantee that he has a reasonable knowledge of his business, that is, after the Bill has been in force a few years—for as all men now professing to be architects will be entitled to be registered, it will require time for those among them who are incompetent to pass out of sight. If the profession asked the Legislature to pass an Act which would make it unlawful for any but a registered architect to practice architecture, and which would not allow anyone to erect a building except he employed a registered architect, there would be more than ample grounds for the throwing out of the Bill. The profession cannot gain anything from the passing of the Bill except in an indirect way. The men who are now practicing will in the course of a few years have to contend with young men who will have had the advantage of a thorough and systematic training. Our best men will feel the competition of these young men, and the inferior men must suffer materially. Yet in spite of such facts, nearly all the architects now practicing in this province are united in asking for the passing of this Act.

Some may imagine that this movement for the incorporation of the profession of architecture is local and recent in its character. Such is not the case. The question has been more or less before the profession for the last twenty-five years, since the Royal Institute of British Architects made a movement toward that end a quarter of a century ago. During the last three or four years the movement in Great Britain has assumed a definite form, and a Bill was submitted to the House of Commons in 1888, which, however, was withdrawn at that time, owing to the opposition of the Royal Institute of British Architects and the Civil Engineers, but submitted again in 1889 in a revised form. There is no doubt but that it will eventually pass. In some of the Australian colonies the matter has been taken in hand, and a Bill to incorporate the architects of these colonies is now under discussion. In the United States, Bills have already been submitted to some of the State Legislatures, and advanced several stages; and in many of the other States Bills are under preparation for submission to the Legislature. It will thus be seen that this movement is not a new or sudden one. It is rather an old one which has slowly gathered force until Acts of incorporation are now being asked for in all quarters of the world for the proper and equitable acknowledgement of the profession of architecture, in order that the public may be protected from loss of life and money through the ignorance of many supposed qualified practitioners. The membershlp of the Ontario Association of Architects includes 92 per cent. of all men now practicing architecture in this province, and when those who have applied for admittance to the Association are received, the percentage will be 97. The movement has received the full and hearty support of the medical profession in Great Britain. Medical men are brought into contact with the ill effects of bad building, drainage, etc., and knowing the results, are only too anxious to aid in securing such legislation as will remedy an evil which has caused many deaths, much sickness, and heavy pecuniary losses.—*The Canadian Architect and Builder.*

THE GIRALDA IN THE SPANISH CITY OF SEVILLE.

THE GIRALDI.

This famous belfry tower was built in 1196, as a minaret of a Mohammedan mosque. It displays the architectural characteristics of the Moorish people at the time they occupied the southern provinces of Spain. It now forms a portion of the Catholic cathedral. The tower is fifty feet square at its base, and is three hundred and fifty feet high.

There are records that on the present site there was once a heathen temple, erected by the Carthagenians, which the Romans afterwards appropriated to their own worship, and in turn were dispossessed by the Moors.

It is a curious reflection, that in the course of time and the unforeseen changes it brings, the present occupants may, perhaps, be forced in their turn to vacate in favor of still other beliefs.

VIBRATION IN BUILDINGS.

One of the most perplexing problems that confronts the engineer, is the vibration in buildings caused by running machinery Westinghouse, Church, Kerr & Co. of New York, being frequently called on to locate Westinghouse engines on the upper floors of buildings, have had a wide experience in this line, and have given the subject much thought. In determining these questions, they say the character of the building, the ground on which it rests, the weight, power and speed of engines, are all factors which must be considered, some of which are very indefinite, or at least their effect is hard to predetermine, combined with which is the very important influence, namely, the relation which the speed of the engine bears to the natural time of vibration of the floor beams. It is evident that if the slight motion which every engine has is exactly in time with the natural vibration of the floor beam, each pulsation of the engine will increase the scope of the vibration of the floor, resulting in a most disastrous shaking, while if the pulsations of the engine are in discord with the floor, comparative quiet will exist. As floor beams are usually long, and their time of vibration correspondingly long, it is usually found that a fast running engine will give less of its vibration to the floor beams than a slow running one. It is also worthy of note that the vibrations of a fast running engine are more numerous and less forcible, hence easier resisted by the mass of the floor.

An interesting example of preventing vibration by discord was shown in the case of a Westinghouse 10 H. P. engine which, on an upper story of a silverware manufactory created such a commotion as to rattle the silverware on the shelves 100 feet distant. A change of 25 revolutions in the speed, which change was in the direction of increasing the speed, entirely stopped the vibrations. A most interesting work of this nature, also, is in the great coffee house of Arbuckle Bros. in Brooklyn, where two Westinghouse engines of 125 H. P. each and one of 45 H. P. are located on the fifth floor. These engines were erected on the heavy floor timbers, the floor boards being cut away and extra timbers being inserted between the joints. Across the timbers were placed oak stringers, which latter have been seasoning since the war in some unfinished vessels in the Brooklyn Navy Yard. On these the engines were mounted with plain fly wheels, and experiments were conducted to determine the speed at which it would be best to run. It was found that at 204 revolutions the vibration was at the minimum and was very slight, being as little as that caused by any of the ordinary driven machinery. The speed was therefore fixed at this point, and the wheels then made to give the proper belt speed.

The erection of engines as large as this on upper floors is somewhat novel, and should only be undertaken with full consideration of the surrounding conditions and with engines which are completely balanced.

Most of the old houses on both sides of the Tiber, at Rome, have been removed, fine embarkments of masonry have been erected, slightly deepening and widening the river to an average width of sixty-five yards, and on top of the embankments, on both sides, esplanades are formed as on the Thames embankment at London. One of the new bridges crossing the stream is thirteen yards wide, and near it at either end, stand new buildings seven stories high, completely shutting out the views of the Janiculum and San Pietro hills.

The Romans well understood the necessity of protecting from dust the materials with which they made their mortar; its importance is not sufficiently realized by the builders of to-day, as workmen may often be seen mixing mortar and concrete from materials that have been emptied in piles on a dusty street. More care should be taken by those who desire to get the best results at the least expense.

Washington, Feb. 24.—Secretary Windom has awarded to the Hall Safe and Lock Company of Cincinnati a contract for constructing steel-lined vaults, including two doors, in the Mint building at San Francisco, at their bid of $23,936.

The successful design in the competition for the Prudential Insurance Building at Newark, N. J., was submitted by Mr. George B. Post, architect, of New York. There were five invited competitors.

THE MACHINERY HALL, PARIS EXHIBITION.

Of the splendid series of buildings which formed the great Exhibition of last year, the Machinery Hall was undoubtedly the most magnificent in conception and scale. The architect and engineer specially charged with the design of this immense structure, were M. Dutert and M. Contamin respectively, and the confidence placed in their ability was fully justified by the universal admiration accorded to their great work.

The hall is 1,381 ft. long and 490 ft. wide, inside dimensions, and is divided into one great central nave 375 ft. wide in the clear, and 151 ft. 6 in. high to the ridge of its roof, with an aisle each side 57 ft. 6 in. wide, having a gallery floor over of the same width at 26 ft. 3 in. above the ground level. There are nineteen bays in the length of the hall, viz:—1 bay at each end of 83 ft. 1 in., 1 center bay of 86 ft. 8 in., and 16 intermediate bays of 70 ft. 6½ in.

The side galleries are covered by a series of roofs, one to each bay, which have their ridges at right angles to the axis of the building, and stop against the vertical sides of the center nave just below its eaves, showing a series of low-pitched and slightly curved gables on the lateral facades of the hall. The construction of these side galleries and their roofs, though exceedingly well designed, offers nothing of exceptional interest for our consideration.

It is otherwise with the roof over the great central nave, and a brief description of its principal constructive features, together with a summary of the mechanical principles on which its stability and strength depend, may be of interest as a record, however insufficient, of this remarkable work.

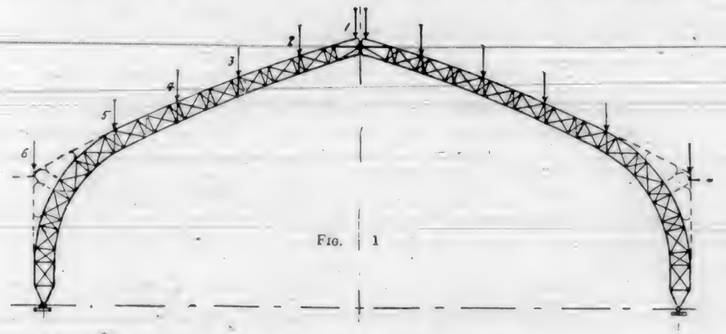

FIG. 1

The roof is carried by eighteen arched principals, at the distances apart above given, and two end principals of exactly similar appearance, but altered scantlings, which are the upper members of the glazed screens forming the end facades of the hall. The arched principals carry on each side the center line five ranges of longitudinal girders or main purlins placed vertically; those nearest the center on each side are only 3 ft. 10 in. apart, and carry a ridge gangway; the other ranges are spaced at a uniform distance apart of 35 ft. 2 in.

Three ranges of intermediate rafters are carried by the main purlins in each bay, following the lightly curved outline of the roof, and these rafters carry thirty ranges of secondary purlins on each side the center line, running continuously over intermediate rafters and main principals, the secondary purlins in their turn carrying the sash bars and light wood framing for the glass and zinc roofing. Each end bay is braced against wind pressure by a system of diagonal tie-rods, extending from the ridge to the gutter on each side.

The four longitudinal bays on each side the ridge between the outer main purlins are glazed in the center seventeen bays of the roof, the lower part on each side in those bays and the whole of each end bay being covered with zinc on boarding and having an inner boarded ceiling.

The sash bars are 2″ by 2″ by $\frac{3}{16}$″ ⊥ iron 6 ft. 6 in. long, resting at each end on the secondary purlins, and fixed to them by cold riveting. They are spaced 1′ 8½″ centers for 20″ glass, and overlap at the lower ends 7 in. The secondary purlins are formed of channel iron 5⅝ in. by 1¾ in., with a 2½ in. by 1¾ in. by $\frac{1}{8}$ in. ⊥ iron riveted on the back to take upper ends of sash bars, the lower ends of same resting on the top of the channel iron. The intermediate rafters are of riveted I section, web 15¾ in. deep by ¼ in., and four ⊥ irons 2.8 in. by 2.8 in. by 0.28 in. They are not continuous, but fit in between the top flanges of the main purlins, and fix to curved plate and angle iron gussets attached to the vertical web members of the latter.

The main purlins connecting the principals are lattice girders with N bracing, and are 6 ft. deep in the middle, becoming slightly deeper towards the ends; the top boom is level, and the lower boom falls from each side center of span, meeting the arched principal at each end with a bold curve. The booms are each formed of a vertical web 14 in. deep by 0.28 in., two angle-irons 2.8 in. by 2.8 in. by 0.28 in., and one flange plate 12 in. by 0.28 in. The lattice bracing consists of diagonal flat bar ties and vertical struts of double T iron. These girders are not radial to the roof line, but are vertical, this being the best arrangement for purlin girders of long span.

Each arched principal consists of two great curved rafters, pivoted at the springings and summit, forming a "three-hinged arch": (see fig. 1). This arrangement allows free movement under temperature changes without strain to the structure, the center rising or falling freely with a slight rotation of the semi-arches about the pivots. A range of temperature of 100° Fahr. corresponds to a difference in level of 2⅞ in. at the center pivot, and a horizontal movement of $\frac{3}{16}$ in. on each side at the level of the side gallery roof ridges, which last amount is small enough to be taken up by the elasticity of the gallery structure. The calculations of the stresses occurring in the principals are also much simplified by the triple articulation, since the forces acting upon each part are definite in direction and point of application. The main dimensions of the arched principals are as follows:—

Spans between centers of pivots at springings 363 ft.; rise to center of pivot at summit 147 ft.; depth of arched rib at springing 12 ft. 1½ in., diminishing to 9 ft. 10 in. at the summit, where the two semi-arches abut against the center pivot. The springing pivots are turned steel pins 20¾ in. diameter, and 4 ft. 4 in. long, enclosed by cast-iron bedplates, having almost complete semi-cylindrical journals, the upper bedplate being bolted to the foot of the rib, and the lower one to a foundation plate which is secured to the foundation block by long bolts. The pivot at the summit is a turned steel pin, 14 in. diameter, and 2 ft. 4 in. long, similarly enclosed by cast-iron journals, each forming an almost complete semicircle, but with a slight space between their faces at top and bottom on the vertical center line to allow of the very small rotation accompanying vertical movement of the summit.

The section of the arched rib is that of a girder with trough booms facing each other, "see figure 2" and connected by St. Andrew's Cross web bracing with radiating struts, which divide the rib into alternately long and short panels. This peculiar panel division was devised to suit the spacing of the main purlin girders, each of which fixes to one of the diagonal bars crossing a short panel, actually vertical. Each boom consists of two side plates 17¾ in. deep by 0.35 in., placed 16 in. apart, a continuous flange-plate 30 in. wide by 0.28 in.; and four angle-irons connecting these plates 4 in. by 4 in. by 0.4 in. The single flange-plate, 0.28 in. thick, extends from end to end of each boom, but they are largely increased in

FIG. 2

strength towards the haunches by a number of additional plates of varying length, which are stopped off in order towards the springing and summit. The flange-plates at the greatest section of the lower boom or intrados, occuring opposite the center of outer spandrel, are 1 inner plate of 0.28 in., 4 inner plates of 0.32 in., and 1 outer plate of 0.4 in. It is the same for the up- [illegible] except that the outer flange-plate is re- [illegible]

A large part of our extensive river front, bridges, and viaducts, as well as many of our streets, are now lighted with electricity generated by the city at its own plant. The wires, lamps, and entire paraphernalia are owned by the city, free from any sort of control by private corporations. The system is being rapidly extended so as to embrace the whole city. It is the intention ultimately to make connection with stores, factories, and residences, so as to supply light for private consumption.

In our last issue we published several articles and portions of articles, taken from our exchanges, and by oversight neglected to give the proper credit to which they were entitled. We will consider it a favor if each subscriber will make the necessary corrections in the March number under the uncredited articles as follows:—

The article under the heading of "The Machinery Hall, Paris Exhibition," was an extract from a paper contributed to the *Journal of Proceedings of The Royal Institute of British Architects*, by Henry Reilly, Assoc. M. Inst. C. E. For "St. Louis City Hall Competition" we are indebted to the *Building Trades Journal*, of that city.

THE MACHINERY HALL, PARIS EXHIBITION.

Of the splendid series of buildings which formed the great Exhibition of last year, the Machinery Hall was undoubtedly the most magnificent in conception and scale. The architect and engineer specially charged with the design of this immense structure, were M. Dutert and M. Contamin, [illegible]

of the channel iron. The intermediate rafters are of riveted I section, web 15¾ in. deep by ¼ in., and four L irons 2.8 in. by 2.8 in. by 0.28 in. They are not continuous, but fit in between the top flanges of the main purlins, and fix to curved plate and angle iron gussets attached to the vertical web members of the latter.

CITY BU

strength towards the haunches by a number of additional plates of varying length, which are stopped off in order towards the springing and summit. The flange-plates at the greatest section of the lower boom or intrados, occuring opposite the center of outer spandrel, are 1 inner plate of 0.28 in., 4 inner plates of 0.32 in., and 1 outer plate of 0.4 in. It is the same for the upper boom or extrados, except that the outer flange-plate is replaced by two angle-irons 4.4 in. by 4.4 in. by 0.44 in., which connect the spandrel webs to the principal.

The radiating struts fit in between the side plates of the boom, and between the outer purlins marked (5) on the figure [fig. 1], consists of a web 15.2 in. by 0.28 in., and 4 angle-irons 3.2 in. by 2.4 in. by 0.28 in. The diagonals are attached to the inner and outer faces alternately of the boom side-plates. Between purlins (5) they consist of four angle-irons only 3.2 by 2.4 in. by 0.28 in. Beyond purlins (5), the angle-irons in struts and diagonals become 2.8 in. by 2.8 by 0.28 in., and flange-plates are added 7.87 in. by 0.28 in.

The lower end of each semi-arch is made of almost triangular form, being narrowed down from 12 ft. at the foot of the lowest bay to 4 ft. at the cast-iron bearing-plate resting on the springing pivot, while the flanges are at the same time widened out to 4 ft.; it has two solid webs with thickening plates, which are reinforced by a diaphragm and gusset plates, with inside and outside angle-irons. The upper ends of the semi-arches are provided with two diagonal struts, formed of plates and angle-irons, which converge to the center pivot and take up the resultant thrust passing through it; these ends have a curved shape between the inner and outer booms, and are stiffened by webs, to which are fixed the ends of the center pair of main purlins, forming here the ridge girders. These girders are connected together opposite to each intermediate rafter by gussets of plate and angle-iron, between which a plate of lead, ⅝ in. thick, is placed, and which yields sufficiently to allow the slight motion due to temperature changes.

The straight sides of the angle spandrel are of the same trough shape as the main booms before described, and of the same scantlings, with the single outside plate 30 in. by 0.28 in. The side-plates are cut so as to form openings of bold curved outline, and between them are fixed radiating members which carry on the lines of the radial struts in the principal, and are of similar construction.

In the plane of the vertical back of spandrel, which is that of the outer enclosure to the center nave, the arched principals are connected together by a series of latticed arches, semicircular on the soffit except in the center bay, and of which the extrados repeats the slightly pointed and curved outline of the side gallery roofs. Uprights in the spandrels of these arches support a continuous purlin girder, which carry the outer ends of all the intermediate rafters of the main roof and also its outside gutters. The principals are further connected by a range of lattice girders carrying the floor and forming the front of the side galleries.

The material employed in the main roof was almost entirely steel, specified to have a breaking tensile strength of 28 tons per sq. in., and a tensile limit of elasticity of 15¼ tons per sq. in.; also that at fracture a reduction of sectional area not less than 45 per cent. should take place, with an extension of at least 24 per cent.

Each ordinary main principal rafter weighed 196 tons, and each end principal rafter 240 tons, the ten main purlins in each bay weighed 42 tons, and the intermediate rafters, minor purlins, and sash-bars had per bay the total weight of 62 tons. The weight of material in the center roof framing per square foot of area covered was 22½ lbs.

MUNICIPAL OWNERSHIP OF ELECTRIC LIGHTS.

Chicago is now engaged in establishing a Municipal Electric Light System. It is an undertaking directly in line with Nationalism. The work has progressed far enough to demonstrate itself a "sure thing," both as to saving money for the people and as a blessing to humanity. It therefore finds hearty endorsement, save only by our Gas Trust and private Electric Light corporations.

A large part of our extensive river front, bridges, and viaducts, as well as many of our streets, are now lighted with electricity generated by the city at its own plant. The wires, lamps, and entire paraphernalia are owned by the city, free from any sort of control by private corporations. The system is being rapidly extended so as to embrace the whole city. It is the intention ultimately to make connection with stores, factories, and residences, so as to supply light for private consumption.

How did we succeed in getting such a work established without being headed off by private monopoly? Through a beginning so small as not to attract special notice! To our faithful servant, Mr. John P. Barrett, City Electrician, are we chiefly indebted for our good fortune. Some two and a half years ago, as Superintendent of City Telegraph Department, Mr. Barrett asked the City Council for a small appropriation with which to experiment in lighting the river front by electricity. About twelve thousand dollars was granted him. With this he purchased a small outfit, and commenced operations in an abandoned Fire Engine House belonging to the city. He laid his wires in the ground, from the first, and started a few lamps on the river front and at certain bridges. The effect was *truly* electric. The dark narrow river, dangerous alike to passing vessels and such people as were belated along its wharves, became like day, and safety was vouchsafed to all within the rays of these lamps. This small venture gave wonderful satisfaction, and the next year, a larger appropriation was voted with which to extend it, and try the lighting of a few streets. Mr. Barrett made the most of his opportunity, and the city's electric lamps soon became noticable on prominent corners.

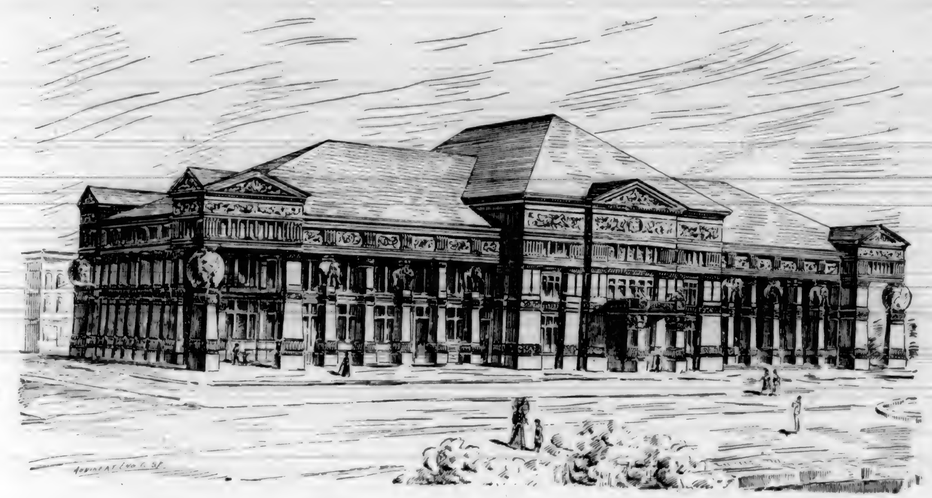
As these increased in number, the councilmen from wards not thus lighted, began importuning Mr. B. for an extension of the service to their wards. They would say to him, "My constituency are observing your electric lights down town, and, as tax-payers, want to know why they can't have the same thing out their way; what's the reason you can't run your wires out to our ward and give *us* the benefit too? To which it gave Mr. B. great pleasure to reply, "that is exactly what I propose to do, just as fast as you gentlemen will vote me the money to do it with." With the "Constituency" thus aroused and making demands, there was little disposition to refuse Mr. Barrett's request for a larger appropriation; in fact a vote against it would be political suicide.

During 1889, there was appropriated for this service, two hundred and seventy thousand dollars ($270,000.) A large part of this sum is being expended in the building of three very substantial plants in as many divisions of the city. These will be completed and running by March 1st, next. In addition, a system of trunk lines is being rapidly extended throughout these districts, the wires being laid under ground. At present the city is operating 310 lamps. By March next 500 more will be added. March 1891 will see another 1000 added, making about 1800 in all. By March 1892, there will be in operation 2500, sufficient to light every street which is now lighted by gas. Chicago will be able to present to its visitors from all over the world in 1892, a sight to be found no where else,—a great city entirely lighted by electricity, the service performed by itself.

The present cost per lamp per night, according to the city electrician's last report, is about nineteen (19) cents. With the new plants in operation, the cost will be reduced to about (50) fifty dollars per lamp per year. St. Louis considers herself fortunate in contracting with a private corporation to supply city electric lighting at $80 per lamp per year, an advance of sixty per cent. over Chicago's cost.

We now pay our Gas Trust the modest sum of six hundred thousand dollars ($600,000) per year for lighting our streets. Our 25,000 electric lamps at $50 each will do it for $125,000,—and, as Mr. Barrett says,—give us forty times the light. The same authority says that the private consumers of the city electricty will pay less than for monopoly gas, and the city still have a profit on the business. In fact, he expects that after a time, the city profit on private consumption, will pay the expense of city lighting, and thus the city save the whole $600,000 per year now paid the gas trust.

Thus is Chicago publishing to the world, in the universal language of dollars and cents, *how much* better and cheaper the people can perform their own service, than they can get it done by farming it out.—*The Nationalist.*



COLORADO MINERAL PALACE.—O. BULOW, ARCHITECT.

We present above the design for a mineral palace to be erected at Puebla, Colorado; the cut is made from the drawings of the architect, Mr. O. Bulow, whose project was chosen from among a number submitted in competition.

The description of the building is as follows, and embodies some very unique and pleasing ideas. The plan is a parallelogram, 333 feet long by 164 feet wide. The main entrance admits the visitor to the central chamber, circular in form, 100 feet in diameter and 70 feet to the apex of the dome which surmounts it, and which is flanked by two smaller apartments, each 75 feet in diameter, of similar finish and design.

It is intended to make the building a permanent exhibit of the various minerals, ores and building stones of Colorado and elsewhere, by so using them that they form a part of the construction itself, instead of being displayed in the usual manner. The various quarries will be each represented by one or more columns or pilasters of the particular variety of marble, granite or sandstone they produce, and the effect secured by the contrasting colors can be rendered very striking, if the designer exercises good judgment in massing his colors—though of course such conglomeration would be inadmissable under ordinary circumstances.

Different mines will contribute specimens of their ores with which to adorn the walls, arches and ceilings, which will contrast handsomely with sparkling galena quartz and pyrite, mica, agate and feldspar. In the center of the middle dome will be a prismatic fountain, modeled after that of the Paris Exhibition. The roof will be covered with burnished copper.

The style of architecture employed is Egyptian, with some details modified to meet particular requirements.

COURT DECISIONS.

Judge Van Reynegom has reversed the judgment of the Justice's Court in a suit brought by the Fire Wardens against Samuel Hancock, for violating that section of the Fire Laws requiring light shafts in all buildings to be lathed with iron lahts previous to being plastered. Hancock was convicted, and fined fifty dollars for having failed to cover the framing in the light shafts at 414 Ellis street, in conformity with the iron laths called for. In the appeal, Judge Van Reynegom, in summing up, said there was no proof that a light shaft or well, according to the meaning of the term, was on the premises; that the ordinance fails to define what constitutes a light shaft, but he presumed it must mean a well-like structure, extending from a skylight to its base, for the purpose of giving light; that as the premises in question had no enclosed shaft, but merely a hand railing running around the hole, and as architects had testified that there was no light shaft in the building, for these reasons he reversed the judgment of the lower court.

While admitting the power of the Board of Supervisors to pass such an ordinance, the Judge declared it had not legally exercised its powers in the present instance.

The management of this journal desires to extend a cordial invitation to all Architects on this Coast and elsewhereto contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth, white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

Our lithographs this month show a residence designed by Architect Young of Los Angeles, and the Lick Free Baths by Messrs. Wright and Sanders of this city. The other designs are described in the text.

ST. LOUIS CITY HALL COMPETITION.

The competition for furnishing plans for the new City Hall for St. Louis has at last been decided. The Board of Commissioners held a meeting, at which it was agreed that the three plans marked "Unity," "Pro Patria" and "St. Louis," were especialiy worthy of notice. These designs were put into the hands of Architect James McGrath, of this city, with instructions to report upon the comparative cost of each at the present ruling prices of material and labor. Mr. McGrath reports that this duty has been especially arduous, as the plans were not accompanied with sufficient data on which to make a ready estimate, although the code particularly provided for detailed specifications on which to found a basis of estimate. For this reason the work was delayed.

The City Hall Commissioners met on the 14th inst., in the Mayor's office, Mayor Noonan presiding. All the members were present, and Mr. McGrath was on hand to give an opinion as to the cost of constructing the buildings provided for in the several sets of plans considered the best. Mr. McGrath did not make a formal report, but gave his reasons as to why the set termed "St. Louis, 1892," should be selected. Such a building as would be erected in the event of the adoption of the plans, it was argued, would not exceed the appropriation in point of cost, and would be acceptable in every particular for a model City Hall. The matter was further discussed and the commission then, by a unanimous vote, adopted these plans. It was not known when this action was taken who submitted the plans. When it was adopted, the envelope containing the name of the architect was opened, and it was then ascertained that Eckel & Mann, of St. Joseph, Mo., were the lucky competitors for the first prize, which is $5,000, with privilege of superintending construction.

The five consolation prizes of $1,000 each were then awarded as follows: "Pro Patria," by Sidel, Ginssort & Ginder, of Birmingham, Ala.; "Faith," Carreve & Hastings, New York; "Civic," E. T. Fassett and A. J. Russell, Kansas City; "Star and Crescent," W. H. Dennis, Minneapolis, Minn.; "Unity," James & James, New York.

The high standing of the expert selected is a guarantee that his decision was impartial and his estimates approximately correct. He was prominently mentioned, four years since, in connection with the office of Supervising Architect of the Treasury, and is well known throughout the country.

Mr. McGrath states that the work represented by the 37 plans is worth in the neighborhood of $40,000, and yet the competition has been one of the fairest conducted of late years in this country.

DESCRIPTION OF PREMIUM DESIGNS.

St. Louis, 1892.

This plan received the $5,000 prize. The design is in the Norman-French style of the Fourteenth century and is very handsome and elaborate. Ample provision is made for lighting all the departments. The halls of legislation and the Treasurer's office are given positions of architectural importance, but the latter is unduly prominent externally, while the former are externally diminished in importance by the bays that flank them. The exterior is consequently less expressive than in some of the other designs. It lacks repose and simplicity, being greatly injured by the two bays just mentioned. The main entrance is hardly adequate, but the main hall, the double staircase and the elevators are very happily combined. The stairs, main corridors and offices vary in this respect from admirable to poor. The material will consist of Missouri granite, rock face and St. Louis pressed brick. The dormers and cornices to be composed of terra cotta with finials and crestings of copper. Roof to be covered with copper and slate. The building to be thoroughly fireproof. The floors of the main halls, public spaces and rooms and the wainscoting to be of marble of various hues. The stair cases to be also of marble and stone. The estimated cost of this building is $1,100,000. The architects, Eckel & Mann, of St. Joseph, have been notified to come to St. Louis to confer with the board regarding necessary changes.

PRO PATRIA.

This design was drawn by Sidel, Ginssort & Ginder, of Birmingham, Ala. It was rated by Prof. Ware as the best of the thirty-seven submitted. It is certainly a beautiful design in the Gothic style, but its great comparative cost rendered it unavailable. Mr. McGrath thought that it could not be built for less than $2,000,000.

UNITY.

The claim for this building made by its architect is that it is useful and within the limits of cost. The architectural plan is the peculiar American development of the Romanesque. The details of the design are calculated to withstand the action of dirt and soot. The plan assumes the form of a parallelogram with a large court in the center, lighting the halls, corridors and staircases. There are four principal entrances, those on the east and west wings being covered. A grand staircase leads primarily to the Council and House of Delegates. The cost was estimated by the expert at $2,000,000.

STAR AND CRESCENT.

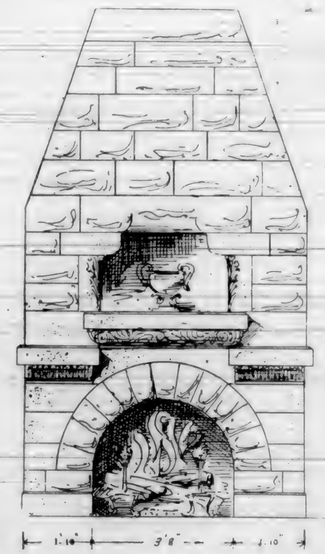
By W. H. Dennis, of Minneapolis. Classic in design, with very ample provisions for light and entrance. This would have made a very imposing building, surmounted with corner and central towers. The specifications provided for the use of saw-dust instead of sand in the plastering.

CIVIC.

By E. T. Fassett and A. J. Russell, of Kansas City. Very handsome, and apparently in full accord with code of competition. Very convenient arrangement of legislative and business departments.

FAITH.

By Carreve & Hastings, New York. Deserving of special mention. Style, French Romanesque, with a few early Gothic features. Thoroughly fire-proof. Ample light and air. Whole building in exact conformity with instructions.



MANTLE IN STONE, FOR THE SUTTER CLUB.
CURLETT AND CUTHBERTSON,
ARCHITECTS.

Most of the architects of Great Britain have signed an agreement not to compete for any building if their designs are to be submitted to anyone for decision who is not an architect known to the profession.

IN THE "VERNACULAR."

The question is often propounded by the inquiring American, Why it is that America is without a distinct American style? Many remarkable attempts have been made to answer this inquiry. Some have even gone so far as to call the attention of explorers and other scientifically inclined minds to the wonderful structures reared by the mound-builders; others have risked life or limb in vain attempts to fathom the mysteries of the cave-dwellers in the wild cañons of Colorado. Others, again, have not hesitated to declare that the Incas have left monumental remains of a long lost art that any nation might be proud of. In fact, archæology itself has been appealed to and invoked to restore to us evidences of a great bygone American architecture, but in vain. The restless American eye has turned itself inward at last, and revealed an astonishing discovery—a style so rich in its decorative emblazonry as to astonish even the learned beholder, displaying to the thoughtful student such a wealth of encrusted enrichments as no Etruscan artificer ever dreamed of. The manifestations of this style are so peculiar and so striking that to understand the meaning of their story needs an erudition that is profundity itself. To see this style developed in its pristine beauty and unrivaled freshness, it is necessary to take a train to any far inland town, particularly if it be near a planing mill. The first glimpse one gets of a dwelling in this style is, of course, the general outline. What this is it would be indeed difficult to say. The sky-line is such a zig-zag contour, with pro-Norman feeling here, unmistakable Queen-Anneism there, Cinquecento yonder, Neo-Grec farther on, that where to begin and where to end is puzzling; but finally the eye itself, after wandering about the maze of sub-roofs, dormers, peaks, turrets, spires, campaniles, light-house bell-towers, smokers' snuggeries, and other quaint modern devices, lights upon the entrance-porch, or verandah, or piazza, or porto-cochere, or Dutch stoop, or reminiscence of Cluny, and is delighted to find—just as expected—that this porch, or stoop, or what-not, is tacked on to the building like a dog-kennel or chicken coop. This feature is noted and commented upon with peculiar satisfaction, for it is one of the unmistakable evolutions of modern architectural progress, and by the one-and-a-half-per-cent. men is styled a "cute" innovation.

What the most marked characteristics of this style are, not to make a long story too short, it would be equally difficult to say, "but there is one thing I hav' notiss," as Mr. Cable's famous creole Narcisse says, and that is the jumble of roofs just cited, the unaccountable corners, angles and elbows of the elevations, the "quaint" (?) breaks in the cornice, the snow traps on all parts of the house and the elaborate schemes of ornamentation offered.

The porch posts, for example, are arranged into compound columns of the most striking orders; one column consists of drum upon drum without base, plinth or capital, the more shown the richer the order. The entablature itself exhibits in a striking degree the triumphs of the modern jig-saw, and the cornice itself is modillioned and encrusted with mouldings to such an extent that one finds it difficult even to count them.

Some one has said that it is to the window we must look for evidence of a new style. Whenever the form of the window, its arrangement or its grouping, has been crystallized into permanent usage, then the world has become enriched by a new style. Applying this dicta to the scene of our investigations, we discover this; in the new style it is the custom to have but one window to a room, and that must be broad and low, and have its upper sash filled with encrusted glass—encrustations still wherever one may look for them—so, we suppose, that the inhabitants thereof cannot see thereout. Some mean and envious and unsuccessful architect has bitterly called this style the "barnacle style," and this outrageous person has gone so far as to divide this style into two groups, one in which the buildings arrange themselves on account of their size, being too great for their purpose, and the other on account of their dimensions being too small for the people who occupy them. But this arrangement and arraignment may, we assure our readers, be passed by with contempt and disdain. The style we have only briefly glanced at is very different from this. We are not responsible for its name; we do not know who is; but the name has passed into history—it fits the architecture as a glove does the hand, and it is needless to say the style of house we refer to is built in the popular "Vernacular."—*Architecture and Building.*

PAINT AND VARNISH BLISTERING AND ITS PREVENTION.

The question of blistered paint or varnish is a very vexed one. It has caused much anxiety and perplexity, and any amount of hard and unjust abuse, simply because it is invariably attributed to the use of inferior materials or "bad paint," as the phrase goes. Those, however, who have had long practical experience, and who have thought the matter well out, will not have the slightest hesitation in saying that it is nothing of the kind, an expression I may, perhaps, before I finish, be able to justify.

I was called in only the other day to examine and pass judgment upon the external painting of a bank, near Manchester. The work was done by a very respectable firm some time ago, and portions of it were fouud to be very much blistered, the lower part of the entrance or vestibule door (which was partly shaded by a lead covered roof) in particular; and to such an extent was this the case that for about eighteen inches from the floor it was a mass of blisters, and from that point upward a beautiful piece of work, as level and smooth as a polished plate. Bad paint or varnish, I think, could not be the cause of this; if so, why was it not blistered all over? How, then, was it to be accounted for? Simply this; the sun's rays striking the door at an angle of about forty-five degrees caused the mischief. This was explained to the manager, and he expressed himself perfectly satisfied on that point; but at the same time made the remark that there were no blisters on the same door when done three years ago. Quite likely, but from experience I find that the more paint or varnish the more blistering, hence the necessity of removing the old paint or varnish before applying the new. The more scientific question may arise, "Why does the action of a moderate degree of heat on the surface of paint or varnish cause blistering?" Because almost every kind of wood, more particularly white and yellow pine, being soft, contain, to a more or less extent, air and moisture, and, as a rule, immediately on leaving the joiner's hands, is painted with a coat of oil priming. Then begins the mischief; coat upon coat of paint follows in rapid succession, until this waterproofing and air-tight process is completed. Kept in the shade, the work is everything that could be desired, and nobody grumbles. No sooner, however, is it exposed to the rays of the sun, than the surface becomes heated (the more so if the paint is dark in color), the air and moisture underneath are expanded, steam generated, and in its effort to escape raises or upheaves the air and water-tight coatings in the form of blisters. Invariably the reputation of the painter is damaged in proportion to the exposure of his work to the destructive power of the sun, an agency over which he has not the slightest control.

Now in the case of iron or other metallic substances being painted, I have stated that soft woods under paint or varnish are more liable to blister than the hard or close-grained qualities, which partake more of the nature of iron and other metallic substances, and which, irrespective of quantity and quality of paint or varnish, or however much exposed to the sun, are seldom if ever found to be blistered. Why? Because the non-absorbent nature of the metals precludes the possibility of air or moisture entering into their composition, hence the absence of blisters as compared with the softer kinds of timber. Then, again, we have internal blistered paint, which in some instances differs in appearance from that already described, being more like heavily embossed leather. It is often deeply furrowed into patches, resemblng in appearance the skin of a crocodile, and in many cases it is drawn into lumps as large and not unlike the form of split peas. This kind of damaged work is from the same cause, and results from long-continued exposure to the sun's rays, which, when reflected or focussed through glass, are much more powerful and destructive in their action on paint on that account. This kind of damaged work is chiefly to be found on the fronts of shutters exposed to the sun in the hottest part of the day, but never on the soffits or other interal or external portions of the painted or varnished wood work, entirely shaded or otherwise protected from the sun.

There is yet, however, another kind of blistering which may be occasionally met with, and in places, too, upon which the sun may never shine. This we find to be the case on newly-plastered walls having been oil-painted too soon, and also in places where old plastered or painted walls have been saturated with water through the bursting of pipes and other accidental causes. Nevertheless, the same influences have been at work, though more unequally combined, or, in other words, less heat on the one side and more water on the other, with the hermetic film of dried paint or varnish between.

It will, I think, be seen from my line of argument, anent the question of blistering, that practical prevention in the case of oil paint or varnish is almost impossible, and could only be accomplished—first, by the use of white paint only, the destructive power of the sun upon dark surfaces having little or no effect upon white; second, by extracting the air and moisture effectually from the finished wood work in a heated chamber, and, on the instant, coated over with linseed oil priming; third, by complete protection from the sun; fourth, by stopping the sun from shining, which, I think all will agree, would be the greatest impossibility of all.—JAMES RENWICK, in *The National Builder.*

WASHINGTON'S BIRTH-DAY.

Architecture and Building, commenting on the anniversary of Washington's birthday, says:

The grave of Washington's mother is without a monument, and the money for the Washington Memorial Arch comes in but slowly, although the design has been accepted with universal approval. One magnificent edifice we may consider a memorial of the great statesman—the Capitol at Washington—the site of which was selected by President Washington in 1791. A plan was prepared by Dr. William Thornton, of Pennsylvania, and, after material changes, it was approved by Washington and submitted to Stephen Hallet, a French architect, to whom was entrusted its execution. On September 18, 1793, the corner-stone of the edifice (southeast corner) was laid by Brother George Washington, assisted by the Worshipful Masters and Free Masons of the surrounding cities, and the military and a large number of people. The silver plate deposited in the cavity of the stone bore the following inscription: "This south-east corner-stone of the Capitol of the United States of America, in the City of Washington, was laid on the 18th day of September, 1793, in the thirteenth year of American Independence, in the first year of the second term of the Presidency of George Washington, whose virtues in the civil administration of his country have been as conspicuous and beneficial as his military valor and prudence have been useful in establishing her liberties, and in the year of Masonry 5793, by the President of the United States, in concert with the Grand Lodge of Maryland, several lodges under its jurisdiction, and Lodge No. 22, from Alexandria, Virginia. Thomas Johnson, David Stewart and Daniel Carroll, Commissioners; Joseph Clarke, R. W. G. M. P. T.; James Hoban and Stephen Hallet, Architects; Collin Williamson, M. Mason." It may be interesting to note here the other architects employed on the erection of the Capitol: In 1803 R. H. Latrobe was appointed architect; in 1818 Charles Bulfinch had charge of the work, and in 1851 Thomas U. Walter's plans for the extension were accepted. It is stated that the cost of the Capitol has been less than that of the Court House in our City Hall Park! being estimated at $13,000,000.

NOTES & COMMENTS.

The new company that is to supply East St. Louis with gas is to receive 50 cents per thousand.

We regret to chronicle the death of architect Geo. H. Miller, whose office was in the Flood Building.

Owing to complications arising from the death of Mr. Gray, of Gray & Stover, the firm has assigned the contracts it had on hand at the time of Mr. Gray's death, to be completed by the assignees.

We see that the French authorities have issued an order directing the secretary and others connected with collapse of the copper syndicate to be handed over to the correctional police to be dealt with.

There is now being erected a skating rink in Paris, covering a plot of ground about 300 feet in diameter. The ice will be made artificially. Would not such a rink pay in San Francisco?

The Boston Architectural Club proposes to hold an exhibition of architectural work, beginning May 12th, and continuing three weeks. Contributions should be sent in not later than April 15th. R. C. Sturgis is the Secretary of the club.

Doe Brothers, sash and blind manufacturers at 44 Market street, San Francisco, are about to construct a six-story building on the gore lot bounded by Market, Hayes and Larkin streets. A theater, second only in capacity to the Grand Opera House, and of most modern style, will occupy a portion of the buiiding.

The National University of Chicago has arranged for a National Circulating Library of 20,000 volumes, to aid in its University Extension work, modeled after the English system. The The volumes will be sent by mail from Maine to Texas. It will supply a long felt want. To cover expenses, catalogues are sent only on receipt of ten cents. Address 147 Throop street, Chicago, Illinois.

Los Angeles gets her additional appropriation of $370,000 for the enlargement of the postoffice building. This was a necessary step to insure a suitable Federal building for the city. It is to be hoped that this money will be available at an early day, and that work on the structure will soon be resumed. The coming summer may be a quiet one in business, and the employment of mechanics and laborers on this building will help out materially.

Wm. Ward, an architect of Salt Lake City, suggests that future competitions require drawings to be made to a scale much smaller than that usually employed, say 20 or 25 feet to the inch, such drawings to be made with black ink *only*, and any drawings submitted larger than called for to be reduced by photography to the standard scale before being compared with the other designs. This would save competitors much labor in making elaborate drawings and allow many sets of drawings to be examined and compared at the same time.

Four women were engaged last week working as bricklayers on a building corner of Montgomery avenue, Dupont street and Hinckley alley. All the four were dressed in men's clothes, and though not very competent workmen toiled very faithfully and hard. The occasion of the work was the order of the Street Superintendent that a brick foundation should be built under the wooden house on the corner. Although willing the women were not skillful, and yesterday regular male brick-layers were called in to take down what the women had built, and construct the foundation in a proper manner. It is stated that one of the women insisted on doing the work herself and superintending the job.

The report of the Grand Jury shows that a new county jail is an imperative necessity. The present one is neither safe nor comfortable. The property of the people of this city has been pretty severely taxed the past year, but we do not know that this fact has anything to do with the obligation of the people to maintain safe and healthful public buildings. If the people cannot find some way to elect men to responsible offices who will not waste a third or more of our municipal revenues, they must stand the consequences of their own incapacity. But the small taxpayer, who has just succeeded in getting together the heavy tax of last year, will be inclined to ask himself why, with all these taxes, the city is in need of so many things. It is not only the County Jail, but the school-houses, the Police and Fire departments which are kept in a state of inefficiency by the lack of conveniences which are supplied in other cities with less revenue than we provide.

The American Architect and Building News has the usual quantity of interesting matter.

In the *Architectural Era* for February will be found a continuation of *Good Things Gleaned from Different Eras of Architecture.*

Our esteemed contemporary and near neighbor, *Industry*, will soon have to increase the number of its advertising pages. No better proof could be had of its success.

Architecture and Building under its new name, presents an improved appearance. Its issue of February 15 concludes an article on *The Influence of Materials on the Development of Architecture.*

The Engineering and Building Record for February 15, contains a plan and description of the office of Shepley, Rutan & Coolidge, architects, of Boston, and an interesting account of how these gentlemen conduct their extensive practice.

The National University of Chicago announces a new Spanish Grammar in preparation. It is by Prof. Schele de Vere of the University of Virginia, is written on a novel plan, and will form one of the "University" series of text books.

The February number of *The National Builder* contains, part V of Adolph Cluss' article on *Mortars and Concretes of Antiquity and Modern Times*, describing the manufacture of Portland cement and the chemical actions of its component parts also.

An article by James Renwick, on *Paint and Varnish Blistering and Its Prevention*, and installments of the articles on *Ventilation of Sewers*, and *The Art of Drawing.*

The *Building Budget* for January contains translation of *Viollet le Duc's Dictionnaire Raisonee de l'architecture* and an interesting article on *Adoban Architecture by Andre Matteson*, and proportion in Doric architecture by *Prof. A. Thiersch*, translated by *Prof. N. Clifford Ricker*, also the proceedings of the joint meeting of the Chicago Chapter, A. I. A., and the Illinois State Association of Architects, at which their consolidation was effected.

The February number of the *Western Architect and Building News* is one of the two *special numbers* issued during the year, and is thoroughly deserving of *special* mention. The gelatine plates are as near perfection as choice of subjects, and skill in this process of reproduction combined can attain. The most interesting plates are a general view of the Chicago Auditorium Building, Adler & Sullivan, architects, an interior of the Kansas Senate Chamber, L. M. Wood, architect, a residence designed by John J. Huddart, architect, and a perspective view of the Peoples' National Bank Building by F. E. Edbrooke & Co., architects.

The National Magazine for March, contains the continuation of an interesting article by Prof. Schele de Vere of the University of Virginia, entitled *How We Write*, giving many curious historical facts. Rev. J. C. Quinn, L. L. D., contributes *Biblical Literature.* F. W. Harkins, Chancellor of the National University of Chicago, describes the workings of the *National Circulating Library* of 20,000 volumes and the new non-resident courses of study of the University. A timely article on the University Extension system of England is by Rev. C. C. Willett, Ph. B. The ladies will be particularly interested in the new Woman's Institute and a unique plan, here described.

Published on the 1st of each month at 147 Throop street, Chicago, Ill. Sample Copy, 10 cents.

THE LICK BATHS.

We are enabled to present to our readers this month through the kindness of the architects, Messrs. Wright & Sanders, the design for the Lick Free Baths now being erected on Tenth street near Howard street, in this city.

The deed of trust, executed by the late James Lick, providing for the construction and perpetual maintenance of free public baths in this city, reads as follows:

"And in further trust to expend the sum of one hundred and fifty thousand dollars under direction of H. M. Newhall, Ira P. Rankin, Dr. J. D. B. Stillman and John O. Earl and the survivors of them, in the erection and maintenance in the city of San Francisco of free baths, the site or sites therefore to be acquired and held by the persons last named and the survivors in trust forever to maintain such baths for the free use of the public under proper and reasonable regulation, said baths to be erected as soon as practicable to raise the money after the money has been provided to erect said telescope."

The building has now been in course of construction for several months past, and is so far advanced as to afford the observer a good idea of the handsome appearance it will present when completed. The facade has a frontage of 76 feet and the material employed is San Jose sandstone, very effectively treated. The main entrance is in the center, and opens into a spacious vestibule, flanked by separate waiting rooms for men and women. There are forty separate bath rooms in the men's department, and half that number in the women's; each room is furnished with an enameled iron bath tub, and the whole well lighted by large skylights.

Tanks for hot and cold water are located in the tower, which is situated near the center of the building.

Apartments have been provided for the employees in the second story, and every convenience provided for the work they will be called on to perform,

Following that which we have written relative to the *Lick Baths*, we learn that the *Joshua Hendy Machine Works*, whose place of business is at No. 54 Fremont Street, this city, furnished the boiler, engine and all of the necessary shafting, pulleys, etc., connected therewith and as well the *Laundry Machinery* from the Pacific Laundry Machinery Company.

This Laundry Machinery comprises hot and cold water tanks having a capacity of 10,000 gallons each, and the further assessories of a washing machine, mangler, centrifugal hydro-extractor, soap tanks, etc.

The drying room is to be specially constructed of iron upon plans and specifications prepared by the manager of the Pacific Laundry Machinery Company, the office of which is at No. 51 Fremont Street, this city.

Mr. Jos. F. Forderer, 226 Mission street, is doing the galvanized iron and slate work. The front roofs are covered with California slate, the rear ones being of corrugated iron. The skylights are built with the Forderer patent, of which Mr. Forderer is the patentee. Persons contemplating building should call on Mr. Forderer and inspect his skylight, as it has many advantages over other styles. The partitions in the bathing department are all built of galvanized iron. Mr. Forderer is well known to the building community and the public in general, as doing nothing but first-class work in his line of business, and having acquired an enviable distinction will always endeavor to maintain it.

The plumbing in this establishment is, as its name implies of great importance and the work therefore was to be done in the most approved sanitary manner, and with the lastest and best plumbing appliances as well as to have it durable. Mr. W. F Wilson, whose place of business is at 204 Stockton street in this city, was therefore choosen by the architects and the trustees for the Lick Baths, to perform this branch of the building, and who has spared no time or trouble to make the plumbing in this building, a credit to those who entrusted him with this work as well as to himself. The drainage pipes are of extra heavy cast iron, and so arranged under the cement floor that any part of it can be cleaned or flushed at any time, these drain pipes empty into large cast iron tanks specially designed for this building by Mr. Wilson, and by this means making it impossible for sewer gas to enter the building. As an extra precaution, the drains are constructed in such a manner, that there is a constant circulation of air passing through these pipes from rear to front of building.

The traps for bath-tubs, catch-basins or floor strainers are of a unique pattern as are also the waste and supply fixtures to the bath-tubs. A marked feature in this plumbing is the absence of lead pipes, no lead pipe of any kind to be used in the connection of any part of the plumbing in the Bath House, all material being extra heavy, strong, cast iron, or heavy brass, thereby avoiding the risk of having any part of the plumbing damaged by carelessness or intent; the bath tubs, made of solid porcelain, are 2½ inches thick and weigh each about 800 lbs. Each tub is set and connected in such a manner that it can be uncoupled and removed without interfering with any other part of the plumbing,—the supply to the bath-tubs are taken from two large tanks situated in tank-tower, and consist of galvanized iron pipes 4 inches in diameter, and sufficiently large to fill each tub in about 2 minutes. A large and commodious room is fitted up for gentlemen with a combination needle and shower bath something entirely new, and will be enjoyed by those who know the benefit of such a luxury, the plumbing in lavatories and toilet rooms are in keeping with the work in the bath-rooms. The water-closets are of the latest approved pattern, with a large square opening and are known as the *Pedestal Syphonia*, each water-closet is furnished with an antique oak seat and cistern and is automatic in action, the urinals are of petroleum, the floors, sides and back of which are of California slate, the supply to each through an automatic periodical flushing cistern.

J. Steuart Mackay, whose office is No. 330 Sutter Street, room 3, has the contract for the performance of the carpenter work. Mr. Mackay is a well known builder of long standing in the community, and has erected many prominent buildings in and around this city. Being a thorough man of business as well as a competent mechanic, attentive to his work, and careful to fulfil all agreements to the satisfaction of his clients; it may be stated without hesitation that he will take particular pride in carrying out this important contract, in such a manner as to reflect credit on himself and the architects who designed the work.

Messrs. W. W. Montague & Co., of 309 and 317 Market street, have the contract for the tile work and their name is a sufficient guarantee that the work will be done in an artistic manner and the material will be of the best.

The offices and waiting rooms are wainscoted with English glazed tile in light cream with a Grecian border in colors, and the floors and halls of the rooms are laid with encaustic tileing in mosaic designs and colors. The walls of the main bath rooms are all wainscoted with English cream colored tile from floor to ceiling with a Tennessee marble base running all around.

The plastering has been let to Mr. Charles Dunlop, who is an experienced man in his line of business, and as the result of his knowledge and ability, he secures a great deal of the best work in the city. His headquarters are at 330 Pine street, at the Builders' Exchange. Among the prominent buildings lately plastered by Mr. Dunlop, may be mentioned the First National Bank, corner of Sansome and Bush streets, and the Strathmore Apartment House on Larkin street. He has also contracted to do nearly twenty thousand dollars worth of work for the new building now being erected for the California Academy of Science on Market street.

Messrs. Fraser & Keefe, the well known painters of 317 Sutter street, whose exhibit at the last Mechanics' Fair attracted such universal attention, have the contract for the painting and glass work. The work done by these gentlemen speaks for itself. By a long series of experiments they have discovered certain methods of treating natural woods so as to bring out the beauties of the natural grain, and persons wishing to have this kind of work done in a first-class manner, would do well to call and examine specimens of wood so finished, which can be seen at their place of business, 317 Sutter street, between Grant avenue and Stockton street.

Mr. George Goodman, of 307 Montgomery street, has the contract for the foundation and artificial stone work. As the foundation of a building designed to stand for any length of time is of the first importance, it is essential that the composition be the best and that the mixing be done in a thorough manner; his name is a guarantee that the requirements called for has been fulfilled. The sidewalk will be laid with artificial stone, of which he is the patentee and manufacturer. Mr. Goodman has had many years of experience in this business, and does nothing but first-class work.

CITY BUILDING NEWS.

Alpine and Fourteenth. 3-story; owner, D. Swannack; architects, Townsend & Wyncken; contractor, D. Currie; cost, $5,494; signed, Feb. 19; filed, Feb. 19; payments: $600, main floor beams are on; $400, framed: $1,168 ready for lathing; $1,000 work is up and primed; $500, white coat of mortar is on; $500, inside is trimmed; $1,366, 35 days.

Bryant and Third. Concrete cementing and excavating; owner, E. G. Lyons & Co.; architect, Wm. Mooser; contractor, Chattain Gilletti; cost, $20,500; time, 68 days; sureties, Byron Diggins & Diggin Bros., $13,000; filed, Feb. 25; signed, Feb. 24; payments, 75 per cent. of value of work done; balance, 35 days.

Bryant and Third. Brick work; owner, E. G. Lyons & Co.; architect, Wm. Mooser; contractor, J. W. Wissinger; cost, $24,850; sureties, C. C. Rohlffs and D. Dodge, $16,000; filed, Feb. 25; signed, Feb. 21; payments, 75 per cent. of value of work done; balance, 35 days.

Bryant and Third. Stone and plastering; owner, E. G. Lyons & Co., architect, Wm. Mooser; contractor, Jno. McCarthy; cost, $13,284; time, 60 days; sureties, J. F. Logan and T. W. Peterson; signed, Feb. 21; filed, Feb. 25; payments, 75 per cent. of value of work done; balance, 35 days.

Church, between Ridley and Fourteenth streets. Owner, Ann Shattuck; architect, T. J. Welch; contractor, Jas. Campbell; sureties, A. W. Starbird and J. B. Goldstone, $5,000; time, 3 months; signed, Feb. 24; filed, Feb. 28; payments, $1,925, enclosed: $1,925, brown coated; $1,925, completed; $1,925, 35 days.

Chattanooga and Twenty-Fourth. Frame building; owner, Robt. McElroy; architect, J. Marquis; contractor, David Perrey; cost, $2,225; signed, March 4; filed, March 4; payments, $350, chimneys are up; $400, building is ready to lath; $400, brown coat of mortar is on; $315, completdd; $360, 35 days.

Drumm and Sacramento. Carpenter work; owners, Mahony Bros.; architects, Ashton & Stone; contractor, John Trotter; sureties, John F. Kennedy and Geo. T. Shaw, $2,000; cost, $5,559; signed, Feb. 27; filed, Feb. 28; payments, 75 per cent. of value of work done as it progresses; balance, 35 days.

Ellis and Franklin. Frame building; owner, Henry Payot; architect, Wm. Mooser; contractor, M. C. Lynch; cost, $5,362; sureties, Henry Blythe and J. T. Trott, $3,000; signed, Feb. 13; filed, Feb. 18; time, 75 days; payments, 75 per cent. of value of work done; balance, 35 days.

Ellis and Buchanan. Painting and graining; owners, Morris Brinn and Philip Flatlow; architects, Salfield & Kolberg; contractor, J. A. Mohr; cost, $850; signed, Feb. 17; filed, Feb. 17; payments, $300, outside has two coats; $325, accepted; $225, 35 days.

Eleventh and Folsom. To complete building; owner, Jas. Scobie; architect, Oliver Everett; contractor, Cook Stover; sureties, Jno. Wagner & Chas. Dunlop; filed, Feb. 19; signed, Feb. 19.

Ellis between Polk and Van Ness Avenue. 3-story frame; owner, A. Pauba; architects, Kenitzer & Kollofrath; contractors, Shutt & Kreker; sureties, T. Hock and J. C. Jensen, $8,000; cost, $9,257; time, May 31, '90; signed, Feb. 18; filed, Feb. 19; payments, $1,500, frame is up; $1,200, roofed; $1,500, first coat of plaster is on; $1,200, plastered; $1,457, entire work is completed. $2,700, 35 days;

Ellis and Buchanan. Carpenter work; owner, Morris Brinn & Philip Flatlow; architect, Salfield & Kohlberg; contractor, H. Holzenberg; sureties, J. F. Kennedy and Geo. T. Shaw, $13,000; cost, $13,000; signed, Feb. 7; filed, Feb. 17; payments, $1,000, up to second floor; $2,000, framed; $2,000, partitions set; $2,000, doors and windows hung; $2,750, accepted; $3,250, 35 days

Ellis and Buchanan. Plumbing, etc.; owner, Morris Brinn & Philip Flatlow; architect, Salfield & Kolberg; contractor, Sam'l Ickelheimer; cost, $1,550; signed, Feb. 7; filed, Feb. 17; payments, $500, rough work is in; $650, accepted; $400, 35 days.

Ellis & Buchanan. Plastering; owners, Morris Brinn & Ph. Flatow; architect, S. V. Kohlberg; contractors, Brennan & Fraser; cost, $1,569; signed, Feb. 24; filed, Feb. 28; payments, $600, brown coat is on; $869, plastering is finished; $400, 35 days.

Ellis and Leavenworth. 3-story frame; owner, Chas. Meyer; architects, John & Balczynski; contractor, Wm. Pluns; cost, $13,640; signed, March 1; filed, March 3, payments, $2,500, frame; $2,500, partitions are set; $2,500, outside finish is on; $2,-780, inside finish is on; $3,410, 35 days.

Ellis and Franklin. Plumbing, etc.; owner, Joseph Getz; architect, Wm. Mooser contractors, Thos. Clark & Son; cost, $1,100; signed, March 5; filed, March 7; payments, 75 per cent. of value of work done; balance, 35 days.

Ellis and Leavenworth. Concrete work; owner, Johann A. Schmidt; architect, Julius E. Kraft; contractors, Ransome & Cushing; sureties, C. E. Greene and F. M. Smith, $3,000; cost, $4,173; signed March 1; filed March 3; payments, $1,400, all walls are up to one-half height; $1,723, completed; $1,150, 35 days.

Ellis and Franklin. Carpenter work; owner, Jos. Getz; architect, Wm. Mooser; contractor, J. R. Whalen; sureties, O. H. Greenwald and J. Levi, $9,000; cost, $13,482; signed, March 5; filed, March 7; payments, 75 per cent. of value of work done; balance, 25 per cent., 35 days.

Ellis and Franklin. Artificial stone work; owner, Jos. Getz; architect, Wm. Mooser; contractor, Geo. Goodman; cost, $835.50; signed, March 5; filed, March 7; payments, 75 per cent. of value of work done; balance when completed.

Grove and Shrader. One-story cottage and 2-story stable; cost, $4,000; owner, John Hasshagen; contractors, Droge & Munster; time, 100 days; signed, Feb. 24; filed, Feb. 28; payments, $750, rough frames are up; $750, brown coated; $750, outside finish on; $750, accepted; $1,000, 35 days.

Grove and Lott. Frame building; owner, Chas. G. Gebhardt; architect, Edward Burns; contractor, Jas. J. Mauseau; sureties, Jas. Greig and Ed. P. Blake, $1,800; cost, $3,500; time, 75 days; signed, Feb. 17; filed, Feb. 28; payments, $750, rough frame is bridged and braced; $800, rough plumbing done; $1,100, completed; $940, 35 days.

Golden Gate Ave. between Baker and Lyon. Frame; owner, Henry Osbourne; architect, Bernard Dreyer; contractor, Bernard Dreyer; cost, $8,000; time, 90 days; signed, March 5; filed, March 7; payments, $2,000, framed; $2,000, brown coat of mortar is on; $2,000, white coat of mortar is on; $2,000, 35 days.

Hyde and Vallejo. Alterations, etc. Owner, Mrs. Duffy; architect, J. F. Hayes; contractor, J. F. Hayes; cost, $340; signed, Feb. 17; filed, Feb. 18; payments, $100, roof of old house is shingled; $60, floor is laid; $100, brown mortar is on; $100 complete; $180, 35 days.

Harrison and Sixth. 3-story building; owner, J. Verdenhalven; architect, Henry Geilfuss; contractor, Henry Minster; cost, $3,475; signed, Feb. 28; filed, March 1; payments, $650, framed; $650, partitions are set; $650, finish completed; $655, completed; $870, 35 days.

Hardy and Kearny. Cast-iron work; owner, G. T. Watterson; architect, J. Marquis; contractors, O'Connell & Lewis; cost, $6,745; signed, Feb. 28; filed, March 3; payments, $1,700, third story joists are on E. ⅓ of building; $800, third story joists are on W. ⅓ of building; $1,660, completed; $1,745, 35 days.

Howard and Eighteenth. 3-story frame; owner, Wm. Perkins; architects, R. H. & R. White; contractors, H. O. Noyes & E. W. Hyde; cost, $6,657.50; signed, March 1; filed, March 1; payments, $887.50, roof boards are on; $1,000, rear frames are up; $1,100, brown coat of mortar is on; $1,000, standing finish is on; $1,000, completed; $1,670, 35 days.

Hardy Place and Kearny. Carpenter work; cost, $11,325; owner, Chas. Schroth; architect, J. Marquis; contractor, J. R. Wilcox; signed, Feb. 25; filed, Feb. 27; payments, $2,800, roof joists and boards are on; $2,800, building ready to lath; $2,850 accepted; $2,975, 35 days.

Hardy Place and Kearny street. Grading, excavating, brickwork, iron work, etc; cost, $32,005; owner, Chas Schroth; architect, J. Marquis; contractor, Geo. T. Matterson; filed, Feb. 27; signed, Feb. 25; payments, $2,000 E½ of basement is up; $5,500, third story joists are on E½; $2,000, W½ of basement is up; $5,500, joists are on third story; $2,000, fifth story floor joists are on; $6,950, brick work is all finished.

Howard and Capp. Cost, $3,260; owner, Mary E. Von Shroeder; architect, T. J. Welch; contractor, Gray Bros., A. S. P. Co; filed, Feb. 26; signed, Feb. 16; payments, 75 per cent. of value of work done; balance, 35 days.

Howard and Tenth. Machine work; cost, $6,965.

Hardy and Kearny. Stone-work; owner, G. T. Watterson; architect, J. Marquis; contractors, F. E. Knowles & Co.; cost, $2,960; signed, Feb. 28; filed, March 3; payments, $500, third-story joists are on E ½ of building; $700, third-story joists are on W of ½ building; $1,000, completed; $760, 35 days.

Hardy and Kearny. Wrought-iron and steel work; owner, G. T. Watterson; architect, J. Marquis; contractors, C. Nutting & Son; cost, $3,000; signed, Feb. 28; filed, March 3; payments, $1,700, third-story joists are on E. ⅓ of building; $800, third-story joists are on W. ⅓ of building; $650, completed; $750, 35 days.

Jackson and Scott. Owner, Albert Gallatin; architect, Clinton Day; contractor, John T. Grant; cost, $37,591; time, 5 months; signed, March 5; filed, March 7; payments, $4,500, roof is ready for slating; $9,000, prime coat of paint on; $10,500, all inside finish is on; $4,194, completed; $9,397, 35 days.

Laguna and Pacific Avenue. Carpentry work of seven houses; owner, D. F. Walker; architect, Wm. F. Smith; contractor, F. W. Kearn; cost, $36,500; signed, Feb. 15; filed, Feb. 19; payments, $6,483.75, framed; $6,483 75, ready for plaster; $6,483.75, standing finish is on; $6,483.75, completed; $9,125, 35 days.

Larkin street wing of New City Hall. Brick work, etc. Owners, Hughes & Foster; architect, W. Patton; contractor, J. Wagner; cost, $4,000; signed, Feb. 14; filed, Feb. 18; time, 3 months; payments, 75 per cent. of value of work done as it progresses; balance, 35 days.

McAllister and 1st Avenue. 1-story and basement; cost, $1,350; owner, Mrs. Limmermann; architect, P. R. Schmidt; contractors, Droge & Munster; time, April 18, 1890; filed, Feb. 27; signed, Feb. 24; payments, $350, frame is up; $350, roof is on; $350, outside finish is on; $350, finished.

Market and Golden Gate Avenue. Brick-work; owner, Joseph Donohue; architect, A. Page Brown; contractors, Richardson & Gale; cost, $39,260; signed, March 5; filed, March 4; payments, 75 per cent. of value on work done on the first Friday of each month; balance, 35 days.

Nineteenth and Fair Oaks streets. 2-story frame; owner, Jno. Roberts; architect, Chas. Shaner; contractor, Chas. H. Foster; surety, J. Pierce and E. B. Dunning, $1,200; cost, $2,460; time, 105 days; signed, Feb. 14; filed, Feb. 17; payments, $300, frame is up; $400, cornice on; $400, stairs up; $350, brown mortar on; $395, windows are in; $675, 36 days.

New City Hall. Plumbing and gas fitting; contractors, Lawton & Britt; owners, Hughes & Foster; cost, $2,789; signed, Feb. 11; filed, Feb. 18; payments, 75 per cent. of value of work done; balance, 35 days.

Oak & Devisadero. Three 2-story frames; owner, Charles C. McDougall; architect B. McDougall & Son; contractor, John H. McKay; cost $8,000; signed, March 1 filed, March 1; payments, $1,400, framed; $1,400, brown coated of mortar is on; $1,400, one cont of paint is on; $1,500, completed; $2,000, 35 days.

Oak and Devisadero. 2-story frame; owner, M. J. Sahlein and wife; architect, B. McDougall & Son; contractor, Alex. J. Wheeler; cost, $6,200; signed, March 1; filed, March 1; payments, $500, basement story up; $600, framed; $600, roof tinned; $600, inside stairs up; $600, brown mortared; $600, white mortared; $700, completed; $2,000, 36 days.

Polk, between Hayes and Fell. 3-story frame; owner, Mrs. M. Ivine; architect, P. R. Schmidt; contractor, Wm. T. Commary; sureties, C. G. Greenwald and G. Kurster, $8,050; signed Jan. 28; filed, Feb 15; cost, $8,050; time, 100 days; payments, $1,500, rough frame up; $1,500, brown mortar on; $1,500, hard finish on $1,500, completed; $2,050, 35 days.

Page and Ashbury. Two frame stable; owner, J. L. White; architect, A. J. Barnett; contractor, Rountree Bros.; surety, F. Joost, $5,500; cost, $6,875; time, 75 days; signed, Feb. 15; filed, Feb. 18; payments, $1,500 roof boards are on; $1,000 brown mortar on; $1,650, white mortar on; $1,000, completed; $1,725, 35 days.

Post and Devisadero. Two-story frame; owner, Jos. Robinson; architect, C. Zwierlein; contractor, C. Zwierlein; surety, F. Joost, $2,000; cost, $37,500; signed, March 4; filed, March 7; payments, $700, framed; $700, brown coat of mortar is on; $700, outside mill finish is on; $700, completed; $940, 35 days.

Point Lobos and Eighth Avenue. Two-story frame building; owner, C. Giese; contractors, Schultz & Meeker; surety, T. C. Jensen, $4,000; cost, $4,000; time, 65 days; signed, March 4; filed, March 5; payments, $900, roof is boarded; $1,000, brown coat of mortar is on; $1,000, accepted; $1,100, 35 days.

Shotwell and Twenty-third. Additions, etc.; owner, A. Schaar; architect, J. E Kraft; contractor, Wm. Paterson; surety, Chas. H. Ackerson; cost, $3,250; signed, Feb. 18; filed, Feb. 19; payments, $725, roofed; $700, all interior finish on; $1,000 when completed; $825, 35 days.

Scott and Sutter. Plumbing, etc.; owner, Geo. Hageman; architect, Chas. I. Havens; contractor, G. C. Sweeney; cost, $2,147; signed, March 6; filed, March 8; payments, $750, all rough pipes are in; $797, completed; $600, 35 days.

Scott and Sutter. Brick-work, carpenter work, etc.; owner, G. Hageman; architect. Chas. Havens; contractor, F. W. Kern; cost, $18,890; signed, March 6; filed, March 8; payments, $5,500, diagonal boarding is on; $5,500, outside finish is on; $3,500, outside mill work is all on; $3,690, completed; $4,800, 35 days.

Sanchez and Twenty-sixth. Seven 5-room cottages; owner, Louis Landler; architect, J. E. Loomer; contractor, J. E. Loomer; cost, $9,450; time, 5 months; signed, March 7; filed, March 8; payments, $3,150, roofed; $3,150, brown coat of mortar is on; $3,150, 35 days.

Scott and Ellis. Alterations and additions; owner, Chas. Meyer; architects, John & Balczynski; contractor, Wm Plunz; cost $2,275; signed, March 1; filed, March 3; payments, $1,700; underpinning of old house done; $575, 35 days.

Shotwell, between Twenty-third and Twenty-fourth. Frame building; owner, Mrs. H. C. Adams; architect, M. G. Bugbee; contractor, R. O. Chandler; cost, $2,625; signed, Feb. 18; filed, Feb. 18; payments, $656.50 enclosed; $656.50 brown mortar on; $656.50 accepted; $656.50 35 days.

Scott and Sutter. Painting, etc.; owner, Geo. Hageman; architect. Chas. I. Havens; contractor, Jos. Thomas; cost, $1,365; signed, March 6; filed, March 8; payments, $500, inside is second coated; $315, all work is completed; $350, 35 days.

Van Ness Avenue and O'Farrell. Decorating, etc.; owner, P. W. Riordan; architect, T. J. Welch; contractor, Moretti & Trezzini; cost, $6,500; signed, Feb. 20; filed, Feb. 20; payments, monthly, 75 per cent. of value of work done; balance, 35 days.

Van Ness Avenue and Myrtle. Four-story frame building and alterations; owner, L. A. Levy; architect, P. R. Schmidt; contractor, J. F. Logan; sureties, C. Greenwald and I. Levi, $63,300; cost, $63,300; time, Nov. 1, '90; signed, March 3; filed, March 4; payments, $6,000, second-story joists are laid; $6,000, rafters on; $6,000, roofed; $6,000, ready for plaster; $6,000, brown coat of mortar on; $6,000, hard finished; $6,000, standing finish is up; $5,475, completed; $158.25, 35 days.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE ARCHITECTS, meets second Friday of each month at 408 California Street.
SETH BABSON, Pres. W. P. MOORE, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at 408 California Street.
JOHN RICHARDS, Pres. PROF. FRANK SOULÉ, Vice-Pres.
OTTO VON GELDERN, Sec. JAS. SPIERS, Treas.

THE regular monthly meeting of the San Francisco Chapter of the American Institute of Architects was held on Friday evening, April 11th. President Babson in the chair. M. G. Bugbee desired to be advanced to fellow membership. The Committee on binding exchanges made their report and were discharged. It is hoped that the volumes (nearly a dozen in all) will form the nucleus for a valuable architectural library for the use of members of the Chapter and students of the Chapter's classes.

The proceedings of the New York Chapter at their last regular and special meeting were received, and the Secretary ordered to suitably acknowledge the courtesy.

The documents in relation to the Aug. Laver and City Hall case were received from Mr. Root, the Secretary of the A. I. A., and referred to a committee to formulate a suitable reply.

A committee of three was appointed to revise the constitution and by-laws of the Chapter, and make them conform to the requirements of the new constitution of the American Institute of Architects.

Mr. Sanders, the teacher of the class in architectural drawing, presented several drawings by his pupils, on the subject of a design for a frieze.

An interesting subject was broached by Mr. Sanders who suggested the formation, by the architects, of a joint stock company to erect a building designed for the accommodation of scientific, artistic and kindred societies, and to serve as a headquarters for associations of a like nature.

The matter will be discussed more in detail at the next meeting, and if decided to be advisable and practicable, there appears to be a likelihood of the idea taking definite shape.

THE regular monthly meeting of the Technical Society of the Pacific Coast was held Friday evening, April 4th. A communication was read from the American Society of Engineers, requesting the society to make certain tests at the Bear Valley arch dam, when the newer and higher dam relieves the present structure of the pressure it sustains.

It is hoped that by making such observations, valuable information may be obtained on the elasticity of masonry, as such an opportunity may never occur again. A committee consisting of Messrs. E. J. Molera, R. E. Browne, Prof. F. Soulè, and Luther Wagoner was appointed to take charge of the matter, and to request the co-operation of Messrs. A. Lietz and Joseph Sala, as scientific experts.

The paper of the evening was then read by Randell Hunt, C. E., on "Coffer Dams" treating also of the construction of open caissons.

Mr. Wagoner then explained some experiments he had made on stretching steel bars beyond the limit of their elastic strength.

RETAIL LUMBER DEALERS PROTECTIVE ASSOCIATION.

THE retail lumber dealers of this State, have organized an association to protect their business against the encroachments of the manufacturers of and wholesale dealers in lumber, and to enforce the principle that the wholesale and retail are separate branches of the trade, and that no wholesale dealer should violate the established usages by encroaching on the prerogatives of the retail dealers by selling to consumers.

About seventy-five delegates were present at the meeting which was held at the Chamber of Commerce on April 9th, and they represented about four-fifths of the retail dealers of the State.

A. W. Starbird of San Francisco was elected chairman, and Henry Rogers of Oakland as Secretary with Edward Raum as Assistant Secretary.

A constitution and by-laws were adopted; the most important section, provides that whenever any wholesale dealer or manufacturer or their agents shall sell to any person not a regular dealer, or to any lumber-dealer, not a member of the association, upon information lodged by any member doing business in that district, the Secretary shall notify such manufacturer or wholesale dealer who made such shipment, that he has a claim of 10 per cent of the value at retail rates prevailing at point of destination of such sale against him for such shipment. In the event of such wholesale dealer defying the Secretary or Board of Directors, the list of those with whom the association may trade will not include his name, and any member then dealing with him will be expelled from the association.

Provision is made against making any such complaint on account of lumber sold to original manufacturers, or wholesale dealers in their legitimate business, or steam railroads operated by locomotives.

Section 7 states that it is contrary to the spirit of the organization for one retailer to ship lumber into the territory of any other retailer, both being members of the association, at less than the rates established by the retailer for that territory, providing said rates are not higher than the established retail rates at the main point of supplies for that territory, with freight added.

After the adoption of the by-laws the election of Directors was proceeded with. Messrs. George W. Hooper, George H. Payne and S. L. Richards were elected to serve one year, representing respectively San Francisco, Alameda County and Sacramento. The three elected to serve a term of two years were J. F. Kennedy of San Francisco, William Dougherty of San Jose and A. Powell of Alameda County. For the three-year term Colonel W. C. Little, S. H. Harmon, representing San Francisco, and H. G. Stephenson representing Los Angeles, were elected.

The Directors will hold weekly meetings to carry out the objects of the association.

PROPER HABITATIONS FOR ALL.

ALTHOUGH the well-to-do mechanics and tradesmen have ample house accommodation at present, yet we see signs here, as the city of San Francisco grows and assimilates itself more and more to the old cities of the country east of the Rockies, of a growing lack of accommodation for purposes of habitation for the poor, and those unfortunate enough to be in the ranks of those who lack the power of being successful.

This matter will have to be grappled with here, as it has already been found necessary to grapple with it in London, and other overcrowded cities of the old world.

The abstract justice of the duty of those supplying their quota of labor for the common good, to supply themselves with proper habitations, is now pretty well conceded. A state of society failing to do this has already been condemned by many of our deepest thinkers. It seems hopeless however to leave the matter in the hands of capitalists, for although taking London as an example, a number of paying investments of this kind have been made, it is as but a drop in a bucket of water. Capitalists would rather put their money in a more speculative and presumably a better paying investment. There is no doubt that any effective work done in this line must be done by the collective efforts of the citizens working through the municipality. It seems also to be the *duty* of such, in view of the bad effect of unhealthy and unsanitary homes upon the character and morals of its citizens.

Though this may seem a bold suggestion at first, yet everything points in every direction to collective effort in all departments of social life; and it will be the way also in that of providing homes for its constituents.

The best way of dealing with the problem of such an important social question, will not be further entered into here; but left for the working out of our readers.

THE GRANT MONUMENT.

TWO years or more ago the Grant Monument Association of New York, invited artists, architects and sculptors to submit competitive designs for the memorial to be erected in honor of General Grant. Apparently the prizes offered were not large enough to tempt a competent artist, architect or sculptor to devote the time and study necessary to involve a suitable and appropriate project, as out of the seventy or eighty designs delivered to the Committee, not one was deemed by experts, to possess sufficient merit to warrant its adoption.

It is to be hoped that some day Committees, and the public in general, will become sufficiently educated to perceive that it is folly to expect to obtain first-class material by offering third rate inducements.

We are pleased to see that other than architectural journals are aware of the futility of such proceedings, and quote the following from *Harper's Weekly* upon the subject in question:

The Grant Monument Committee has learned by experience what it should not have needed experience to learn, that the masters in the plastic arts do not enter into competition for such work. The reasons for this fact are many and various, but the fact is unquestionable. It is certainly to be expected that the reputation of an artist will be as serviceable to him as that of a man of science or of the learned professions. If a mining company wishes to have the quality and character of its ores determined, it applies to an expert whose distinction is due to his proved ability. If a Committee wishes a statue, or a portrait, or a monument, application to an expert would seem to be equally natural.

The preparation of designs for such a work as the Grant memorial involves a great deal of time and money. The masters in the art are not obliged to depend upon the chance of approval of their designs. They can use their time for labors which are sure to bring a return. If therefore, a Committee should ask a service of them which would be properly reimbursed, if it were only the preparation of designs, the masters, or at least some of them, would be glad to do that work as they would do any other. In this way designs of the proper character could be procured.

This course need not exclude a competition of such others than recognized chiefs as might be willing to try for a prize and an opportunity. The triumph would be greater if achieved in comparison with the works of men of established name. If, however, such men should decline to take any part short of the execution of the work, the result would be either an original selection among acknowledged masters, or among such as were willing to compete. In the case in question we understand that the Committee was advised to invite what was practically such a mixed paid and unpaid competition as we have mentioned, but decided to take the course which has failed to lead to the result desired, none of the designs being satisfactory. The Committee will do well to hasten slowly in the completion of a work so important.

EXAMPLE OF FRENCH GOTHIC.

SUGAR AND MORTAR.

SOME time ago the statement that the mixture of a small quantity of sugar with mortar greatly improved the latter, excited the risible faculties of the building fraternity. The notion was regarded as too ridiculous for serious consideration. There is, however, reason to believe that the addition of saccharine matter to mortar is an extremely valuable discovery. In the first place, it enables bricklaying to be carried on in the frosty weather.

About two pounds of coarse brown sugar to a bushel of lime and two bushels of good sand will supply the proportions for a mortar that will resist frost admirably. It is claimed, however, that in addition to this advantage, mortar with sugar mixed in it is vastly superior to mortar without it. It sets as hard as cement very soon, makes the brickwork extremely strong and quite effective when used with dry bricks. For indoor plastering, also, saccharated mortar sets hard quickly. When portions of the same wall have been covered in one part with sugared and in another with unsugared mortar, the latter has ripped up directly when a nail was run over it, months after the former had become as hard as stone. Much interest is taken in the matter by Mr. Crampton, of Cranleigh, Guilford, and he reports some interesting experiments. He points out that if sugar be added to mortar that is already made, it will render it too thin.

Strong sugared water dissolves lime, in the same way that water dissolves sugar. It is therefore necessary to dissolve the sugar in water first, and then add the sugared water to the lime, slowly and cautiously. The mortar should be as stiff as it can be used. For lime washing, one pound of sugar to sixteen gallons of water will make it adhere splendidly. Drops of whitewash made with water so mixed, if they fall on the floor or window, or any iron plate, cannot be washed off. They stick like enamel, and have to be scraped off. Evidently, sugar is not such an absurd thing to mix with lime as the practical man thought. —*The Manufacturer and Builder.*

SANITATION.

There is no doubt that the science of sanitation, as applied to the different features of building, is so far advanced that those professionally interested are possessed of sufficient knowledge to render building secure from unhealthfulness. The question now is how shall the public be educated up to an intelligent appreciation of this knowledge so that they may understand the importance and value of its great offices? There are many people unable to appreciate sanitation in their homes simply because they have not been made acquainted with it. All ventilation or no ventilation, and all drainage or no drainage is the same to them, and they sit in rooms filled with foul air or sewer gas with indifference. They have not been taught otherwise, and need from some source the knowledge that will teach them the value of healthful homes.—*Exchange.*

NEW YORK CHAPTER, A. I. A.

NEW YORK Chapter A. I. A. The regular meeting was held on March 12th. The most important subject brought before the meeting was the proposed "Act to regulate the practice of Architecture within the State of New York."

After a general debate and thorough discussion of the matter from all points of view, the following resolutions were adopted:

Resolved, That the New York Chapter A. I. A., is glad to give its support to the proposed bill before the Legislature of the State of New York, entitled "An Act to regulate the practice of Architecture," but strongly and unanimously urges the suggestion that the proposed provisions in relation to the appointment, as commissioners, of collegiate professors of architecture be changed, so as to provide for the appointment of one professor of architecture for two years, alternately from Cornell University and Columbia College.

Resolved,—That the Chapter is also of opinion that to induce commissioners to act, it will be necessary to provide that they receive a mileage for travel done in the performance of their duties under the proposed act.

The gist of the bill above referred to is contained in our December number, 1889.—[Ed. Cal. Architect.

A SPECIAL meeting was held at the quarters of the Chapter, in the Welles Building, 18 Broadway, New York, on Wednesday, March 26th, 1890, at 3 P. M., President Littell in the chair.

The President stated that the meeting had been called to consider an important subject presented to the Chapter by the Department of Architecture of the Brooklyn Institute, through Messrs. Upjohn and Dickson, Fellows A. I. A., and members of the Brooklyn organization, and of a Special Committee thereof having the subject in charge.

The Secretary then read the following communication from the Department of Architecture, Brooklyn Institute:

DEPARTMENT OF ARCHITECTURE, BROOKLYN INSTITUTE.

At a meeting of the Department of Architecture of the Brooklyn Institute, March 19, 1890, the following preamble and resolutions were adopted:

Whereas, An act has been introduced in the Assembly of the Legislature of this State, and referred to the Committee of Ways and Means, which reads as follows, to wit:

AN ACT FIXING THE SALARY OF THE COMMISSIONER OF THE CAPITOL.

The salary of the Capitol Commissioner is hereby fixed at ten thousand dollars per annum. And it shall be his duty, whenever requested by the proper authorities, to furnish plans and specifications for all public buildings belonging to the State, and to render such services as may be required, without further compensation.

This act shall take effect immediately.

Resolved, That in the judgment of this Department of Architecture of the Brooklyn Institute, the passage of such an act, which is substantially the creation of office of State Architect, will be detrimental to the interests of the people, and the promotion of architecture by preventing free and open competition.

We are therefore opposed to the office of State Architect as not in accord with the culture of the times and the liberality of our institutions, which call for the highest excellence obtainable—the best from the best.

Resolved, That feeling confident we voice every architectural institution in the land, we would respectfully urge that the plans for all public buildings—Federal or State—be given out among our architects for competition, who shall be compensated therefor, and that none but architects be selected to pass judgment upon the architectural merits of such plans.

In thus protesting against the creation of a Government or State Architect, we do so not believing it possible for any individual to possess originality sufficient which, in the designing of a number of public buildings, will not wane into more or less commonplaceness.

Neither do we favor any individual's peculiar standard of architecture, or interference with, or biasing of, that novelty and attractiveness which is rapidly giving American buildings a prestige.

While thus opposing the office of State Architect, we most respectfully suggest this substitute:

That upon the recommendations to the Governor of the State, or the insertion of the names in the act, of three or five architects, from any institution recognized among the profession as authority in architecture, they be appointed and constitute an Advisory Board, having the management of the competition, subject to the rules of said institutions, and of the building until completed, being paid per session for their services; the architects successful in the competition to receive the customary fee, to be accountable to the Advisory Board, which in its turn reports to the State authorities.

A. J. Bloor, Secretary.

THE ARTIST, BY M. F. EHRMANN.

THOMAS POPE'S FLYING BRIDGE.

AN INCIDENT OF ANCIENT HISTORY REVIVED.

We presented in our impression of February an illustration, with suitable description, of a proposed suspension bridge across the East River at Blackwells's Island, which had been seriously contemplated over fifty years ago. The designer of this ambitious project had worked out the details most carefully, and the failure to execute the work cannot be attributed to any defect in these, but rather, as appears most reasonable to assume, to the magnitude of the undertaking; for the structure proposed, for that time, would have exceeded in proportions all others of its class, then existing, as much as the great Forth bridge to-day exceeds all others.

As we have dipped a little into history to revive the memory of one bridge project almost forgotten, it will be pardonable to supplement our article of last month with the description of another yet more ancient, and greatly surpassing the first in boldness of design and originality.

In a now somewhat scarce book (found to-day only in a few public and private libraries), by Thomas Pope, published in 1811, with the title "A Treatise on Bridge Architecture, in which the Superior Advantages of the Flying Pendant-Lever Bridge are fully Proved," etc., the author describes a method of constructing a timber or iron bridge, "with a single arc, on the principle of the lever." The plan described is identical in principle with what is now designated the canti-lever. This fact is all the more interesting to us, since this particular type of bridge structure is generally believed to be of comparatively recent origin, and to have originated with American bridge builders.

Notable examples of this form of bridge architecture, are, in this country, the great steel railway bridge recently built over the Niagara River a short distance below the falls; and, in Europe, the greatest of all bridge structures, the great steel bridge over the Firth of Forth in Scotland.

In view of the publication of Thomas Pope's plan for a "flying bridge," and which clearly describes the principle of construction now called the canti-lever— that is, a bridge in which the superstructure is formed of projecting beams, or levers, fixed at one end to the abutements or piers, and free at the other end—the best that can be said in behalf of the claims of the present generation of bridge builders, is, that it is a revival of an old idea, and that this revival is due principally to American engineers, who were the first to appreciate its merits, and who have adopted the system successfully in the cases of a number of important structures.

To return now to the project of Thomas Pope. From the work above quoted, we learn that he prepared detailed plans and estimates for the construction of a timber bridge, on the canti-lever system, across the East River at New York, and that he constructed a model to illustrate the practicability of his ideas. In his treatise there occurs, in a foot-note, the following reference to this model: "It was built to illustrate a bridge suitable to span the East River at New York with a single arc, the chord of which would be 1,800 feet; the altitude, or versed sine, 223 feet. The abutements were built in the form of so many warehouses, and the whole was erected on a scale of three-eighths of an inch to one foot; the length of the model of half the bridge, in real measure, was nearly 50 feet. The weight borne at one time by the unsupported arm of this diminutive model since finished, has been ten tons, and has astonished the mind of every beholder." From this description, the reader will be able to appreciate the completeness with which Pope had grasped the fundamental principles of the canti-lever system of bridge construction.

The accompanying illustrations—one showing one-half of the structure, to illustrate the self-supporting nature of the lever arm, and the other the completed structure spanning the river with a single arc—speak for themselves. They are reproduced from the frontispiece of Pope's treatise. This notable project, while it challenges our admiration for the boldness of the author's design and the clearness of his perceptions, at the same time calls forth regrets that it was advanced at a time when men were unprepared to entertain it. The project, considering the time and circumstances in which it was put forth, cannot fail to excite the profound interest of the engineer.—*Manufacturer and Builder.*

THREE PUBLIC COMPETITIONS.

The *Cosmopolitan* magazine offers $600 in three prizes of $200 each for the best competition designs on the following subjects: Public Baths, Public Laundries, and Tenement House Co-operative Kitchens.

The Committee of Award is as follows: Richard M. Hunt, President of the American Institute of Architects, Richard L. Hoxie, United States Corps of Engineers, Albert T. D'Oench, ex-Superintendent of the N. Y. City Department of Building, Seth Low, President of Columbia College, Cornelius Vanderbilt and the editor of the *Cosmopolitan*.

The successful drawings are to become the property of the *Cosmopolitan*, and the right to first publish any drawing to rest exclusively with the *Cosmopolitan*, any competitor to submit, if he wishes, drawings for any one, two, or all the prizes, the following programme to apply to each competitor:

Each competitor is required to exhibit two sheets of drawings, one to contain the ground plan, front elevation, and section, with such other drawings as may be necessary to explain the design and construction, all drawn to a scale of one-sixteenth of an inch to the foot, and one to exhibit a perspective view of the whole, drawn to a scale of one-eighth of an inch to the foot.

The plan and elevation sheet to be finished in line with India ink and lining pen; no brush work on this sheet, except in blocking in openings and sections. No shadows are to be cast. The perspective sheet to be rendered at will.

Each sheet to be cut to the uniform size of 24"x32", and to be white card or Bristol board or Whatman paper, mounted on a stretcher. No colored borders, frames, or glazing will be allowed.

Each sheet must be distinguished by a motto or cipher. A sealed envelope bearing the same motto or cipher must contain the name and full address, and must be mailed to the *Cosmopolitan* Magazine Architects' Competition, Madison Square, New York, on or before May 10th, 1890. Drawings are to be delivered flat, carriage paid, at the same time and place. They will be returned at the close of the competition, at the expense of the contributor.

SPECIFICATIONS FOR PUBLIC BATHS COMPETITION.

The drawings shall exhibit a public bath constructed of stone, iron, or equally enduring material.

The structure is to be located on a plot with light on two sides, not exceeding 200x200 feet, any part or all of which may be utilized, and provision to be made for baths in both summer and winter, adapted to the necessities of both sexes in a population of not less than 100,000 people. A letter of explanation must be submitted with the drawings, setting forth the probable cost of maintenance, the number of attendants needed, and any details not apparent in the drawings, but the price of a single bath should not exceed seven cents. The practicable nature of any plan of operation will be considered in determining the award.

SPECIFICATIONS FOR PUBLIC LAUNDRIES COMPETITION.

The drawings shall exhibit a laundry interior for the requirements of one hundred and fifty families of five each.

The floor space shall not exceed 100x25 feet. Written explanations on separate sheets may accompany the drawings.

SPECIFICATIONS FOR TENEMENT HOUSE CO-OPERATIVE KITCHEN COMPETITION.

The drawings shall exhibit a kitchen interior for the requirements of twenty families of five each.

The floor space shall not exceed 50x25 feet. Written explanations on separate sheets may accompany the drawings.

The three subjects are all of a practical nature, and it is more

than possible that by bringing the advantages of co-operative kitchens to the attention of the public, it may be the means of their adoption in future tenement buildings.

The necessity of public baths is quite apparent without calling particular attention to them. There is no doubt that such baths would be liberally patronized. The Lick Free Public Baths, (illustrated in our March number) and which are now approaching completion in this city, will afford an excellent illustration

THE GOLDSMITH, BY M. F. ERHMANN.

of the practical workings of the system. It is to be hoped that after the *Cosmopolitan* has obtained the best plan for this purpose, it will be able to go a step farther and transform the design into a reality. As all large cities now maintain public parks for the enjoyment of their citizens, and public libraries for their use, why should not public baths be instituted and maintained at the public expense?—[*Ed. California Architect.*

A NOVEL use of electricity, and one that will revolutionize the present methods of warming houses, if it can be successfully carried out, is that of heating dwelling houses electrically, without the use of any hot substance. It is claimed that wall paper can be made in such a way that the passage of currents of low electro-motive force will heat it moderately warm to the touch and diffuse throughout the room an agreeable temperature. —*Exchange.*

PERSONALS.

After many years active service as Architect of the Fire Department, P. J. O'Connor has retired. Architect Frank T. Shea has been appointed to the position thus made vacant.

Architect Maxwell G. Bugbee has removed his offices from 330 Pine street to larger and more convenient quarters at No. 419 California street, where he will be pleased to receive his friends and clients.

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all Architects on this Coast and elsewhereto contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth, white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

The handsome interior which we present this month, was designed by B. McDougall & Son, architects, and was one of the drawings illustrating their competitive design for the Olympic Club's proposed new building.

The Fiske building, shown in our lithographs is from a pen and ink drawing by the architect, Harold D. Mitchell, of San Francisco. The building is situated on the southwest corner of Mariposa and J streets, in Fresno, and is owned by J. B. Fiske, who has shown both his enterprise, and his faith in the future and progress of Fresno, by erecting this business block, which it is claimed, is second to none there in solidity of construction and convenience of arrangement.

The style chosen by the architect, is English Renaissance. The roofs and pediments are clearly defined, and present an effective sky line, while the clock tower on the corner of the building makes a very effective feature. The building covers a lot seventy feet by one hundred and fifty, and is four stories in height, besides basement and attic; the basement is nine feet high, fitted up for office purposes, and reached from the sidewalk by flights of wide stone steps, the intermediate openings being utilized for light and ventilation.

The interior of the upper stories has been arranged to conform with the latest ideas concerning suites and offices, each having separate entrances from the halls, yet so arranged as to allow communication if necessary from one to the other.

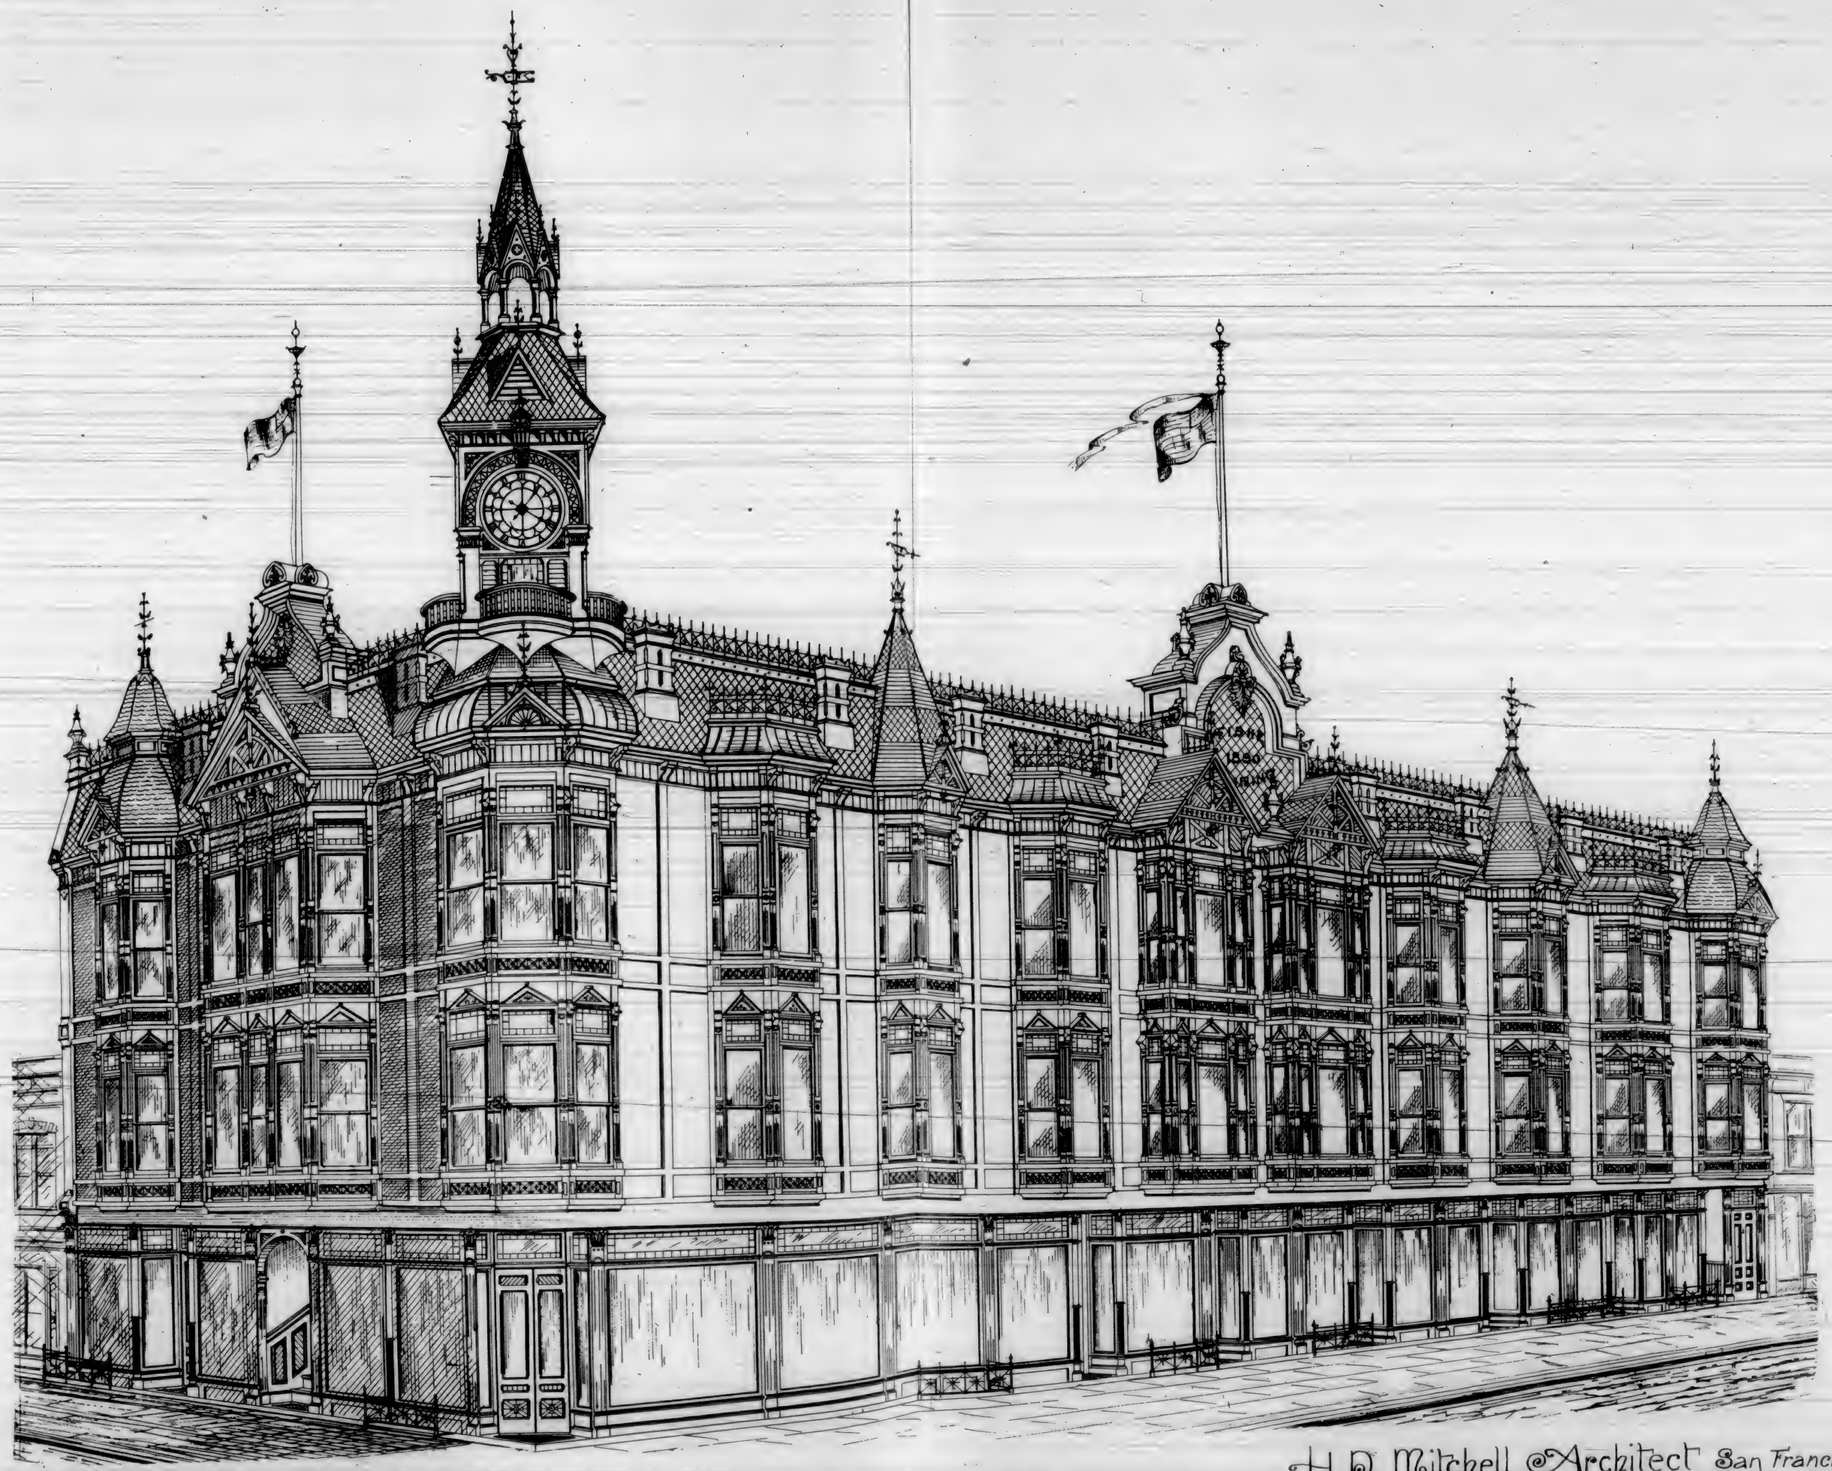
The two main staircases and the interior finish, are of hard wood; the janitors' quarters, lavatories, etc., being finished in cedar and prima vera.

The hardware throughout is of the latest designs in oxidized iron and bronze.

The mantels are all of native California woods, and were made from special designs by the architect. English encaustic tiling form the hearths.

All the latest modern conveniences, such as sliding blinds, electric gas lighting and bell work, polished plate glass, etc., have been liberally supplied. The exterior walls are finished with pressed brick and terra cotta trimmings, with cornices and bay windows of galvanized iron.

The roof of the main building is terraced, and forms a promenade that will be enjoyed during the summer as a delightful retreat from the dust and heat in the streets below.



The Fiske Building Fresno, Cal.

ESTIMATES AND ESTIMATING.

In the course of preparation of every set of drawings that are to be executed, a stage is reached where it becomes necessary to receive from contractors estimates of cost. In no part of the work undertaken by an architect is there so much misunderstanding, confusion, and mystery as in the matter of obtaining estimates. A would-be client approaches an architect, states his wants, outlines his own plans and explains himself in the fullest manner of which he is capable; as every architect is aware, such first ideas are apt to be hazy and nebulous. Finally a plan is evolved, and then the question of cost is considered. Without a moment's preparation, an architect is expected to state within a small margin how much such a plan will cost. Here is where the first misapprehension comes in. Of all the difficult things to decide about a new building, the question of cost is the most uncertain. For this condition there are many things to be considered.

First, very few builders will take up a set of plans and conscientiously figure out the quantities and foot up the items one by one, indifferent to the total until the summing up. It is admitted that the quantity of material to be used within a narrow margin is a fixed unit for the plan given; the uncertainty is in the amount of labor involved in the execution.

Second, few builders have taken the time and the study required to prepare complete sets of time cards, and consequently the element of the amount of labor involved is an unknowable factor.

Third, many builders figure by analogy on the last job which they have done, if it be similar in character to the new one which is proposed. This method is purely a chance one; it contains nothing of a reliable character as a basis of comparison, owing again to the uncertainty as to labor.

Again, many builders figure by the cubic contents of the proposed new building, allowing a certain margin for waste. This method needs a vast amount of data, carefully arranged and classified as to character and finish, as to time employed in erection, and prices of labor during periods of construction, to make it applicable with any degree of security to new work. This method is that which is pursued mostly by architects themselves, and there are some men in the profession who have spent years in acquiring data which can be used for such purposes.

Another method has been proposed, and that is to endeavor to classify every portion of a house in such a manner that a price per square inch, or square foot, or foot run may be obtained. This method involves, as all other methods, the amount of average time employed to do any given piece of work. For example, how few men are there who could from reliable data furnish the cost of a square foot of ordinary stained pine wainscotting, plainly furnished, without a foot of running mouldings, the same with mouldings, the same with various kinds of finish, etc.? But all this, and in fact everything that goes into the house, could be ciphered down with a very small amount of mathematical labor if it were known just how much time it occupied to make, set and finish such and such a piece of work. It is true there is some margin of difference as to the amount of time required to any given piece of work. The average of that time is what is wanted. There must be a summary of this kind for information prepared for American work, before any order or system shall be evolved from the present confused state of estimating. Builders themselves need this kind of knowledge more than anybody else, and next to them, the architects.—*Architecture and Building.*

ELASTICITY AND STRENGTH OF WOOD.

The hardwoods of which frame work and carriage parts are made, possess different qualities. A piece of ash one inch square, one foot long, secured at one end, will break under a weight, attached to the other end, of 168 pounds, while a piece of hickory of same size and under same conditions, will break under a weight of 250 pounds. The ash, however, will deflect but two and five-tenths inches, while the hickory will deflect eight inches, making the value for general use nearly equal, say 55 pounds, of ash and hickory, that being what each will support without deflecting enough to prevent straightening when the weight is removed. Locust breaks at 295 pounds, but resists deflection up to 80 pounds. Maple breaks at 202, but resists deflection up to 65 pounds. White oak breaks under 230 pounds, but deflects at 50 pounds. Elm breaks at 140. and and deflects at 40 pounds, and yet it is next to hickory and maple in resistance to crushing weight on end. These facts, the results of scientific tests, teach a practical lesson that should be heeded by every wood-worker. They teach that where elasticity is desirable, then the woods that will deflect the most without breaking are the most valuable; but where great strength and rigidity are required, then the woods that are the slowest to deflect, even though they will break under less pressure, are the best.—*The Wood-worker.*

THE POTTER, BY M. F. ERHMANN.

THE ORIGIN OF GRANITE.

GEO. F. HARRIS, F. G. S.

Possibly no geologist could be more anxious to account for the origin of granite than are many of the quarrymen and masons who blast and work the material. They always listen with the greatest attention to anything that may be said on the subject, and most of them have their own ideas respecting it. Several of them are quite prepared to believe that granite is of igneous origin, but the majority do not clearly understand the fact from which such a conclusion is drawn. A certain section believes that the long feldspar crystals are the remains of fossils; whilst another is of opinion that granites are as regularly stratified as the aqueous deposits are. All of them know of the existence of other rocks than granite, perhaps, in their immediate

vicinity; but the relations existing between the granite and those rocks very few people seem to recognize.

When the various points are carefully considered, we think that there cannot be the slightest doubt that the evidence is overwhelming in favor of the view that the greater part of granites were once in a molten condition. Taking that afforded by the veins, it is quite clear that the granitic matter must in the majority of cases have existed in a highly plastic condition. From the thoroughly crystalline state of the material and from the fact that when examined by the microscope many of the crystals contain fluids which could not have been formed unless under the influence of great pressure we are led to the conclusion that all such highly crystalline rocks have been formed at a considerable depth from the surface of the earth, that being the only place where such enormous pressure could have been exerted. Now, everybody knows that moving pressure causes heat, and the enormous pressure exerted by the overlying rocks, side-tresses and thrusts in mountain regions, would therefore result in tremendous heat at no very great depth within certain parts of the earth's crust. This heat would be sufficient to melt any known rock, and that it actually does melt is proved by the gradual alternation by heat exemplified in many of the rocks, the upper portions of which have been denuded or worn away and which are thus bared and raised to the surface for our examination. These rocks, as we have before stated, are known as metamorphic, and it has been demonstrated that there is a very gradual passage from certain of them through gneiss to granite; and we must therefore conclude that granite, in the vast majority of cases, is the result of extreme metamorphism by heat, and that it has therefore been, once at least, in a molten condition.

We will pause for a moment to consider the meaning of the words "Molten condition." Although we have stated that at certain depths within the crust of the earth the heat resulting from moving pressure exerted by superincumbent rocks would be sufficient to melt any known rock, we should have added, if this rock existed at the surface of the earth.

Now, we have shown that the metamorphism and ultimate fusion of rocks was dependent upon the condition that they existed not at the surface of the earth, but at some distance within the earth's crust. Therefore we have no right to assume that rocks would actually melt when not situated at the surface. But the only thing which prevents them from becoming liquid is the weight of the superincumbent mass of rocks; in other words, the principal thing which caused them, in most cases, to become highly heated is the very same agent which deters them from becoming liquid. We therefore are led to see that rocks can exist in a highly heated condition in a solid form, and even when they, under the ordinary conditions prevailing at the earth's surface, would melt.

Such rocks are described by Professor Judd, F. R. S., who clearly explains this point, as being in a potentially liquid condition. If by reason of earthquake action or othewise, this superincumbent pressure be suddenly released, the potentially liquid mass would fly to the actual liquid form, and would burst through the rocks immediately above it, sending veins branching in every direction. Perchance some of these veins, bursting along the lines of least resistence, would reach the surface of the earth, and we should then get a volcano. The same acute observer mentioned above has demonstrated that the acid lavas (those which have a large portion of silica in them), when traced downwards, will be found to have proceeded from granite and granite rocks. The lavas under consideration are very frequently of identical chemical composition with the granites, and the only difference between them is their respective minerals and states of crystallization. The granites, as we have before mentioned, are thoroughly crystalline; there is no glassylooking cementing material binding the crystals together, but the lavas, on the contrary, contain a very large proportion of this glassy cement, and are not, therefore, thoroughly crystalline in structure.

Further, Professor Judd and other geologists have shown that the amount of glassy material present in an igneous rock is in inverse proportion to the amount of pressure under which it consolidated. For example, if it consolidated at the surface of the earth (and so under very little pressure) it would cool quickly, and there would be a greater proportion of glassy matter between its crystals than if it consolidated more slowly some distance down the throat of the volcano, and there would be still less of the material as the granite was approached. The glassy groundmass would gradually assume a crystalline structure, and would pass from cryptocrystalline through microcrystalline to thoroughly crystalline, or granite state of crystallization.

We have now shown that a rock which is indubitably in a molten condition, inasmuch as it is found exuding in that state from a modern volcano, can be traced downwards to granite. What greater proof of the once molten condition of the granite is needed? Surely the evidence is overwhelming enough to convince the greatest skeptic on the point. Of course nobody has actually descended the neck of a volcano to ascertain these things. It is all worked out by observation on denuded volcanoes, which have long since ceased to emit lavas, being now extinct; on the phenomena exhibited by the veins of granite, and on the invariable alteration of the rocks surrounding the granite. Denudation, or the action of the atmosphere, etc., in weathering or wearing down rocks, has been the greatest assistant in enabling us to solve the problem. There is no rock in existence which successfully resists the denuding agents for any great length of time. Our building stones are weathered, no matter how well they may be selected. Even granite itself, hard though it may be, is worn away in time; and nobody would pretend to dispute this fact who has seen the many feet in depth of rotten granite which exists at the surface in many granite districts.

We would desire to be clear in connecting acid lavas with granites. Having seen that in time all rocks may be disintegrated, we can trace by means of a volcano, dissected in this way by the weather, the rocks from the crater downwards. We may find in one region the lava of the crater and a small portion of the neck of the ancient volcano leading down from it. We carefully collect specimens of the rock from the crater and the different levels in the neck, and if the section be sufficiently large, we shall observe that the rock at the lower levels of the neck is slightly more crystalline in character than the lava in the old crater. Then we go on to another section, it may be in another district, and succeed in discovering a rock exactly like the more crystalline form from the lower portion of the volcanic neck. Tracing this rock downwards, we find that as we get to its lower part it gets indubitably more and more crystalline. Another section may, perhaps, present us with the more crystalline rock last alluded to and on following this up we find that it leads us to a granite vein, maybe one of the elvans, and so on to the main mass of the granite. The connection of the lava with the granite would thus be proved.

We see, therefore, that although there is plenty of granite now at the surface of the earth, it once existed a few thousand feet below, and it has been brought to the position in which we now find it, partly by the wearing away of the rocks which were above it, and partly by the irruptive nature of the material itself when in the molten condition. Such operations would take thousands of years to carry into effect, but then geologic time is practically infinite. Reverting to the order of sequence of the aqueous rocks, we may mention that, taking the whole world, exceedingly few granites are of Tertiary age, and even these are confined to the earlier periods of it; the majority are of Primary (or Paleozoic) age, or Archaean. This is just as it should be, for of course the longer the rocks have been in existence the greater chance they have had of being largely denuded. Granites are being formed below us at the present time, but it will be in the exceedingly remote future before the rocks overlying them will be worn down, and they will thus be brought to the light of day. Granite would not be formed at such great depth from the surface of the earth in mountainous regions as in the less corrugated portions of the crust, for the enormous lateral pressure exerted in the formation of the mountain ranges would raise the temperature sufficiently to melt rocks comparatively nearer the surface. This is how it is that granites so frequently occur along the lines of very much denuded ancient mountain chains.

It was not so very long ago that geologists universally believed that all granites were older than any of the aqueous rocks, but it is now proved, as we have stated, that they may be of any age, except the most recent geologic periods. At the same time the granites of several areas are unquestionably among the oldest rocks in existence, and in many such cases it is exceedingly doubtful whether they are the products of extreme metamorphism caused in the way we have attempted to explain, or simply the cooling, at great depths, of portions of the original molten crust of the earth.

STONE.

NOTES & COMMENTS.

Santa Rosa is to have an improvement society.

A brick-yard is talked of at Sebastopol this season.

The entire expenditure for the Forth Bridge foot up about sixteen and a quarter million dollars.

A building syndicate and trust company is projected in Philadelphia for the purpose of carrying on large building interests.

The city and county attorney reports to the Board of Supervisors that in his opinion, the city will be responsible for damage to private property resulting from raising or lowering the grade of its streets.

Every architect who has charge of important constructions, should have photographs of the work taken at frequent intervals. They will serve a variety of useful purposes, besides forming an interesting record of the execution of the work.

San Diego has 39 miles of graded streets, 22 miles of street railroad, 58 miles of motor railway extending to the suberbs in every direction, 47 miles of sewer system, and a complete system of water works. It is now proposed to build a seawall for the water front.

For interior plumbers work which may be exposed, brass pipes and fittings should be substituted for lead or iron. A kitchen fitted with exposed polished brass or plated pipes forms a beautiful effect. Iron pipes treated by the Bower-Barff process would be suitable for such work.

The iron railing and fence now surrounding the Plaza, on Kearny street, is to be removed according to an order passed by the Board of Supervisors, March 31st. This work was done some thirty-six years ago, when labor and materials were high, as may be seen from the fact that the cost was $45,000.

A dispatch from New York, states that a hole has been accidently burned through the roof of the caisson of the hugh North River Tunnel and caused the flooding of the tunnel. Engines are unable to expel the water. The accident reaches the magnitude of a disaster, and it appears that a new start will have to be made from the New York end, which would cause the loss of the work of years.

We think that building in cities, with a few exceptions, are built too light. * * * * European cities, * * * do not suffer by fire to any extent. This is due to heavier and better constructed buildings, that are preserved and carried out substantially over the whole of the closely built parts, and fires, when they occur, are always localized, even with the comparatively inefficient fire departments common in the best cities in Europe.—*Stone.*

At a recent meeting of the Fire Committee of the Board of Supervisors, it was decided to report in favor of changing the ordinance governing fire escapes, so that in every building erected hereafter four or more stories in height, there shall be metallic ladders or fire escapes with balconies and railing to extend in front of and communicating with one window in each story, extending from the first story to the upper stories and four feet above the roof.

It is probable that the Grant Monument Committe of New York will arrange for another competition in hopes of obtaining a design more satisfactory than any submitted in the first competition. If they should decide to institute another competition, it is to be hoped they will take professional advice in framing the invitation, and make the terms such that men of established reputation will be willing to devote their time to producing a creditable design.

A farmer read in an agricultural journal: "A side window in a stable makes a horse's eyes weak on that side; a window in front hurts his eyes by the glare; a window behind him makes him squint-eyed; a window on a diagonal line makes him shy when he travels, and a stable without windows makes him blind." The farmer has written to the editor of the agricultural paper, asking what effect a window without a stable would have on his horse's eyes.—*N. Y. Ledger.*

In our last issue we published several articles and portions of articles, taken from our exchanges, and by oversight neglected to give the proper credit to which they were entitled. We will consider it a favor if each subscriber will make the necessary corrections in the March number under the uncredited articles as follows:—

The article under the heading of "The Machinery Hall, Paris Exhibition," was an extract from a paper contributed to the *Journal of Proceedings of The Royal Institute of British Architects*, by Henry Reilly, Assoc. M. Inst. C. E. For "St. Louis City Hall Competition" we are indebted to the *Building Trades Journal*, of that city.

It is reported that the statue of liberty on Bedloe's Island, in New York Bay, is slowly sinking. The fact has been suspected for some time past, and an examination recently made by practical engineers, confirms the belief and shows that the statue is lower than when erected.

Though Bedloe's Island is rock and was supposed to be as firm a foundation as could be obtained, it now appears that it was the extreme edge of an enormous shelf, underneath which is a bed of quicksand. The immense weight of the solid stone and concrete pedestal undoubtedly broke off the portion of the rock on which it rests, and it is now thought to be slowly but surely settling out of sight.

The monument to the memory of James W. Marshall, the first discoverer of gold in California, will be unveiled within the course of a month. The monument was erected by the State, at a cost of five thousand dollars, and will be placed in the lot where the body of Mr. Marshall is interred. This memorial consists of a bronze statute, eleven feet in height, resting on a granite base thirty feet high. The commissioners who have charge of the matter, desire the ceremonies on the occasion to be memorable, and have invited all the societies of the Pioneers of California, and the Grand and Subordinate Parlors of the Native Sons of the Golden West, to be present in a body or send delegates to suitably represent them.

The Master House Painters' and Decorators' Association of the United States recently held a convention at Detroit, Michigan, and adopted the following resolutions:—

Whereas, The fact that architects do not usually specify the sizes of glass is a source of much inconvenience and loss to master painters.

Resolved, That the Master House Painters' and Decorators' Association of the United States of America, in convention assembled, do earnestly and respectfully request architects in future to specify the sizes of glass, and that the secretary be requested to forward a copy of this resolution under the seal of the Association to the American Institute of Architects.

There are many little points of difference in the customs of architects and builders in the Eastern States and those on this Coast. The above resolution illustrates one of them. In the Eastern States it is customary to have the glazing done by the painter; here it is usually sub-let by the contractor, to some one making a specialty of glazing, consequently it would be of no particular benefit to the painter to have the sizes of glass specified. The sizes of the sashes are marked however, and also the number of panes to each sash, so the contractor is enabled to ascertain the amount of glass required.—[Ed. California Architect.]

Architecture and Building for March continues its articles on architectural design, by Prof. A. D. F. Hamlin; also a paper by Francis Osbourne on "A Course of Reading in Architecture," and a paper on "Architectural Effect in Cities," read before the Art Congress at Edinburgh by Mr. H. H. Statham.

There is an excellent article in *The Architect and Contractor* on "Office Management and Routine," by R. W. Gambier Bonsfield.

The Northwestern Architect and Improvement Record for March publishes the second Royal Academy Lecture of this season on "Roman Architecture," by Prof. George Aithchinson, A. R. A.

Volume I, Number I of *The Architectural and Building Monthly*, is the first issue of a new monthly published by A. J. Bicknell, New York.

The National Builder for April continues the articles on *Mortars and Concretes of Antiquity and Modern Times, and on The Art of Drawing.*

The Inland Architect for March contains plans and descriptions of some of the competition designs for the St. Louis City Hall, and some editorial remarks on competitions in general and this one in particular.

A correspondent write us for information as to where certain court decisions can be found bearing on the legal responsibility of parties inviting architects to furnish competition plans for buildings, the erection of which had not been fully determined upon, or the erection of which might be finally abandoned. If any of our readers can give the desired information such will be received with thanks.—*Ed. California Architect.*

CITY BUILDING NEWS.

Ashbury and Frederick. Frame building and stable; owner, P. A. McDonald; architect, E. Depierre; contractor, John O'Brien; cost, $8,500; signed, April 2, filed, April 4; payments, 75 per cent. of value of work done; balance, 35 days.

Bush and Jones. Four-story building; owners, J. Flinn and wife; architect, D. De Shutt; contractor, W. Langstaff; cost, $13,000; time, 120 days; signed, March 26; filed, March 27; payments, $4,000, first tier of joists are set; $2,000, framed; $3,100, brown coated; $1,650, outside finish on; $2,000, completed; $3,250.

Broderick and Washington. Two-story frame; owner, W. A. Shaw; architect, A. J. Barnett; contractor, J. A. Shepherd; cost, $4,500; signed, March 26; filed, March 27; payments, $1,000, enclosed; $1,000, brown coated; $500, white coated; $1,000, completed; $1,000, 35 days.

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute Architects, meets second Friday of each month at 408 California Street.
Seth Babson, Pres. W. P. Moore, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at 408 California Street.
John Richards, Pres. Prof. Frank Soulé, Vice-Pres.
Otto Von Geldern, Sec. Jas. Spiers, Treas.

THE regular monthly meeting of the San Francisco Chapter of the American Institute of Architects was held in their rooms Friday evening, May 9th.

Architect M. G. Bugbee was elected to fellow membership. Architect Frank Shea made application to become a fellow member. The application took the usual course and was referred to the Investigating Committee.

The report of the Committee on revision of Constitution and By-laws, to bring them into harmony with the Institute, was laid before the meeting, and the proposed changes discussed at length. Action will be taken at a future meeting.

The report of the Committee appointed at the last meeting to prepare a suitable defense of the action of the Chapter in accepting the invitation of the City Hall Commissioners to investigate and report on the proposed New City Hall tower, was presented to the Chapter, unanimously adopted and the Secretary ordered to send the same to the Secretary of the American Institute.

The Committee named to decide on the Order of Merit of the drawings submitted in the last monthly competition of the A. I. A. Sketch Club reported that the honor of first mention was given to S. C. Benson, second mention to C. A. Meussdorffer and third mention to Frank Holland. The drawings in the May competition on the subject of a country stable, were inspected by the members present, and the same Committee continued to pass on the respective merits of the drawings submitted. Mr. Sanders, the teacher of the Chapter's class in design, reports that an increased interest is being taken in the work by members of the class, and desires to call the attention of all students in Architects' offices, and extend a cordial invitation to them to join the class.

The class is open to any student in the office of any member of the Chapter, and any further information will be given upon application to Mr. Sanders or to the Secretary of the Chapter.

THE LABOR QUESTION.

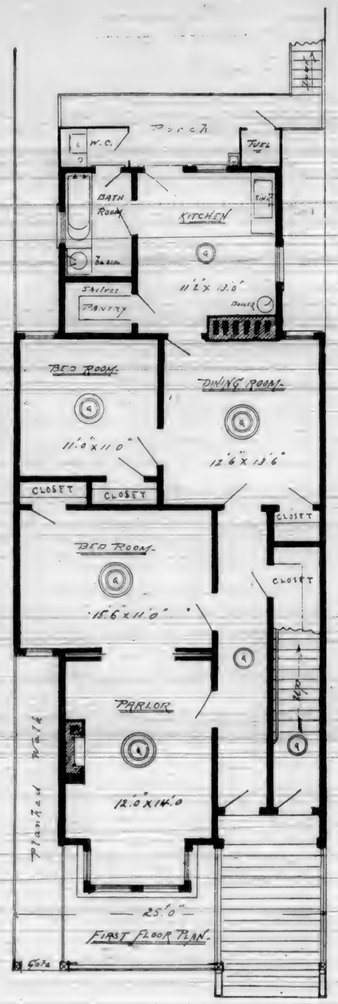
ON the all absorbing labor topic of the day the *The Canadian Architect* has the following:—A solution of the problems in connection with the adjustment of wages must be recognized as being as difficult as those pertaining to the science of political economy, and a solution which every one will accept as correct and satisfactory may be considered to be well nigh impossible, but some plan for the avoidance of these periodical convulsions in our industrial life we believe must and will be found, however slow its development may be. What we would propose and appeal most earnestly to every man to strive for, is some arrangement of the present difficulties that will set and keep the wheels and machinery moving until the happy condition shall have been brought about when these disputes will be a thing of the past. To that end, and as meeting the immediate necessities of the case we would suggest for the consideration of labor union men,

master builders and every business man in Toronto, that a committee be appointed, to sit as a Board of Arbitration between the building trades and the employers for the city of Toronto, this committee to settle the present difficulty and decide what shall be the standard of wages for the years 1890 and 1891 and the same committee to remain organized for two years and readjust the scale of wages for the years 1892 and 1893 reporting its decision of the same to the Trades' Union and Master Builders' Association on or before January 1, 1892, the same course to be pursued biennially thereafter. The membership of this Board of Arbitration should be one delegate from each branch of the building trades and one from the Building Laborers' Union, one delegate from each branch of the Master Builders' Association, and an equal number of architects, to be delegated by the Ontario Association of Architects, making in all about 25 members. Let this board establish its own rules of procedure, except that the vote of a majority of all its members should decide any question under consideration. After settlement of the questions now in dispute, they would be prepared to receive information or complaints tending to furnish light needed for the next biennial regulation of prices. After that, a new selection of delegates could be made every two years. We believe that the Trades Unions, Master Builders and public generally could and would have confidence in such a body, and that it could be made successful not only as a regulator of wage rates, but could also be made a sort of Court of Appeal for the settlement of any differences now usually ending in a strike. The trades and masters would be evenly balanced and no doubt prepared to protect their respective interests, and the position of mediators would devolve upon the architects. We feel sure that the Master Builders would be satisfied to place themselves in the hands of such a Board and we can see no reason why the Trades Unions should not have all necessary confidence in its fairness and intelligence.

Contractors are constantly placing themselves in the hands of architects in a way that involves large interests, and they know that every true architect will endeavor to see that they as well as the proprietor, get fair play. Surely the workmen ought to be ready to have as much confidence as their employers in the reasonableness of the architects. This is one of several apparently feasible plans, which might be suggested for the adjustment of such disputes. For instance, three Superior Court judges might constitute a Board of Arbitration to whom each party to the dispute would state their case and in accordance with whose ruling on all the points submitted, the difficulty would be settled.—*The Canadian Architect and Builder.*

THE SITUATION.

NEARLY every city in the country is in a state of ferment regarding the eight hour question. Particularly is this true of trades connected with building. The labor organizations, so far as can be perceived, have no very well defined plan of operations. The result of the conference of the Executive Council of the American Federation of Labor, held in New York on March 18th, must be rather disappointing to the various trades which expected the central organizations to manage the details of the fight. According to the telegraph report, this burden has been placed upon the local societies in the various cities, and with them is left the privilege to do as they please regarding the subject of hours and wages. We believe this decision will be fatal to the success of the eight hour movement, as employers are not liable to make any concessions while their competitors in other cities continue to do business under the old conditions. Perhaps in some trades a temporary local advantage will be gained, but unless the change becomes general, the laws governing trade will soon enforce an observance of the old standard.—*Building Trade Journal.*



Plan for flats. H. T. Bestor, Architect.

MONEY STIPULATIONS IN CONTRACTS.

AT THE present time there is considerable discussion among architects and builders as to the proper method of providing stipulated amounts in contracts for various purposes.

For example, plumbers are urging architects, wherever opportunity offers, of wording a specification in such a manner that certain fixtures shall not cost less than a certain specified amount, after naming general typical features that are recognized as desirable in goods of the same class.

This is a very convenient method of procrastination, and the too-busy architect sometimes succumbs to the temptation of being indefinite. For to be definite is to be particular and signifies thought and selection, and both require an expenditure of time which is not always available.

The stipulation clause is generally put in itself with wide possibilities as to construction, and the wider the door is left open for differences of opinion, the greater are the difficulties which surround the practice. Some clauses call for so much hardware to cost such a sum; this may seem definite enough at first sight, but in reality it is often wide of the architects' intentions. It may be his intentions are that the cost named shall be the net cost to the contractor, the latter on the other hand maintaining that, as he is obliged to handle the goods and make the purchases and invest his capital for the benefit of the owner, he should, therefore, be reimbursed for his trouble. It may be just in many cases that he should receive some compensation for such a service, but the whole difficulty of the matter is in the lack, in the first place, of a proper understanding of each other's position. The specification should either say net cost to the builder, or wholesale price, or list price less trade discount, or so much profit allowance to the builder, the latter can adjust his bid to the conditions proposed. To leave the matter until it is time to settle up, is, to say the least, gross carelessness on the architect's part, and stupidity on that of the builder.—*Architecture and Building.*

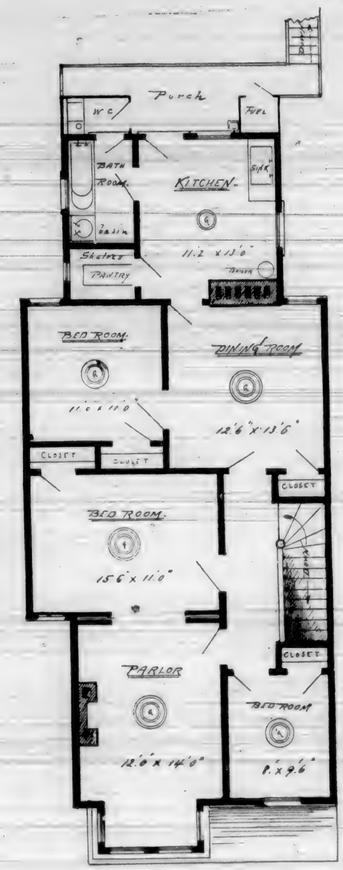
THE VENTILATION OF SCHOOLS.

IN November last, Professor Carnelley (professor of chemistry, Aberdeen University) delivered an address under the auspices of the Aberdeen branch of the Educational Institute on "The Sanitary Condition of Our Schools." Professor Pirie presided, and there was a large attendance. Professor Carnelley spoke more particularly of the air of schools. After showing how important good air was to health, he went on to speak of the great necessity there was for improvement in this direction, in so far as schools are concerned. He referred with satisfaction to the position Aberdeen occupied in having, in proportion to population, introduced the mechanical system of ventilation in more schools than any other town in the country. Aberdeen had introduced the system in four schools; and in the whole of England and Scotland there were only seventeen schools ventilated. In almost all schools the cubic space was far too little, and ventilation was deficient. It was necessary that ample cubic space should be provided, because if the space were small, the amount of ventilation that would be required would have the effect of creating draughts, which might be more injurious than impure air. The older the school was the more micro-organisms there were; and the younger children, the less carbolic acid and the more germs. Boys made the air of the school much more impure than the girls.

As to what to do to render the air better, he said he had visited, eighteen months ago, 150 schools with 110,000 scholars, and had received details regarding 173 other schools with 165,000 scholars, and he had come to the conclusion that mechanical ventilation should be adapted in all new schools.

It gave much greater purity to the air, and it was much more independent of the weather than any other means of ventilation. There was a more equal distribution of the hot and the fresh air. Mechanical ventilation was very effective in diminishing the micro-organisms, and it reduced the draughts to a minimum. It was far more conducive to health and comfort, and it was a factor in increasing the power of teaching and learning. The cost of such a system in a school for 1,000 scholars was £40 per annum.

At the close Professor Carnelley was cordially thanked for his address.—*The Builder.*



Plan for flats. H. T. Bestor.

The following statistics are taken from the *San Francisco Journal of Commerce*. The Real Estate sales in San Francisco for the past four years have been as follows:

1889	6,736	sales	$32,768,969 00
1888	5,356	sales	24,744,479 00
1887	4,998	sales	20,745,079 00
1886	3,101	sales	15,119,760 00

The year 1889 shows more than double the year 1886.

During the year 1889 the new vessels built on the Pacific Coast and registered at the port of San Francisco was 7,144 net tonnage.

The lumber receipts at the port of San Francisco for the three preceding years was, in feet, board measure:

	1889.	1888.	1887.
Pine	301,894,864	268,286,418	209,908,981
Redwood	161,258,329	138,235,710	118,693,590
Shingles, M.	113,375,200	144,336,900	59,689,702

Receipts for California Lime for 1889 have been 129,463 bbls.

A NEW WHITE HOUSE.

The Committee on Public Buildings and Grounds of the Senate have been invited to visit the Executive Mansion to examine its condition with a view to repairs and to enable Mrs. Harrison to state her ideas with reference to the extension of the building. The theory of Mrs. Harrison's design, which has been carried out in the plans which an architect of this city has made under her direction, is the preservation of the original building intact, the addition on the east and west respectively of counterparts of the original structure in general architectural style, their connection with the main edifice by a colonade range, and the extension on the south of a wide conservatory or winter garden, with a central rotunda or palm house, the entire series of structures forming the four sides of an inner park. The original building is to be devoted exclusively to the uses of an Executive residence. On the west is the official wing, approached from the Departments of State, War and Navy, and arranged on the floor with a diplomatic audience room and anterooms for guests at receptions. The connecting range or statuary hall forms the way to the main building, where the President and wife receive. The second floor of this wing contains the office of the President, the Executive library and cabinet, the private secretary's and clerks' rooms. From the main building toward the east another broad passage similar to that on the west opens into the public wing, containing the gallery of paintings and treasures of art and history. This wing will be open to visitors. The conservatories on the south form not only a scene of tropical beauty in winter, when social gayeties are at their height, but a grand promenade back to the entrance and to the anterooms, thus obviating the crowding which occurs in great throngs of people.

The outer measurement of this architectural rectangle of edifices is 427 feet from east to west, and 350 feet from north to south. The inner court or park, 250 feet square, is to be turfed and arranged in parterres, with a grand allegorical fountain in the center, commemorating the discovery of America in 1492, the laying of the corner stone of the Executive Mansion in 1792, and the triumph of free institutions in 1892. The fountain will represent the landing of Columbus and his officers on the October morning of 1492 from the Santa Maria, Pinta and Nina, with the island of Guanahani in the distance. Subsidiary figures will represent the different ages of exploration, colonization, independence and national progress. This piece would not only be an effective feature in the artistic entirety of the Executive residence, but would serve as a memorial of Columbus's discovery of the New World and the laying of the corner stone of the official home of the Presidents of the American Republic, the former on October 12, 1492, and the latter on October 13, 1792. The fountain would have attachments of light and colors by night.

The advantage of this comprehensive plan is a symmetrical addition to the building. The construction of the conservatories on the south admits sunshine, winter warmth and summer breezes into each of the buildings without obstruction. The view from the windows is also unbroken. The court affords private grounds for the President's family, and on a certain day of the week may be thrown open to the public, with music and the fountains playing. The cost is estimated at $700,000, with such additional expenditures as may be allowed for elaboration of details, erection of terraces and embellishment of the grounds. The staircases would be of marble, with onyx trimmings. The connecting galleries are set apart for statuary halls, with statues of Lincoln and Grant as central figures. The rotundas of the stair halls of the wings are arranged for statues of Washington and Jackson. The entire additions might be completed by October, 1892, as a commemoration of the discovery of America and laying of the corner stone of the original mansion, thus constituting a suitable memorial of those historic events at the national capital.—*Architecture and Building.*

WHICH PART OF THE TREE IS STRONGEST?

"It is by no means rare," says the proprietor of a large physical laboratory for builders and prospective owners of buildings, "to have joists, plates, sills and other important pieces tested, in order that the size and kind for prospective uses may be determined." Why not? Is it not of much greater importance that the strength of materials entering into the construction of factory, store or dwelling be as accurately determined and well known as those out of which cars, bridges, and crossties are built? Proprietors of extensive car works, railroad and construction companies have the strength of materials known before a blow is struck, by which means enough and no more is used to sustain the strains to which the materials are to be subjected; but an architect and builder who makes a specialty of such knowledge, is extremely difficult to find in this, and, we presume, in any other city on the American continent.

This leads to the question, strength considered, of the relative merits of certain portions of a tree. It might be supposed, inasmuch as every layer from the central pith to the bark is in a different stage of perfection, the innermost or earliest formed being the most matured, would naturally be the strongest; but practical tests, made on the most modern and accurate testing machines, demonstrate that this is only true up to a certain period of growth. The greatest strength and toughness lies near the most recently formed heartwood, or that part the nearest to the sapwood. For this reason alone, to say nothing of many other peculiarities that will be enumerated at another time, it becomes a matter of the greatest importance in the selection of timber or lumber for special purposes, requiring great strength and toughness, to have as little sapwood as possible, and as little pitch.

With practical tests already made, this leads to the conclusion that timber or lumber for these special purposes, where the above properties are required, should be cut as near the sapwood as the timber will allow, for it should be remembered that the tree does not cease growing when it comes to maturity. As long as the tree is alive it continues to increase in bulk by the addition of the annual layer, but when maturity is once passed, each succeeding year produces a certain degree of deterioration. This decay appears in various stages, and generally exhibits in the first instance, either a white or a yellowish color at the butt or root end of the stem. If white, the decay is often very slight, and does not appear more than a few feet up at most, but if a yellowish red in color, it is not infrequently of a most serious character. Again, if the affected parts have assumed a decidedly red tinge, the tree is said to be foxy, and scarcely fit for any purpose, as the decay will be found to permeate a greater portion of the entire tree.

A more advanced stage of deterioration is that which may be described as a drying up or wasting away of the wood layers surrounding the pith. This forms a hollow, first at the butt, and then spreads upward, gradually increasing in size as the tree gets older, while this defect may eventually reach into the very branches.

Trees are most valuable as yielding the largest amount of good timber just prior to their reaching maturity, which is indicated by the topmost branches and branchlets becoming stunted and presenting a scraggy appearance. If, therefore, we wish to select a prime, healthy tree for felling, we must select one having an abundance of young shoots, and the topmost branches of which look vigorous, strong, pointed and healthy, this being the most certain evidence that the tree has not exhausted all the vegetable food within reach of its roots; in other words, that the tree has not passed its maturity.

Whenever there is the unmistakable evidences of permanent decay in a tree, the most economical thing to do is to cut it down, convert such parts as will answer the purpose into lumber, and use the balance for such purposes as do not require strength, durability, or staying properties. The size of any tree cannot be taken as a criterion of the tree's maturity by any means, there being unlimited growth if the roots can find food to sustain and extend the formation fabric.—*The Wood-Worker.*

STONE CUT WITH WIRE.

A NEW INVENTION USED IN FRENCH QUARRIES.

A NEW plan of cutting stone by means of wire cord has been adopted in many European quarters, says a writer in *Science.* While retaining sand as the cutting agent, M. Paulin Gay of Marseilles has succeeded in applying it by mechanical means, and as continuously as the sand blast and band saw, with both of which appliances his system—that of the "helicoidal wire cord"—has considerable analogy. An engine puts in motion a continuous wire cord (varying from five to seven thirty-seconds of an inch in diameter, according to the work), composed of three mild steel wires twisted at a certain pitch, that found to give the best results in practice, at a speed of from fifteen to seventeen feet per second, the higher speed being adopted for the smaller diameter.

Elevation of flats. H. T. Bestor, Architect.

POPULAR IGNORANCE ON A COMMON SUBJECT.

SOME twelve or fourteen years ago, one of the editors of this journal was the spectator of a scene on one of the smaller streets, which it was the custom at that time to plank instead of pave.

An excited woman was vigorously berating the contractor for endeavoring to lay some planks in front of her property that were not entirely free from knots. The contractor in vain endeavored to convince her that no fraud was proposed, but the woman insisted on her right to have clear timber.

One of her neighbors, an old country man, after the squabble had subsided, quietly went up to the contractor and privately offered him a small sum to pick out all the planks that showed small knot, and have them laid opposite his sidewalk. Of course the reason was plain:—the knots and the wood surrounding them being much harder would wear a correspondingly longer time, and would not be worn out until the straight grained wood was splintered and destroyed. The result confirmed the old fellow's shrewdness, as the woman had to repair her part of the street long before her more far-sighted neighbor.

DRESSING A STONE.

THE method of dressing a stone has an important bearing upon its durability. As a rule it may be set down that the less jar from heavy pounding the surface is subjected to the better; this for the reason that constant impact of the blows tends to destroy the adhesive or cohesive power of the grains, and thus renders the stone more susceptible to atmospheric influences. It is stated by Mr. Batchen that some of the dolomites used in Chicago, although apparently perfectly sound when quarried, shortly showed a tendency to scale on exposure.

On examination it appears that in dressing these surfaces were both ax and bush—hammered, the implements used weighing from eight to twelve pounds, and capable of striking blows not less than 150 to 200 pounds. The effect of these heavy blows was to "stun" the surfaces for the depth of from one-sixteenth to one-eigth, or even one-fourth of an inch, and on exposure scaling resulted, leaving them ragged and unsightly. Sawn surfaces of the same stone, on the contrary, do not usually show the slightest tendency to scale.

Results such as these are what one is naturally led to expect, but further experiments are necessary before it will answer to speak too positively regarding the merits or demerits of various kinds of finish. With compact crystalline rocks like the granites and diabases it would seem probable that rock-faced work, untouched by chisel or hammer, would prove most durable, since the crystalline facets thus exposed are best fitted to shed moisture and the natural adhesion of the grains has not been disturbed.

With the softer and more absorbent stones on the other hand, the rock surface from its irregularity and roughness is more susceptible to the attacks of moisture and atmospheric acids, and hence would probably be found less durable, although from its roughness at the start any disintegration is less noticeable than on finely-finished work. With such stones a smoothly-sawn or polished surface seems best adapted to our variable climate.—*Stone.*

The management of this journal desires to extend a cordial invitation to all Architects on this Coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

One of our lithographs this month illustrates a ten class school building erected at Eureka, Humboldt county, from the drawings of the architect, Jas. E. Wolfe.

The other double plate shows the elevation of the General Keyes Building on Stockton and O'Farrell streets, in this city. This building, of which a more extended notice appears elsewhere, was designed by architect Chas. Geddes under whose supervision the building was erected.

The plans and elevation of a two-story flat, were designed by H. T. Bestor, architect, and are intended for use on a lot having a frontage of twenty-five feet.

The monument to Paul Baudry in Pere la Chase cemetery, Paris, was designed by architect Ambroise Baudry, his brother, who superintended its erection; the figures were executed by Antonin Mercie, and the bust by Paul Dubois. Paul Baudry stood high in his art. One of the latest and greatest of his works is *la glorification de la loi.*

NOTES & COMMENTS.

Postmaster Bryan has notified the public that he will not collect other than first class matter left at letter boxes.

It is estimated that the Mills Building in New York city, which cost between three and four million dollars, pays him nearly 6 per cent.

Senator Stanford proposes to donate 200 acres of land in the vicinity of the Twin Peaks for use as a public park, provided Market street is extended to reach the locality.

The interior of the St. Ignatius church on Hayes street is to be decorated at an expense of $25,000. Moretti and Trezini are the artists who have the work in charge.

The monument to Marshall, the discoverer of gold in California, was recently unveiled according to programme. The monument was designed and erected by sculptor Marion F. Wells.

D. O. Mills is in the city, and it is rumored thinks of improving his property on the northeast corner of Montgomery and Bush streets, by erecting a nine-story building somewhat similar to Mills Building in New York city.

According to the editor of *Stone* the best pavement for streets upon which there is a heavy traffic, is granite or sandstone; and that for residence streets asphalt is the thing, it being understood that the durability of any good pavement depends on its having a proper foundation.

The Board of Education has selected the Scott street lot for the new Girls' High School, and the Board of Supervisors have approved the selection. Architect T. J. Welsh has been requested to prepare plans for a brick and stone structure containing sixteen class rooms and an assembly room.

The Carpenters' Union held a very successful and enjoyable picnic on May 1st. The boats were crowded with the men and their friends, who enjoyed thoroughly the unusual holiday which broke so pleasantly the monotony of their daily toils. The various games were well contested, and many valuable and useful prizes were distributed to the successful competitors.

A handsome building has been erected near the Trocadero Palace, in Paris, for the reception of a collection of idols and other objects of worship procured and arranged by M. Guimet. Here will be exhibited divinities worshiped by the inhabitants of the pagan and uncivilized countries of the world from the early ages down to the present time. A curious collection they will be, and an interesting study as well.

The Illinois Chapter A. I. A., has assumed the control of the permanent exhibit of building materials. The enterprise was established some five years ago at Chicago, by H. L. Gay, who has conducted it since. The task assumed by the Illinois Chapter is one of no small magnitude, and is a departure from established precedents which may give rise to unfavorable criticism. We wish the enterprise may be as successful as its warmest advocates can expect.

On the 17th of April Judge Hoge gave judgment for the defendants in the case of Calvin Brown, C. E., against the City and County of San Francisco; Mr. Brown desired to collect for services rendered in investigating and reporting on the proposed new tower for the City Hall. The defense was that the services had been requested and rendered on the assumption that Mr. Brown as a public spirited citizen would be pleased to render such services gratuitously. The Judge took that view of the case in spite of Mr. Brown's assertions to the contrary.

PERSONAL.

Architect G. W. Percy is in the East on a trip combining business and pleasure.

Monument to Paul Baudry.

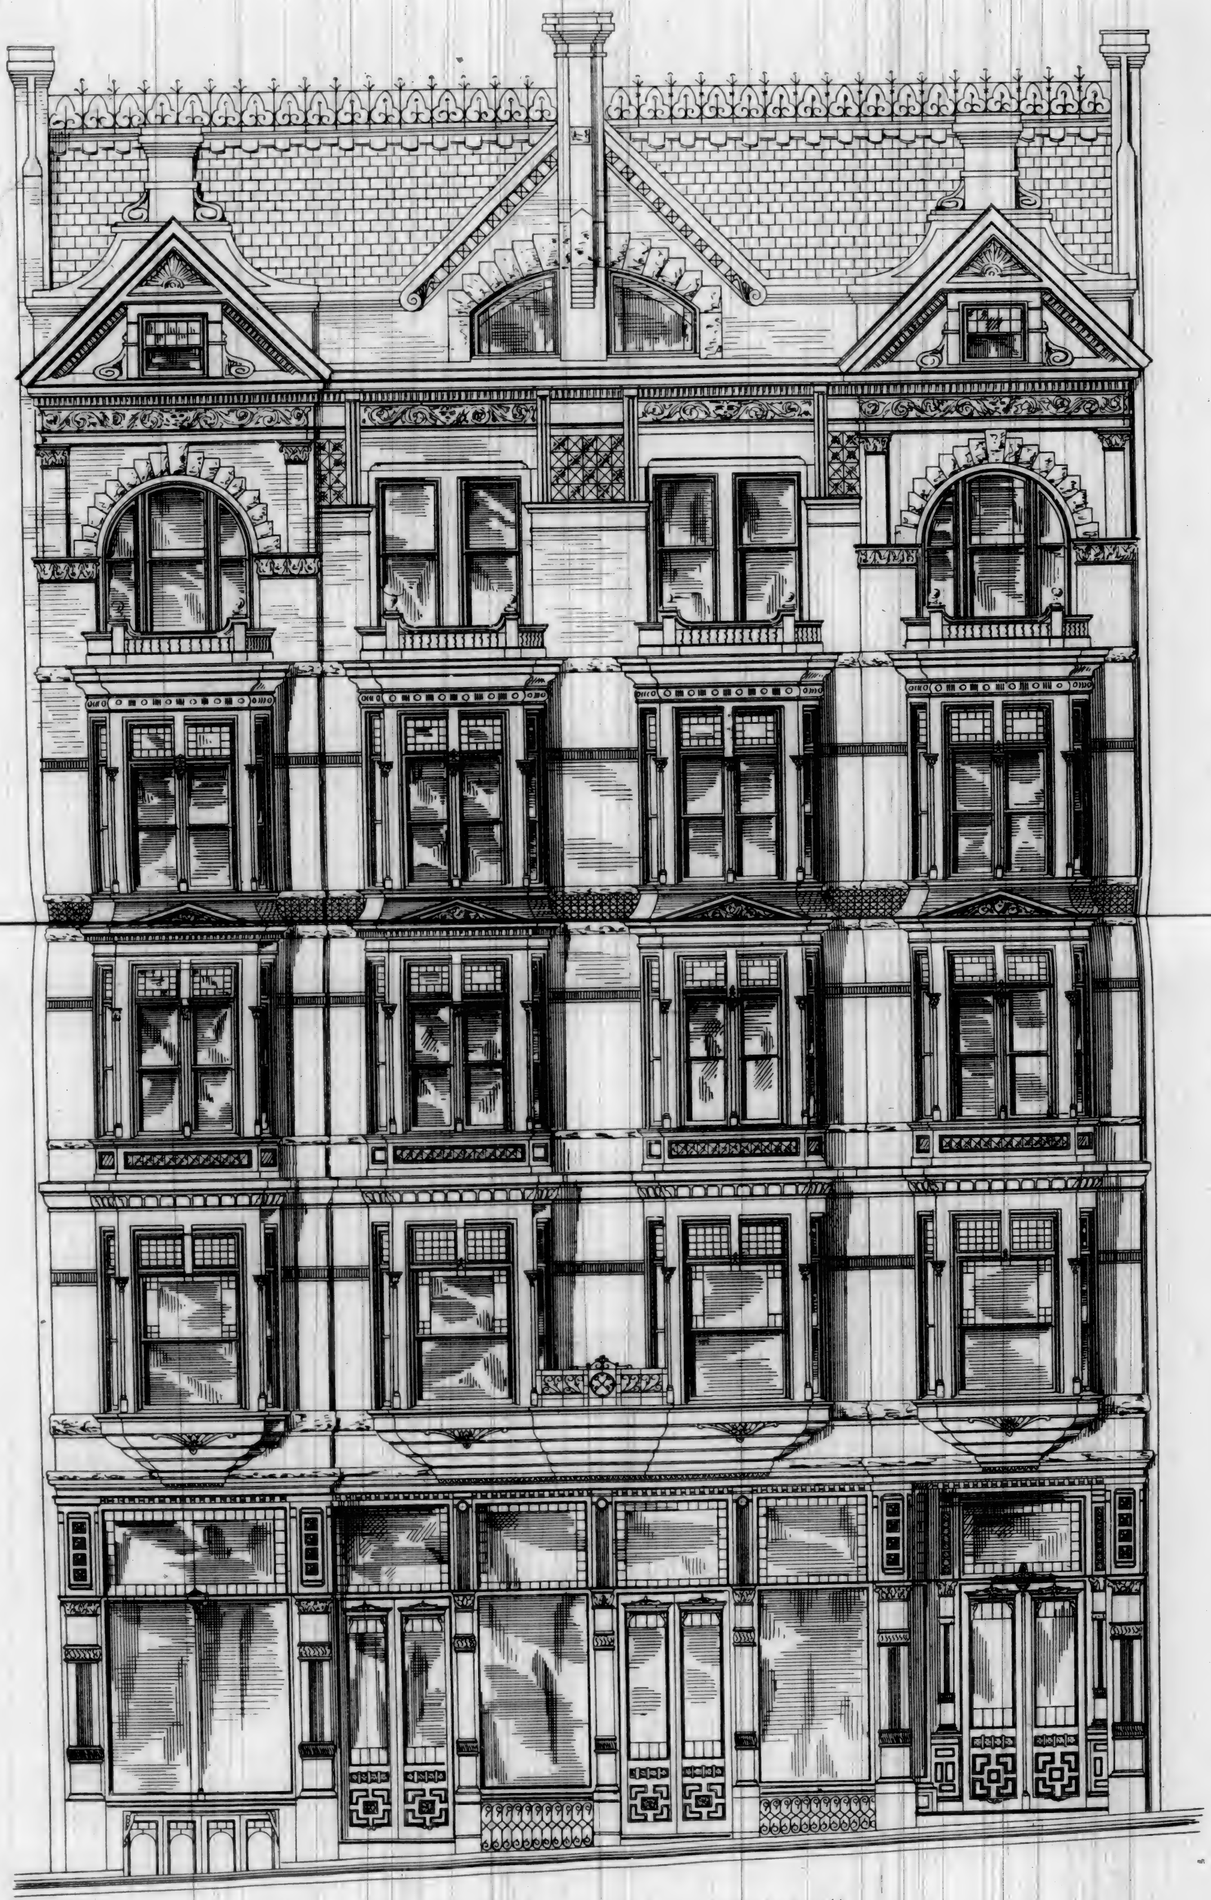
SPONTANEOUS IGNITION.

AN English authority says: "When oxide of iron is placed in contact with wood excluded from the atmosphere, and aided by a slightly increased temperature, the oxide parts with its oxygen and is converted into very finely divided particles of metallic iron having such an affinity for oxygen that, when afterward exposed to the action of the atmosphere from any cause, oxygen is absorbed so rapidly that these particles become red hot, and if in sufficient quantity will produce a temperature far beyond the ignitable part of dry timber. Whenever iron pipes are employed for circulation of any heated medium (whether hot water, hot air or steam), and wherever the pipes are allowed to become rusty, and are also in close contact with wood, it is only necessary to suppose that under these circumstances the finely divided particles of metallic iron become exposed to the action of the atmosphere (and this may occur from the mere expansion or contraction of the pipes) in order to account for many of the fires which periodically take place at the commencement of the winter season."

It is very difficult to get persons to believe that there is any danger arising from the contact of steam pipes with wood, notwithstanding that there have been well-attested cases of fire originating from this cause.

The fire at the Washington residence of Secretary Tracy, was ascribed to the burning off of the felt insulation, allowing the heating pipes to come in contact with the wood work.

The increased use of steam for heating purposes makes a close study of the subject of spontaneous ignition imperative, particularly on the part of furnace builders.—*Building Trade Journal.*



THE GENERAL KEYES BUILDING.

STOCKTON AND O'FARRELL STS.

CHAS GEDDES
ARCHITECT.

JAS. E. WOLFE ARCHITECT.

A TEN CLASS SCHOOL BUILDING, EUREKA, HUMBOLDT CO. CAL.

Residence on Lyon Street, between Clay and Washington.

PISSIS & MOORE, Architects.

THE CITY RESIDENCE.

ITS DESIGN AND CONSTRUCTION.

—BY—

W. B. TUTHILL, A. M. ARCHITECT,

AUTHOR OF "PRACTICAL LESSONS IN ARCHITECTURAL DRAWING," "THE SUBURBAN COTTAGE," AND EDITOR OF *Interiors and Interior Details*.

NEW YORK—Wm. T. Comstock, 23 Warren street.

The above is a new book we have just received; in it the author treats in a clear manner of the arrangement of the Dwelling House, the Tenement House and the Apartment House, and continuing, explains in detail the construction of each building from the foundation to the roof, and gives lucid descriptions of the methods employed by the various mechanics and points out what should be avoided as well as the best methods to employ.

The price is $2.50, sent by mail free of postage to any part of the world.

The Engineering and Building Record presents another of its competitive designs for a pumping station and water tower.

Architecture and Building for April 26, give drawings and descriptions of three kinds of trusses used in the roof of the amphitheater of the Madison Square Garden.

The American Architect and Building News devotes considerable space to articles on religious architecture of antiquity.

The Building Budget continues its translation of *Viollet-le-Duc's* description of mediæval construction, and gives several cuts of modern residences.

The Canadian Architect contains a paper read before the Architectural Sketch Club, by R. W. Gambier, Bonsfield, entitled "Notes on the Connection Between the Different Styles of Gothic."

The Inland Architect for April contains Chapters XIII and XIV of Romanesque Architecture, a paper on Colonial Architecture by C. Bryant Schaefer, Water Color Study as applied to Architecture, and the New Constitution and By-laws of the Illinois Chapter, A. I. A.

The second number of *The Architectural and Building Monthly* contains a variety of plans, elevations and details of residences and other buildings.

The April number of *The Architectural Era* contains, under the head of "Mediæval Architecture," a description of Notre Dame Cathedral.

The *National Builder* for May continues the papers on "Mortars and Cements," by Adolph Cluss, besides giving the usual number of illustrations.

In the April number of the *Sanitary News* is an article by A. Arnold Clark, M. D., explaining how the dread disease, consumption, is spread, and the necessity of disinfecting the sputa of consumptives.

Number 6 of Volume 2 of the *Technology Architectural Review* has been received. It contains an article by Henry Van Brunt on "The Power of Simplicity" that deserves the careful study of thoughtful architects and designers. He concludes as follows:

"Let us never sacrifice a condition of use in order to accommodate a theory of design. Let the work develop under our hands from construction to beauty, as a flower from its roots, never grafting upon it a thought or motif which is not derived from its essential conditions of structure, suggesting by its material, or symbolic of its uses, remembering always that, as a general rule in architectural compositions, severity leads to strength and refinement, and prodigality to weakness and vulgarity. Thus shall we gain for the work of our hands the respect of practical men, and at last rehabiliate architecture as a living art.

A single graduating class from a good school of architecture, if loyal to this principle of "divine simplicity," never losing sight of it in all they may have to do in design, but never permitting it to degenerate into poverty and baldness, would animate our art with the breath of new life and confirm the movement of reform, which is already feeling its way; it would only need genius behind this loyalty to make a revolution. If it were my privilege and high function to be a teacher of architecture, the words I have written, advocating the largest knowledge of historical forms, and wise reserve and self-denial in the use of them, would be the last upon my lips as I sent forth my pupils into the world of action."

THE GENERAL KEYES BUILDING.

One of the handsomest buildings of its kind lately completed in this city, is the General Keyes building, an L-shaped structure having equal frontage on Stockton and O'Farrell streets.

The architect, Chas. Geddes, whose office is at No. 415 Montgomery street, has successfully designed a convenient and well arranged building, with fronts of pressed brick and stone trimmings, and has provided for all the modern conveniences so essential in a building of the kind.

The upper floors are devoted to hotel purposes, and have been leased for ten years to Mr. A. Wilkins, the well-known proprietor of the Cliff House. A portion of the ground floor on Stockton street has been fitted up as a café and billiard hall, with oyster and supper rooms.

It will be of interest to our many readers to know something of the various mechanics whose well directed exertions have resulted in the building shown in our double plate.

CONCRETE WORK.

George Goodman of 307 Montgomery Street contracted for and laid the concrete foundations, the basement floors, the subpavement and back areas aud sidewalks on both streets, as well as the foundations for all the machinery in the building. Mr. Goodman's work is of the highest standard and for that reason he leads all others in his line of business. He uses the Schillinger patent which has been tried and tested; and he has had so much experience in the use of cement that he thoroughly understands its manipulation and can guarantee the best results.

BRICK AND STONE WORK.

All the brick-work and stone-work, including the two fine pressed-brick fronts, with terra cotta and red sandstone trimmings, was executed by John McCarthy, one of the best-known building contractors in the city. His work speaks for itself, and no better evidence of the high esteem in which he is held can be cited than the fact that he is the principal contractor on such large structures as the *Chronicle* building and the new Academy of Sciences building and others.

CARPENTER WORK.

Adam Miller, whose office is at 516 Kearny street, superintended the carpenter work. Mr. Miller is a well-known builder of this city, and has erected many prominent buildings, one of which is the new Wells-Fargo Building. Being a thorough business man as well as a competent mechanic, attentive to his work, and always being careful to fulfill his agreements, he has carried out this contract in such a manner as to reflect credit on himself and the architect.

ARCHITECTURAL IRON WORK.

The firm of O'Connell & Lewis furnished and set all the cast iron work used in the construction of the premises, and did it in their usual workmanlike manner. These gentlemen have been established in business here for many years and are justly proud of the uniformly excellent quality of the work they have turned out, and in no part of a building is it more imperative to have the best of mateaials employed than in those parts of the construction that furnish the strength necessary to carry the weight of the building itself and of its contents. Any flaw or imperfection in a casting is a defect that may lead to serious danger to the future safety of a building, consequently the importance of obtaining only the best class of work can be readily perceived.

ILLUMINATING AND TILING.

P. H. Jackson, 228 and 230 First street, furnished and set the sidewalk lights. Mr. Jackson is the agent for many patents covering important points in reflecting lenses and in the construction of iron work and illuminating grates for all purposes. Mr. Jackson is an expert on all iron construction, having had

many years experience in New York City, where he was actively connected with the department of public works. He is frequently consulted where any doubt exists as to the safest and most economical methods of employing cast and wrought iron, and his opinion always carries the weight to which it is entitled. Mr. Jackson lately served with two prominent architects on a committee appointed by the New City Hall Commissioners to examine and report on the subject of the girders now being designed for use in the New City Hall.

ELEVATORS.

This building is furnished with two Patent Ellithorpe Air Brake, and Air Cushion, passenger elevators.

They are superior to any in use, from the fact that they run smoothly, and noislessly, and the absolute safety obtained by the application of the air brake, which is attached to the cage, and will stop a falling cage within five feet, without jar or damage to either cage or occupants.

Also the air cushion, which is built in the basement sufficiently strong to stand the strain should the cage fall from any floor, in case all other safety appliances fail the air cushion is always there, and never fails.

W. H. Birch & Co., 119 Beale St., the builders of these patents have tested these, and all others, 14 in number, built on this coast, by hoisting the cage to the top floor, disconnecting the ropes and air brake safety, suspending the cage by a Manilla rope and after placing eggs and several glasses of water in the cage (and in some instances human beings) the Manilla rope was cut, and the cage fell with frightful velocity in the air cushion at the bottom of the shaft, in no case was there an egg broken, a drop of water spilled or a person injured in the slightest degree.

MARBLE AND TILE WORK.

The marbelized iron mantels throughout the building were put in by W. W. Montague & Co. of Market street. They are handsome and serviceable, and in the latest designs. All the beautifully tiled vestibules and entrances of the building on both streets were laid by the same firm. They are in graceful patterns of caustics tiles. One of the handsomest pieces of majolica and enameled tile work in the city is the beautiful fountain set up by the firm in the cate.

ORNAMENTAL IRON WORK.

The contract for the ornamental iron work was let to Mr. H. Ralston of 151 and 153 Beale Street. In a building of this kind there is a great deal of wrought iron work such as iron beams, iron railings, strong tie bolts, crestings and wrought finials including the iron sidewalk beams on both frontages as well as numerous bolts, bars and smaller articles of iron all being tested before using. Mr. Ralston employs only first-class workmen and personally superintends all his work; thereby being greatly sought after by builders having large structures to build.

STAIRS.

All the stairs, consisting of two main flights clear from the ground floor to the top story, two series of rear stairs, the basement stairs and a short flight leading from the O'Farrell Street entrance to the cafe down into the billiard hall, were put in by A. I. Sanborn of Mission and Fremont Streets. The treads and stringers are of pine; the newels, rails, and balusters being of oak. The light wells of each story are also finished with oak rails and balusters, and have paneled pine faces.

PLUMBING.

A very important part of the building is the plumbing and ventilation. Shepard Bros. of 526 California street, the oldest plumbing firm in the city, were intrusted with the contract for this work. Amounting to $9,240.

The bath-tubs are Eastern enamel selected especially for this building with combination showers. The latrines and closets are of porcelain, and patent lip with self-closing automatic faucets. Heavy 4-inch iron pipes are run to each floor strong enough to withstand the strain of an engine pumping under the sidewalk with sufficient force to send water through every floor, back and front and to the roof. There is a system of valves for water so that it can be used separately, cut off or as a whole. The washstands are of marble fitted up with Fuller's No 3 filtering faucets. There are 14 gas meters in the building and by means of a distributor can be concentrated as in the system of valves. The Shepard Bros. are well-known as doing nothing but first-class work, thereby giving entire satisfaction to all their patrons.

ARTISTIC GLASS.

Mr. John Mallon, of the Pacific Glass Staining and Embossing Works, did the glass cutting and bending in this building. He is a pioneer in his business, and any work done by him is of first quality. Mr. Mallon has the contract for the Memorial window in the St. Paul's Church at Sacramento for the late Leland Stanford, Jr., which, for beauty of design and finish, equals if not surpasses anything of its kind in the United States. His Cutting Works are at 19 Fremont street, and his Stained Glass Works are at 1213 and 1215 Howard street.

PAINTING.

Mr. Thomas Downing, the pioneer painter, No. 613 Mission street near Second, was selected to the painting and gilding. Nothing improves a building so well as to have it properly painted and the materials used must be of the best to stand wear. Mr. Downing's name is a sufficient guarantee that this contract has been fulfilled carefully as he is known never to slight work that he has anything to do with. Many of the finest buildings in this city attest his skill and artistic ability. Person having any business in his line would do well to call on him before letting out their work elsewhere.

HOSE REELS.

Chapman's Empire hose reels have been liberally supplied, twelve of these important protectors against fire having been located where they will be easy of access and so arranged as to be effectively employed should occasion require. The usefulness and convenience of these hose reels cannot be over estimated, and Wm. Chapman, 18 California street, who, by the way, was formerly Fire Inspector of the Board of Underwriters, is only too pleased to explain the advantages of being able to control an instantaneous supply of water at the moment of its greatest efficiency, that is to say, when a fire has just started and before it has had time to become a resistless conflagration. All that is necessary to do to obtain a supply from one of these reels is to turn the valve and unroll the hose, and a stream of water follows.

CAFE AND BILLIARD HALL.

Mr. A. Wilkins, proprietor of the Cliff House, has leased this fine building for a period of ten years and has succeeded in finding tenants for the two rooming houses and the stores beneath them.

The lower portion of the building on Stockton street, with an entrance also from O'Farrell street, will be used as a cafe, billiard hall, ladies and gentlemen's oyster and supper rooms and a grill room. The entire building is lighted by electricity and is the first building in this city lighted by an electric plant on the premises.

The billiard hall is handsomely fitted up and no expense has been spared to make it the finest one here. An elegant feature of the cafe is a fountain lighted by electricity set round with plants and ferns with prismatic colors thrown on the spraying waters. Mr. Wilkins has been a resident here for twenty-six years and having had so long an experience knows exactly how to meet the wants of his patrons.

PIANO WAREROOMS.

The Hemme & Long Piano Company, an old and well-known established firm of which J. B. Curtis is the Secretary, having been in business here for the last fifteen years, occupy one of the stores on the O'Farrell Street side, the number of which is 107. This company has a large factory at 1643 Polk Street corner of Clay and have a capital stock of $100,000. Their warerooms are at all times supplied with instruments of their own manufacture, which are conceded to be second to none in tone, brilliancy, durability and excellence of finish. They are sold at medium prices on easy installments and warranted for six years. Persons in want of a fine instrument should call at Hemme & Long's.

1020 Oak Street, Oakland, Cal., April 24, 1890.

The letter following speaks for itself:

Mr. Charles Geddes.

Dear Sir:—I de ire to say something to those who have assisted me in the construction of the building on Stockton and O'Farrell streets, of which I am the principal owner.

You, as architect, with the aid of your able draftsman, Mr. B. Wood, are the sole authors of the plan of the building. The lightness and beauty of the exterior every passer can judge. As to the interior, it is acknowledged by the lessee and the occupants to be admirable; the lighting, ventilation, and drainage seem to be perfect. A flue is found wherever one is needed. The pipe shaft, 8 feet square, in the center of the building to receive all down pipes, both of roof, water and plumbing supplies, etc., enclosed in brick walls, running from basement to roof without cover, to give ventilation and access to all pipes at pleasure, is in my mind one of the best features of the building. And last but not least, the cost of the building has not exceeded my estimate. I now cheerfully recommend you to any person who intends to construct a large building.

Yours truly,

E. D. Keyes.

THE architect's work, while the largest importance and most enduring of all artistic efforts, with the exception of a few solitary instances, does not perpetuate his name. As to the design of our City Hall, one of the most artistic buildings of this city, there seems to be some doubt as to who is the architect; at least, authorities differ.

In a few public buildings there is a tablet set up, giving the architect, the engineer, the contractors, and perhaps the committee having it in charge. In a picture the artist writes his name in the corner, and the owner sets a higher value on the work according as the name is one of note. If architecture is, as we believe, the fruit of artistic conceptions, why not allow the artistic architect the privilege of writing his name in some corner tablet? Would not the fact of this record being put on his work make him more earnest in his efforts to make the work in accord with his highest conceptions?—while the name of a reputable architect would be, to a certain extent, a voucher for the character of the building. One of the unsatisfactory features of the present method is in visiting new localities and inquiring as to the architect of attractive buildings; very frequently no one can inform you. The name of the designer is forgotten almost as soon as the plans have left his hands; whereas a modest record on an appropriate tablet would be a credit both to the architect and the building, and would often be convenient in later years in seeking the original designs, should alterations be desired.—*Architecture and Building.*

CITY BUILDING NEWS.

Baker and Jefferson. Two-story frame; owner, W. T. Commary; architect, P. R. Schmidt; contractor, J. A. Kretschmar; cost, $5,624; signed, April 10; filed, April 11; payments, $1,959, framed; $1,050, brown coated; $1,050, hard finished; $1,050, completed; $1,421, 35 days.

Baker and Turk. Cottage; owner, T. Tobin; architect, W. H. Lillie; contractor, M. J. Scott; sureties, J. Young and J. Molhen, $800; cost, $1,655; singed, March 8; filed, March 10; paymen s on first and fifteenth day of each month in sums equal to 75 per cent of value of work done; balance 35 days.

Broadway and Larkin. Two-story building; owner, J. W. Kentzel; architects, Shea & Shea; contractor, P. Griffin; sureties, W. J. Adams and A. D. Moore. $4,100; cost, $4,199; signed, April 12, filed, April 14; payments, $785, framed; $785, brown coated; $786, hard finished; $786, completed; 1948, 35 days.

Bush between Polk and Van Ness. Three-story frame; owner, J. Schweitzer; architect, Kenitzer Kollofrath; contractor, M. J. Gorman; cost, $8,823; time, August 26, '90; signed, April 14; filed, April 15; payments, $1,000, framed; $1,500, enclosed, $1,200, first coat of plastering is on; $1,200, plastered; $1,723, completed; $2,200, 35 days.

Baker and Jackson. Additions; owner, J. Urback; contractor, S. A. Nagel; cost, $2,000; time, 65 days; signed, April 2, filed, April 15; payments, $500, foundations in; $500, brown coated; $500, accepted; $500, 35 days.

Brick and carpenter work. Owner, Dr. C. Kleineberg; architects, Salfield & Kohlberg; contractor, E. C. Worden; sureties, L. T. Lewis and L. B. Doe. $6,467; cost, $8,167; signed, April 7; filed, April 16; payments, $1,000, floored; $1,640, completed; $867, 35 days.

Buchanan and Gilbert. Two story; owner, V. N. Drouet; contractor, A. N. Nelson; cost, $6,720; time, June 30, 1890; signed, April 23 1; filed, April 24th; payments, $6 0, framed; $700, brown mortared; $743, waite coated; $300, completed; $1,000, 35 days.

Baker and Bush. Two-story frame; owner, T. Brady; architect, M. J. Welch; contractor, Ivory Wells and H. S. Joslin; cost, $3,640; signed, April 21st; filed, April 28th; payments, $912.50, framed; $912.50, brown mortared; $912.50, completed; $912.50, 35 days.

Bush Street, 1613. Owner, H. M. Herriman; architect, C. Geddes; contractor, C. E. Dunchee; time, 53 days; filed, April 30, 1890; payments, none specified.

Building on City Hall Avenue. Sidewalk; light work; owner, Mr. Marye; architect, Smith & Freeman; contractors, Bigelow & Little; cost, $1,850; signed, April 10th; filed, May 2nd; payments, 75 per cent. to be paid as work progresses; 25 per cent. 35 days.

Clinton and Brannan. Two-story frame; owner, M. Frederick; architect, P. R. Schmidt; contractor, F. W. Kern; cost, $3,880; signed, April 5th; filed, April 9th; payments, $890, framed; $700, brown coated; $700, hard finished; $700, completed; $990, 35 days.

Clay and Baker. Alterations; owner, Mrs. A. Smith; architect, M. G. Bugbee; contractor, A. Nelson; cost, $2,925; signed, April 23d; filed, April 23d; payments, $731.25, framed; $731.25, brown coated; $731.25, accepted; $731.25, 35 days.

Castro, between 18th and 19th. Frame; owner, A. Hauffe and wife; contractor, J. C. Brown; signed, April 17; filed, April 21; payments, $250, foundations laid; $500, framed; $600, brown coated; $400, completed.

Clay and Broderick. Alterations, etc.; owner, Mrs. R. Levy; architects, A. J. and T. D. Newsom; contractor, W. G. Miller; cost, $2,3 0; signed, April 29; filed, April 2+; payments, $387, brick work done; $387, brown mortared; $388, completed; $388, 35 days.

California and Polk. Three-story building; owner, P. Clement; architect, C. M. Rossetti; contractors, J. E. Kennedy and H. Hodgkins; cost, $7,150; signed, April 3; filed, May 1; payments, $1,000, framed; $1,000, brown coated; $1,290, white coated; $1,860, 35 days.

Douglas and Eighteenth. Two-story frame; owner, J. Woods; architect, J. J. Clark; contractor, M. J. Egan; surety, S. H. Harmon, $3,500; cost, $4,048; time, 90 days; signed, April 23; filed, April 26; payments, $771, framed; $771. brown coated; $771, completed; balance, 35 days.

Dore and Harrison. Carpenter work; owners, F. Nelson and wife; contractors, Mullins Bros. cost, $1,257; time, July 2, '90; signed, April 21; filed, April 22; payments, $300, framed; $300, brown mortared; $357, finished; $300, 35 days.

Decatur street, off Bryant. Alterations; owners, T. Mulhern and wife; contractors, Mullins Bros.; surety, T. Mullins, Sr., $850; cost, $994; signed, April 28; filed, May 2; payments, $150, brick work done; $240, framed; $350, plastered; $254, completed.

Eighth and Minna. Two-story building; owner, C. Ryan; architect, J. J. Clark; contractor, C. N. Smith; sureties, H. Blythe, W. J. Trott and F. Jost. $6,000; cost, $6,700; filed, April 26; payments, $1,256.25, framed; $1,256.25, enclosed; $1,256.25, brown mortared; $1,256.25, inside finish completed; balance, 35 days.

Ellis and Powell. Painting, etc.; owner, C. Mangels; architect, H. Geilfuss; contractor, A. Eick; cost, $2,330; signed, April 9; filed, April 10; payments, first of each month, 75 per cent. of value of work done; balance, 35 days.

Ellis and Powell. Lathing, etc.; owner, C. Mangels; architect, H. Geilfuss; contractor, A. O'Brien; cost, $7,444; signed, April 9; filed, April 10; payments, first day of each month, 75 per cent. of value of work done; balance, 35 days.

Ellis and Powell. Patent light iron doors sills, etc.; owner, R. Llewellyn; architect, H Geilfuss; contractors, P. H. Jackson & Co.; cost, $1,549; signed, April 9; filed, April 10; payments, fifth day of each month, 75 per cent. of value of work done; balance, 35 days.

Eureka and Seventeenth. Two-story; owner, F. Garrissere; contractor, B. Dreyer; cost, $4,700; signed, April 5; filed, April 7; payments, $1,175, framed; $1,175, brown coated; $1,175, white mortared; $1,175, 35 days.

Ellis and Powell. Wrought iron and steel work; owner, R. Llewellyn; architect, H. Geilfuss; contractors, Todt, Bass & Co.; cost, $4,988; signed, April 9, filed, April 18; payments, 75 per cent. of work performed; 25 per cent., 35 days.

Ellis and Powell. Stone work; owners, Riley & Loane; architect, H. Geilfuss; contractors, Mentone, Stone & Co.; cost, $4,750; signed, April 9; filed, April 18; payments, $1,600, basement walls built; $600, third floor joists laid; $650, fourth story floor joists laid; $700, fifth story floor joists laid; $1,200, 35 days.

Ellis & Powell. Plumbing, etc.; owner, C. Mangels; architect, H Geilfuss; contractor, S. Ickelheimer; cost, $10,350; signed, April 9; filed, April 10; payments, first of each month, 75 per cent. of value of work done; balance, 35 days.

Ellis and Powell. Cast and wrought iron; owner, C. Mangels; architect, H. Geilfuss; contractor, Reese Llewellyn; cost, $17,890; signed, April 9; filed, April 10; payments, first of each month, 75 per cent. of value of work done; balance, 35 days

Ellis and Powell. Carpenter Work; owner, C. Mangels; architect, H. Geilfuss; contractor, F. W. Kern; cost, $22,800; signed, April 9; filed, April 10; payments, $5,514, fourth-story floor joists are laid; $5,514, roofed; $5,514, floors laid; $5,514, ready for lathing; $5,514, standing finish on; $5,514, inside finish on; $5,516, completed; $8,200, 35 days.

Ellis and Powell. Six-story brick; owner, C. Mangels; architect, H. Geilfuss; contractors, Riley & Loane; cost, $24,200; signed, April 9; filed, April 10; payments, $2,991, basement walls laid; $2,991, second-story floors laid; $2,991, third story floors laid; $2,991, fourth-story floors laid; $2,991, fifth-story floors laid; $2,990, fire walls topped out; $6,050, 35 days after brick work is laid; $300, 35 days.

Front and Oregon. Carpenter work; owner, Jas. G. Fair; architect, Schultz & Meeker; contractor J. S. McKay; cost, $8,395; signed, April 8; filed, April 12; payments, first of each month, 75 per cent. of value of work done; balance, 35 days.

Folsom and Fourth. Alterations; owner, P. G. Lompo; architect, G. E. Voelkel; contractor, F. Klatt; cost, $9,965; signed, April 21st; filed, April 21st; payments, $1,000; moved back, $1,000; enclosed, $1,200; first coated, $1,200; second coated, $1,250; doors hung, $1,623; accepted, $2,492, 35 days.

First and Harrison Three-story frame; owner, G. W. Ahrens; architect, H. Geilfuss; contractor, F. Klatt; cost, $5,855; signed, April 19; filed, April 23; payment, $875, framed; $875 enclosed; $875, brown mortared; $875, outside finish on; $875, completed; $1,469, 35 days.

Fourteenth and Noe. Two story; owner, Joost & Van Glash; architect, C. R. and J. M. Wilson; contractor, A. McKay; cost, $4,090; signed, April 10; filed, April 12; payments, $600, framed; $600, enclosed; $600, brown coated; $600, white coated; $938, 35 days.

Fourteenth and Howard. Owner, I. Gutte; architect, Kenitzen & Kollofratte; contractors, Schutt & Krecker; surety, T. C. Jensen and T. Hock, $8,000; cost, $10,545; signed, April 15; filed, April 16; payments, $1,200, framed; $1,500, endorsed; $1,200, brown coated; $1,800, plastered; $2,215, completed; $2,630, 35 days.

Florida and Butte. Alterations, etc.; owner, M. Feahy; architect, W. Nichol; contractor, J. F. McLaughlin; cost, $1,800; signed, April 11; filed, April 14; payments, $200, raised; $250, partitions set; $350, brown coated; $200, white coated, $350, finished; $450, 35 days.

Front and Oregon. Art stone work; owner, J. G. Fair; architects, Schultz & Meeker; contractor, George Goodman; cost, $2,146; signed, April 9; filed, April 12, payments, first day of each month, 75 per cent. of value of work done; balance, 35 days.

Front and Oregon. Painting; owner, J. G. Fair; architect, Schulze & Meeker; contractor, Fraser & Keefe; cost, $775; signed, April 9; filed, April 12; payments, first day of each month, 75 per cent. of value of work done; balance, 35 days.

Front and Oregon. Plumbing; owner, J. G. Fair; architect, Schulze & Meeker; contractor, W. S. Snook & Co.; cost, $874; signed, April 9; filed, April 12; payments, first day of each month, 75 per cent. of value of work done; balance, 35 days.

Front and Oregon. Tinsmith's work; owner, J. G. Fair; architect, Schulze & Meeker; contractor, J. F. Forderer; cost, $498; signed, April 9; filed, April 12; payments, first day of each month, 75 per cent. of value of work done; balance, 35 days.

Front and Oregon. Elevator; owner, J. G. Fair; architect, Schulze & Meeker; contractor, Cahill and Hall; cost, $1,020; signed, April 4; filed, April 12; payments, first day of each month, 75 per cent. of value of work done; balance, 35 days.

Front and Oregon. Wrought iron work; owner, J. G. Fair; architect, Schulze & Meeker; contractor, Western Iron Works; cost, 2,100; signed, April 10; filed, April 12; payments, first day of each month, 75 per cent. of value of work done; balance, 35 days.

Front and Oregon. Cast iron; owner, J. G. Fair; architects, Schulze & Meeker; contractor, McCormick; cost, $1,865; signed, April 8; filed, April, 12. payments, first day of each month, 75 per cent. of value of work done; balance 35 days.

Grove and Lott. Three-story frame; owner, J. and L. Hirch; architects, Salfield & Kohlberg; contractor, T. W. Ward; sureties, A. E. and W. Dickens. $6,000; cost, $6,700; signed, March 3; filed, April 8; payments, $1,000, framed; $1,200, brown coated; $1,000 doors hung; $1,825, accepted; $1,675, 35 days.

Grand Ave. and Mission. Two-story; owner, E. Preston; architects, Percy & Hamilton; contractor, G. Bowser; cost, $3,090; time, 75 days; signed, April 7; filed, April 7; payments, $200, basement in; $550, enclosed; $750, brown coated; $750, completed; $750, 35 days.

Gough and Green. Two-story; owner, F. Remshkolb; architects, John & Balczynski; contractor, G. Weismann; cost, $5,187; signed, April 12; filed, April 12; payments, $1,000, framed; $900, enclosed; $987, white coated; $1,000, accepted; $1,300, 35 days.

Guerrero between 17th and 18th. Alterations; owner, E. Knox; architects, Townsend & Wyneken; contractor, G. Houston; cost, $3,638; time, 90 days; signed, April 10; filed, April 11; payments, $900, rustic on; $900, brown coated; $900, white coated; $938, 35 days.

Gough and Hayes. To raise house. Owner, B. Daniels; contractor, P. Gleason; cost, $300; signed, April 22; filed, April 24; payments, 75 per cent as work progresses; 25 per cent when completed.

Gough and Hayes. Grading. Owner, B. Daniels; contractor, Hogan & Burris; cost, $400; signed, April 22; filed, April 24; payments, 75 per cent as work progresses; 25 per cent when completed.

Gough and Hayes. Brick-work; owner, B. Daniels; contractor, J. O. Sullivan; cost, $1,320; signed, April 22; filed, April 24; payments, 75 per cent. as work progresses; 25 per cent. when completed.

Guerrero and Seventeenth. Two-story frame; owner, F. McGee; architect, A. J. Barnett; contractor, Tegeler & Muller; sureties, L. Schloh and W. H. Bowe; $2,500; time, 90 days; signed, April 3; filed, May 1; payments, $1,000, roofed; $1,330, brown mortared; $1,330, completed; $1,225, 35 days.

Greenwich and Baker. Two-story frame; owner, G. F. Nelson; contractor, J. McConaghy; cost, $1,600; signed, April 21; filed, April 30; payments, $400, framed; $400, brown mortared; $400, completed; $400, 35 days.

Howard and Second. Brick and iron; owner, F. C. Janssen; architect, H. Geilfuss; contractors, Brennan & Sladung; cost, $10,898; signed, April 3; filed, April 10; payments, $2,724, granite set; $2,724, second story walls ready for joists; $2,725, brick-work done; $2,725, 35 days.

Howard and Second. Carpenter work; owner, F. C. Janssen; architect, H. Geilfuss; contractor, Paff Bros.; cost, $11,000; signed, April 3; filed, April 10; payments, $1,650; roofed; $1,650; lathed; $1,650, brown mortared; $1,650, white coated; $1,650, completed; $2,750, 35 days.

Hayes, between Buchanan and Webster. Two-story; owner, C. M. Gable; architect, J. E. Kraft; contractor, W. W. Ackerson; sureties, J. Greig and E. P. Blake, $3,000; cost, $6,315; signed, March 29; filed, April 10; payments, $1,885, enclosed; $1,750 brown coated; $1,250, accepted; $1,630, 35 days.

Harrison and Ninth. Owner, J. McElearney; architect, M. J. Welch; contractor, C. A. Lafferty; cost, $10,000; signed, April 12; filed, April 14; payments, $1,875, framed; $1,875, brown coated; $1,875, exterior finish on; $1,875, completed; $2,500, 35 days.

Hayes and Webster. Three-story frame; owner, S. Mier; architect, A. J. Barnett; contractor, Brennan Bros.; sureties, J. J. McKinnon and P. F. Latson, $1,000; cost, $8,400; signed, April 17; filed, April 18; payments, $600, first floor joists on; $1,000, framed; $1,000, brown coated; $1,600, white coated; $2,100, completed; $2,100, 35 days.

Hayes and Broderick. Three-story frame; owner, J. L. Franklin; architect, M. J. Welch; contractors, O. Brault and J. Miron; cost, $7,340; signed, April 17; filed, April 19; payments, $1,376.25, framed; $1,376.25, brown mortared; $1,376.25, exterior finish up; $1,376.25, completed; $1,835, 35 days.

Howard and 23rd. Three-story frame; owner, Mrs. M. Engel; architect, H. Geilfuss; contractor, T. L. Hansen; cost, $5,800; signed, April 23; filed, April 22; payments, $795, framed; $795, enclosed; $795, brown coated; $795, white coated; $795, complete l; $1,325, 35 days.

Henry and Sanchez. Two frame buildings; owner, W. Brown; contractor, W. W. Redmall; sureties, D. Dodge and J. Springer & Co.; $6,850; cost, $6,850; time, 65 days; signed, April 26; filed, April 28; payments, $1,500, roofed; $1,500, brown coated; $2,000, completed; $1,850, 35 days.

Hardie Place and Kearney. Plumbing; owner, C. Schroth; architect, J. Marquis; contractors, Fritz and Kean; cost, $2,200; signed, April 21; filed, April 23; payments, $800, pipes laid; $850, accepted; $550, 35 days.

Hartford, between 19th and 20th. Frame; owner, L. Lander; contractor, W. P. Clark; cost, $2,100; signed, April 25; filed, April 30th; payments, $700, framed; $700, brown coated; $700, 35 days.

Hollis, between O'Farrell and Ellis. Alterations; owner, P. Beanston; architects, Townsend & Wyneken; contractors, M. H. and M. Berry; sureties, P. Gilloughly and B. Hobart; cost, $2,000; time, 90 days; signed, April 7; filed, April 30; payments, $400, frame is up; $313, first coat of mortar in on; $400, first coat of paint on; 400, completed; $387, 35 days.

Howard and Fifth. Three-story frame; owner, B. F. Butler; architects, J. J. and T. D. Newsom; contractors, C. Plainer and R. R. Thornton; cost, $21,450; time, 100 days; signed, April 29; filed, April 30; payments, $2,146, brick-work done; $2,146, ready for first coat of plaster; $2,146, plastered; $2,149, completed; $1,840, 35 days.

Haight and Devisadero. Two-story frame; owner, C. L. Moxley; architect, A. J. Barnett; contractor, T. Morris; sureties, R. Llewellyn and L. T. Adeline street. Two-story frame; owner, C. Wiedersheim; contractor, Herbert Kendall & Co.; cost, $2,425; time, 75 days; signed, April 14; filed, April 14; payments, $500, foundation laid; $500, shingled; $500, brown mortared; $500, putty coat on; ——— completed.

S. W. corner Thirteenth and Alice Sts. Owner, G. Miller; architect, S. Newsom; contractor, W. T Veitch; cost, $7,600; signed, March 22; filed, April 12; payments on the first and fifteenth day of each month, at the rate of 75 per cent. of value of work done; balance, 25 per cent., 35 days.

Madison and Seventh Sts. Cottage; owner, F. E. Brangs; architects, Townsend & Wyneken; contractor, W. Matthews; cost, $1,530; signed, March 26; filed, April 10; payments, $500, roof on; $530, completed; $500, 35 days.

Poplar and Fourteenth Sts. Two-story frame; owner, Geo. Smith; architect, Chas. Mau; contractor, J. H. Fones; cost, $1,622; signed, April 9; filed, April 10; payments, $1,173, one-third work done; $1,173, two-thirds work done; $1,173, completed; $1,173, 35 days.

Klinkler and San Pablo Ave. Owner, E. F. Murphy; contractor, A. W. Pattiani; cost, $2,554; signed, April 8; filed, April 9; payments, 750, chimneys built; $650, brown mortar on; $514, completed; $640, 35 days.

Isabella St. One-story cottage; owner, S. Palinbaum; contractor, A. J. McKee; cost, $2,561; signed, April 8; filed, April 9; payments, $80, roof on; $800, brown mortared; $961, completed.

Twenty-eighth and West Sts. Addition of six rooms to Durant School; owner, City of Oakland; architect, W. J. Matthews; contractors, C. L. Crisman and H. T. Brown; cost, $12,174; signed, April 8th; filed, April 9; payments, $2,282.62, one-fourth of work completed; $2,282.62, one-half of work completed; $2,282.62, three-fourths of work completed; $3,043.50, 35 days.

Two-story frame; owner, Mrs. H. B. Abbott; contractor, J. H. Fones; cost, $1,045; time, 30 days; signed, March 29, filed, April 8; payments, $261.25, framed; $261.25, brown mortared, $261.25, completed; $261.25, 35 days.

Lot 8, Block E. Cottage; owner, J. Ryder; contractor, W. A. Powell; cost, $1,390; time, June 15, 1890; signed, March 31; filed, March 31; payments, $325, framed; $325, roofed; $325, plastered; $325, 35 days.

EXAMPLE OF A

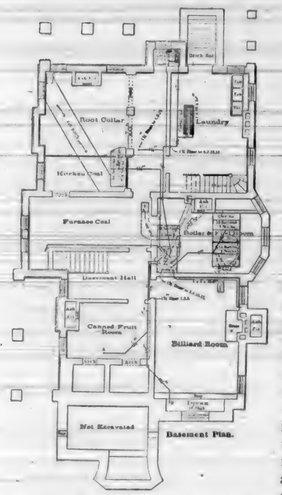
HOT WATER HEATING JOB

—DONE IN THE RESIDENCE OF—

JEREMIAH DWYER, Esq., President of the Michigan Stove Co., Jefferson Avenue, Detroit, by the

DETROIT HEATING AND LIGHTING CO., DETROIT, MICH.

(From the *American Artisan*, Nov. 9, 1889.)

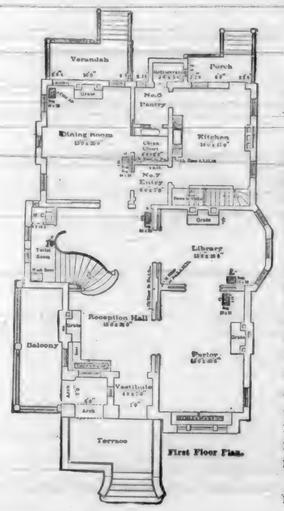


Basement Plan.

In a recent issue of the *American Artisan*—that of October 26—we gave an extended account of the hot water method of heating, advocated by our friends of the Detroit Heating and Lighting Company, together with a minute description of the admirable Bolton Heater, whereby they carry it into effect.

We desire to let our readers judge of systems and inventions by ascertainable facts, and so, to give them a fair chance on the heating system under notice, and this from the features of a demonstrated success, we now furnish an account—with explicit plans—of its application in the private residence of a gentleman who may be named as one of the largest stove manufacturers in the world, and therefore a most competent judge in the selection of appliances of this very kind. We allude to Jeremiah Dwyer, the well known President of the Michigan Stove Company, of Detroit, whose house, which is located on Jefferson Avenue, is a handsome brick structure with elaborately carved red sandstone trimmings, the general effect being very rich and pleasing. It is one of the most striking of the many new and costly residences on this fine street, and one of the most elaborately and tastefully furnished houses in the Northwest.

Mr. Dwyer, as a stove man "from way back," looked with suspicion on the new-fangled device for warming houses, but after a great deal of consideration and, as he says, in a recent letter, "after much consultation with his associates," he decided to put in hot water, and we may say he is most enthusiastic over the result of this experiment.



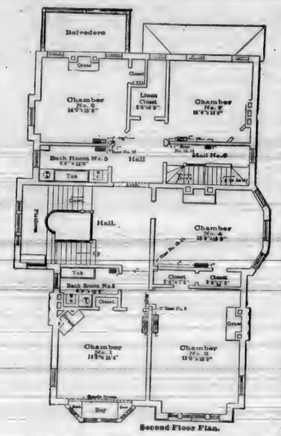
First Floor Plan.

The heater used is a No. 7, two-fire-pot Bolton, located in the "boiler room" in the basement, as shown on plans.

In the basement the only rooms heated are the billiard room, in which there is a coil on the wall; and the laundry and a closet, heated by coils suspended from the ceiling.

The cold-room in the basement receives air from out of doors, which is passed over the indirect radiators and warmed on its way to the registers in the first floor. The air-supply can be regulated according to the weather outside, but always affords an ample supply of fresh, pure air to the rooms above.

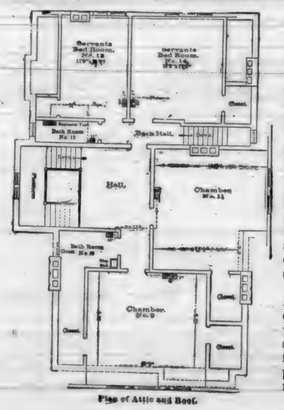
On the first floor the radiation is almost entirely indirect, the warmed air being admitted through electro-bronze registers of Moorish design. The direct radiation on this floor consists of two coils placed under the window seats of the reception hall and parlor. That in the parlor, on account of the lowness of the window seat, had to be sunk several inches below the level of the floor. Both coils are concealed by antique brass screens.



The second and third floors are heated by direct radiation. In the bath-room on the third floor is the expansion tank, which is always open to the atmosphere, so that there is never any pressure upon the pipes, except the weight of the water which they contain, and therefore no possibility of explosion.

The plans show the location of all registers and radiators, as well as of the pipes leading to them. The risers are marked with their diameters, and with numbers indicating the radiators which they supply. Lines of exposed pipe are shown by solid lines leading from the heater, and dotted lines show where concealed supply pipes are run under the floor. Only the flow pipes are given, as the return pipes are run, in every case, parallel and close to the flow pipes. The whole constitutes the perfection of a first-class heating apparatus, highly effective and economical in its operation, and is an interesting example of the methods of modern hot water engineers.

The apparatus for this work is, as above stated, the well-known Bolton Heater, which has such an excellent record for long and creditable service in the climates of Winnipeg and Montreal. In this country it is manufactured by the Detroit Heating and Lighting Company, and has rapidly attained a wonderful popularity. As a further indication of the extent of the Company's operations, it may be stated that among their many contracts they are now putting one of their heaters into the Washington residence of Senator McMillan; one in the remodeled residence of ex-Mayor Wm. G. Thompson, of Detroit, where a $50,000 fire was recently caused by a defective heating apparatus; one in the Whitney National Bank at New Orleans; one in the residence of Mr. Jarvis Richards, President of the First National Bank at Chadron, Neb.; and one in the residence of W. W. Spalding, of Duluth, Minn. This also shows the wonderful adaptability of this system of heating to all ranges of climates, from the blizzard region of the Northwest down to the shelterless Western plains and the stormy Southern gulf.



OFFICE OF
THE MICHIGAN STOVE CO.

DETROIT, Apr. 22, '89.

Detroit Heating & Lighting Co.

DEAR SIRS—Replying to your favor of recent date, asking my opinion in regard to your Bolton Patent Hot Water Heater, which you put in my new house last fall, would say that it was only after considerable thought by my associates and self on the subject of heating and ventilation that we concluded that hot water was the best artificial heat, if the system of circulation and workmanship was properly done.

Your Heater, I consider A1, and your system of circulation and workmanship is well done, and every way satisfactory to myself and family, and I take great pleasure in making this statement. Yours respectfully,

JEREMIAH DWYER.

NOTICE.

MR. George H. Wolfe, having no further connection with the business of this journal, correspondents will in future address their communications to the *California Architect and Building News*, 408 California street, San Francisco, Cal.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE ARCHITECTS, meets second Friday of each month at 408 California Street.

SETH BABSON, Pres. W. P. MOORE, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at 408 California Street.

JOHN RICHARDS, Pres. PROF. FRANK SOULÉ, Vice-Pres.
OTTO VON GELDERN, Sec. JAS. SPIERS, Treas.

THE regular monthly meeting of the Technical Society of the Pacific Coast was held Friday evening, June 6th. A paper on logarithms was read and illustrated by Prof. R. Stringer of the University of Berkeley.

C. D. Harvey of this city exhibited samples of a new style of coupling for water and steam pipes. These couplings are made with shoulders on the inside to form a smooth flush surface on the inside of the pipe to prevent eddies in the flow of water or steam through the pipes.

At the next meeting the electrical storage company will exhibit the working of their apparatus.

P. J. Flynn, C. E., will read a paper on open drainage.

The society is now in a very satisfactory condition, and is constantly initiating members from all over the Coast.

THE regular monthly meeting of the San Francisco Chapter A. I. A., was held Friday evening June 13th. President Babson in the chair.

Architect Frank Shea was unanimously elected a fellow member.

An application was received from Herbert G. Lowry to become a student member, referred to a committee consisting of Cuthbertson, Sanders and Everett.

The committee appointed at a former meeting to procure papers to be read and subjects to be discussed by the Chapter reported that a syllabus had been prepared, and that the subject of the paper for the July meeting will be *The Scroll, the Star and the City*, by W. J. Cuthbertson. Other papers will be announced in the order in which they will be presented, and notice given in these columns previous to the meetings.

The committee appointed to decide on the merits of the drawings in the competitions of the A. I. A. Sketch Club reported first mention to S. C. Benson, second to H. J. Van Vlack, third to J. W. Rowell. Report accepted and committee discharged. A new committee consisting of Bugbee and Bestor was appointed to adjudge the mentions in this July competition on the subject of a wrought iron gate.

Mr. Sanders read the following paper elaborating an idea advanced by him at a previous meeting, looking to the erection of a commodious building for the accomodation of artistic and professional kindred societies.

MR. PRESIDENT AND GENTLEMEN: The subject of a "Home for the Professional Artisans," if such a term is admissible has, for many years past, in one form or another engaged the professional mind. If I err not the Grand Opera House was at one time intended as such a home.

Preceding that I remember early in the 70's, some scheme looking in the same direction, and only a few years since Col. Mitchell of the Ichi Ban interested the late Charles Crocker in a scheme which was brought to within an ace of realization, looking to a home for the Art Society as well as musicians, painters, architects and other allied professionals. This scheme included a small but very carefully arranged Opera House in the programme, and it was perhaps well that it was not finally consummated, as under the circumstances the whole enterprise would have been very likely to come to grief.

But aside from all previous schemes the object of the present paper is briefly to examine a few of the reasons for supposing that were a scheme of the sort realized under favorable conditions it might possibly be a success.

In the first place—beginning with our own profession—among the seventy or more architects, styled and self-styled, as well as recognized by the profession generally as entitled to that honorable designation, may we not reckon on at least one-third of them as properly embraced in the latter category and who could be regarded as *reliable* for proposed tenants? Then among the artists similarly classified, may not a similar proportion be found even if the members may not be represented as more than half as large. Then there are the engineers, a body of men second to none in respectability and solidity; then there are the engravers, photographers and others less intimately allied with the artistic professions and not forgetting the vigorous cult of sculptors and the ubiquitous and versatile decorators, carvers, professional house furnishers, etc., far too numerous to mention specificially. In view of all these different classes as constituency, is it not just within the possibility of fact that there may be in the neighborhood of one hundred good and true men in the professions allied to the arts of design, who could be reckoned on as a permanent corps of tenants for a building devoted to, and constituting a home for the Muses.

In connection with such a home, constituting an essential part of it should be an auditorium of moderate capacity so designed as to be appropriate, not only for lectures and public exhibitions, but as well capable of being used as a concert room though this should be regarded rather as a subordinate than as a primal qualification; and merely for the purpose of making the room remunerative when unused for other and more specially artistic purposes of a graphic character. One of these would be the holding of art exhibitions and for art auctions and sales, photographic exhibition and for the School of Design, for which also properly arranged class rooms, art rooms, life school and gallery would constitute a prime feature. Then the series of *artist's studios*, should be so arranged as to form *a suite* connected with one another at pleasure as well as with the art rooms of the school. The architect's ateliers should form another series similarly connected with a small gallery which could be devoted to the exhibition of competition drawings—or with the gallery of the hall itself and so on throughout the building, all being arranged with special regard to the needs of each class of tenants so as to render it as it were a sort of "*sine que non*" an absolute necessity for one who wished in any way to be in the *Swim*.

Then occupying the street levels should be arranged stores especially adapted to the exhibition and sale of artistic goods. Such stores as those of Shreves', Nathans', Colonel Andrews' Diamond Palace and others of like nature. Vickerys' Etchings, Rare books, and art stores proper, of which Morris & Kennedy's remains, I believe, now the sole representative, of those in which an art gallery is combined with the store proper.

Such a building could easily be made to occupy a corner 50 vara, and if furnished with wide entrances, elevators and all modern appliances and carried at say from five to eight stories in height could hardly fail, it would seem, to prove successful. Such a project brought in a practical way to the notice of some capitalist of ample means should readily meet with his approval and support.

After transacting the routine business the meeting adjourned.

A. I. A. SKETCH CLUB.

THE A. I. A. Sketch Club which was formally organized May 13, 1890 with twelve members on the roll, held their regular monthly meeting on Thursday evening June 12th, in the rooms of the San Francisco Chapter A. I. A.

Three applications were received for membership.

The June competition on the subject of a *Wrought Iron Gate* was closed and the snbject chosen for the July competition was *A Hall Clock*.

The officers of the Club are R. H. Wetmore, Jr., President; S. C. Benson, Vice-President and H. J. Van Vlack, Secretary and Treasurer.

All communications are to be addressed to the Secretary, room 94, Flood Building.

RULES AND REGULATIONS
OF THE
A. I. A. SKETCH CLUB,
OF
SAN FRANCISCO, CAL.

ARTICLE I.

NAME AND OBJECTS.

1. The name of this organization shall be the A. I. A. Sketch Club, of San Francisco, California.

2. The object of this Club is to promote the professional knowledge of its members, and to facilitate their intercourse and good fellowship.

ARTICLE II.

OFFICERS.

1. The officers of the Club shall consist of three members of the Club, elected at the annual meeting, namely: President, Vice-President, and Secretary and Treasurer.

ARTICLE III.

MEMBERSHIP AND BALLOTING.

1. The membership to consist of students only, employed in the offices of members of the San Francisco Chapter of the American Institute of Architects.

2. Persons desirous of becoming members may be proposed in writing by one member of the Club in good standing, and if no objection is made, referred to the Investigating Committee appointed by the President, and if favorably reported on by said committee, may then be ballotted for at next regular meeting.

Two black balls will reject such membership; application can not be renewed for a period of three months.

ARTICLE IV.

RECEIPTS AND DISBURSEMENTS.

1. The initiation fee to be $1.00 and the monthly dues $.25 payable in advance to the Treasurer of the Club.

Members delinquent in dues at the time of the annual meeting will be dropped from the roll.

2. Expenses to be paid by vote of the Club.

ARTICLE V.

MEETINGS.

1. Regular monthly meeting to be held the Thursday preceding the second Friday in each month, for the transaction of all business and for lectures, etc., which may be arranged for said meetings.

2. The annual meeting to be held on the Wednesday preceding the second Friday in December.

3. The exhibition to be held one week following.

4. Special meetings called by President attested by Secretary.

ARTICLE VI.

COMMITTEES.

1. Auditing and Investigating Committees to consist of two members each appointed by the President.

They shall report in writing on such business that they perform, at the regular meeting following their appointment.

2. The President may appoint committees from time to time as may be found necessary.

ARTICLE VII.

AMENDMENTS.

These rules may be amended by a two-thirds vote of the members voting at a regular meeting, such amendment having been proposed in writing, at a previous regular meeting.

ARTICLE VIII.

QUORUM.

1. A quorum in the Club to consist of one-third of the members on the roll in good standing.

2. Any member who absents himself from all the class and business meetings of any month without notification to the Secretary shall be dropped from the roll.

ARTICLE IX.

COMPETITIONS.

1. To be held monthly upon such subjects as shall be decided by the Club, monthly.

All drawings to be delivered flat and in non de plume to the Secretary on or before the evening of the regular monthly meeting.

ARTICLE X.

Any Parliamentary question which may arise, not covered by these rules, will be decided in accordance with Roberts' Rules of Order.

ARTICLE XI.

1. Every member of this Club shall sign a manuscript copy of these rules and regulations.

AMENDMENT TO THE FIRE ORDERS.

A subscriber asks for information concerning the recently enacted orders relating to fire escapes and metallic stand pipe. Following is the full text of the new order and the date of its passage:

ORDER NO. 2203.

Amendatory of Section 18, Order 1917, to define the fire limits of the city and county of San Francisco, and making regulations concerning the erection and use of buildings in said city and county.

The people of the city and county of San Francisco do ordain as follows:

Section 18 of Order 1917 is hereby amended to read as follows:

[FIRE ESCAPES, STAND PIPES, IRON DOORS AND SHUTTERS.]

SECTION 18. Every building occupied above the second floor from the level of the street by two or more families, and every building occupied as a tenement, boarding or lodging house, or for a factory, mill or manufactory, or for offices or workshop, in which persons are employed above the second floor, and every school building more than two stories in height, shall be provided with suitable facilities for escape in case of fire, to be kept in good repair at all times and free from all obstructions, and sufficient for the safe egress, in case of fire, of all the persons usually employed in or frequenting the building.

Every building hereafter erected of four or more stories in height in the city and county of San Francisco shall be provided with one or more metallic ladders or fire escapes, with balconies and railings to extend in front of and to communicate with one window in each story, extending from the first story to upper stories of such buildings, to four feet above the roof.

They shall be of such location and numbers and of such material and construction as the Board of Fire Wardens of the city and county of San Francisco may determine. After such determination shall have been made, as aforesaid, any member of the said Board of Fire Wardens may, at any time, by a notice in writing served on the owner, agent or lessee, of any such building, by leaving with such owner, agent or lessee, or at his, or her, or their residence, or place of business, a copy of such notice, to cause such metallic ladder or fire escape to be placed upon such building, within thirty days of serving such notice.

Provided, however, that all buildings more than two stories in height used for manufacturing purposes shall have one metallic ladder or fire escape for every twenty-five persons or less employed above the second floor. In case such owner, agent, lessee, or either of them, so served with the notice aforesaid shall not, within thirty days after the service of such notice upon him or them, place or cause to be placed such metallic ladder or fire escape upon such building as required by this section and the terms of such notice, he shall be subject to a fine of not less than twenty-five dollars or more than five hundred dollars. And to a further fine of fifty dollars for each week of such neglect to comply with such notice after the expiration of the said thirty days.

Every building of four stories or more in height situated in the city and county of San Francisco shall have a four-inch metallic stand pipe outside the front wall, extending from four feet above the line of the sidewalk to four feet above the roof, and at each story there shall be proper branches with gate valves, and there shall be a siamese inlet four feet above the line of sidewalk, and a siamese outlet at the end of pipe over the roof, with gate valves attached, all to be made of proper dimensions to connect with the hose used by the Fire Department. All valves to open and close as the Chief of the Fire Department may determine.

All owners, occupants or the person or persons having control of any building on which iron shutters are placed shall leave all such iron shutters above the first story opened, and fitted so as the firemen can readily close them when needed to protect the building from fire. All iron doors and shutters to openings on the first story of any building shall be hung on hinges, and the locks shall be so arranged as to admit of easy destruction by the Fire Department or Fire Patrol; provided, that all iron doors or shutters shall be securely fastened in the wall or be hung to an iron frame. This shall apply to all iron doors or shutters in the front, on the sides or in the rear of a building, and in no case shall all the iron doors and shutters of a building be fastened from the inside, but at least one of such doors in the front, on the side and in the rear shall be fastened with a lock as above described.

No gratings or bars of iron, wood, brass or other material shall be either temporarily or permanently placed, fixed, built or maintained in the walls or framework of any brick, stone or wooden building in this city and county, in the basement, or in any story or portion of any story of any building, or in the openings made for affording access or exit to or from any building, or in any space or opening for affording light or air, or in any opening made in any building for doors, windows or other purpose, without permission of the Board of Supervisors.

In Board of Supervisors, San Francisco, April 7, 1890.

After having been published five successive days, according to law, taken up and passed by the following vote:

Ayes—Supervisors Bingham, Wright, Boyd, Pescia, Bush, Ellert, Wheelan, Pilster, Kingwell.

Absent—Supervisors Becker, Barry, Noble.

JNO. A. RUSSELL, Clerk.

Approved, San Francisco, April 16, 1890.

E. B. POND,
Mayor and ex-officio President Board of Supervisors.

WE would call the attention of our readers to the vast field covered by advertisers in this journal. Any person desiring to know about the newest and latest improvements and inventions relating to building and construction and the materials and process employed, and where to go to procure the best goods of standard makers, has only turn to the index of our advertisers and read the matter therein contained to find information that no end of personal correspondence would be required to collect.

The majority of architects consign a circular to the waste basket as soon as received, often without troubling themselves to remove the contents from its envelope. We know from long experience that when they desire information on any particular subject, they turn to their trade journal, and in its well arranged columns find the particular circular they want, properly indexed and accessible at a moment's notice, which is a great convenience and saving of valuable time, as a busy architect cannot well spare the time to hunt through piles of circulars in search of a certain one, which perhaps has not been kept after all.

The moral of this is to advertise where it will do the most good and receive the most attention, and we will say that space in our columns is becoming more and more sought after by shrewd business men, who are not slow to recognize the truth of this proposition when placed before them.

The fact that our advertising columns are becoming more and more crowded with interesting matter and will soon have to again be increased in number, is one that should be considered by every firm or individual who has articles to introduce to public attention and who wishes to do so in the most direct and economical manner.

THE San Francisco Art Association desires to call the attention of the public in general, and of all those desirous of obtaining an art education, to the opportunity afforded by the California School of Design.

This Association has rooms at 430 Pine Street, that are large and perfectly adapted for the purposes they serve. There are three sessions yearly, each term three months in length, beginning on the first Mondays in January, May and September of each year.

There is at present a new arrangement in force designed for the benefit of teachers in the public schools, who may attend the Saturday class throughout the year.

TESTS OF BUILDING STONES.

IN THE course of an exhaustive paper on this subject, Mr. Maddell describes in their proper order the various tests to which building stones are usually subjected:

1. The soda test.—In order to obtain satisfactory results from this test, at least eighteen cubes of each kind of stone to be tested would be required. They should be either 2-inch or 2½-inch cubes—probably the former would be better—as the 3-inch cubes are rather bulky. Six cubes should be thoroughly dried, then broken in a testing machine so as to obtain an average resistance to crushing. If the stone be of uniform quality, these six specimens would give a fair average, provided that the manner of manipulation in the machine were uniform, as it should invariably be; but if the quality vary decidedly in the different specimens, the number of the latter, both treated and untreated, should be increased.

The remaining twelve or more specimens of each kind of stone, after being distinctly marked, should be boiled twice a day for an hour at a time in a concentrated solution of sulphate of soda for fifteen days, at the end of which time the specimens should be tested, the boiling process being continued on the remaining process fifteen days longer. Before crushing, each treated specimen should be thoroughly dried.

To dry the stone, first keep them in a warm place for two days, then just before testing, place them in an open air bath for two hours, so as to drive off any moisture that may have been absorbed. Of course, if the specimens can be kept in a warm place until ready to put in a testing machine, the use of the air bath can be dispensed with. The main object should be to have all the specimens tested exactly alike.

There should be not less than three different kinds of stone represented in this test in order to obtain comparative results; and the more that is known concerning the qualities of the reference stones, in respect to their action when in actual use, the better.

One might suppose at first thought that the greater porosity of the stone, the greater the effect of the crystalization, but such is not the case; for if the pores were large and constituted a large portion of the mass, there might be room for the crystals to form without displacing any particle of the stone. The writer is led to conclude that such may be the case by the fact that the sulphate of soda manipulation appeared to have no deteriorating effect on Warrensburg sandstone, which is very porous in comparison with limestone.

2nd. The freezing test.—Judging by the experiences obtained in making this series of tests, the conclusion has been reached that the employment of a freezing mixture is practically useless for various reasons. First, if special arrangements be not made to prevent radiation, it will be found impracticable to obtain the lowest possible temperature that can be produced from the mixture, and even if it could be reached, it could not be retained for more than a few minutes at a time. Again, a long continued alternation of freezing and thawing is necessary to produce any appreciable effect; and as the process is both tedious and expensive it would be better to employ a simpler and more effective one.

The method of conducting the test referred to would be as follows:

At least eighteen 2-inch cubes of each kind of stone to be tested would be prepared, one-third of the number being broken after a thorough drying in order to determine the crushing resistance of the untreated stones. Two or more flat wooden boxes with covers, divided into cubic compartments to contain the specimens would be prepared, provision being made to draw off all the water that might otherwise collect in the boxes. Each specimen before being placed in its compartment, would be accurately measured and weighed, after being thoroughly dried.

The boxes, when filled, would be covered and locked; then about the beginning of cold weather would be sent to a reliable person in some cold climate for manipulation. This would consist in first soaking the stones in water, then alternately freezing and thawing them daily throughout the entire winter, one box being drained before freezing, and the other being frozen in a pan of water. At the end of the winter the boxes of specimens would be returned, then each stone, after thorough drying, would be weighed and crushed, thus determining the loss of both strength and weight due to the treatment.

3rd. Absorption test.—This, although a very useful and satisfactory test, should not be considered a conclusive one in respect to the suitability of a stone for building purposes; for it is possible that a stone which absorbs but little water may deteriorate more quickly than another stone that absorbs considerably more water.

4th. Fire test.—This is a good test, but as in the last case, is not conclusive; for a stone that will stand it is very probably good for building purposes, while one that fails under it may or may not be unfit for the same. It is possible that if a more moderate heat were to be employed than that used in making the tests just described, the results would be more distinctive and satisfactory. It would be well to the effect of repeated heating and sudden coolings, the temperature employed being constant, continuing the tests until all the specimens be rendered worthless, and noting how each specimen bears the treatment.

5th. Abrasion test.—No more impartial or convincing test than this could be devised, for the specimens of various kinds of stone are all treated at the same time and are subjected to exactly the same conditions. The results show indubitably the order in which the various stones resist abrasion combined with impact, such as that to which bridges and piers are subjected by floating ice and trees. It is barely possible, though, that after a number of years in actual use in bridges and piers, the stones, when subjected to this test, would indicate a different order of resistance.

For abrasion pure and simple without impact, a grindstone test would be conclusive. In this each specimen should be held by a constant pressure for a certain time, against a grindstone run at a uniform velocity by machinery. Then, if the specimens be of exactly the same dimensions, the percentages of weight lost by the grinding will indicate the order of resistance.

6th. Crushing test.—This, the most common of all tests, for stone, cannot always be relied upon to give even comparative results, unless all the tests considered, were made in precisely the same manner. The time element is the most important factor, because a specimen when tested rapidly, may indicate a greater strength than it would if tested slowly. Then again, it is a matter of judgment as to the exact period of the test, when the specimen may be said to fail the kind of crushion employed (or substance interposed between the specimen and the machine) will materially affect the result. Lead, which was commonly employed a short time ago, has fallen into disuse. Its effect appears to be a splitting of the stone, caused by flowing of metal into the irregularities of the compressed surfaces, tbus indicating a lower resistance than would otherwise be developed. A thin layer of plaster of paris gives the best and most uniform results; nevertheless the water used in mixing it acts as a disturbing element by soaking into the stone when squeezed out of the plaster by the pressure. Pieces of blotting paper placed between the stone and the plaster of paris reduce the effect of this disturbing element.

As a rule it requires more tests than are ordinarily made upon any one kind of stone, to determine its average resistance to crushing, as even the most homogeneous appearing stones vary materially in strength when subjected to this test. Again, the dryness of a specimen will effect its crushing strength. Each kind of stone should be tested when both are thoroughly dry, and when saturated, and enough specimens should be broken in each case to determine a reliable average.

A knowledge of pressure a stone will bear when thoroughly soaked in water, is very desirable for an engineer, when dealing with masonry below water line.

7th. Specific gravity test.—The making of this test is a comparatively simple matter, especially as no extreme accuracy is required. It will suffice to measure carefully all the dimensions of a number of cubes, and to weigh the latter without drying them; the weight per cubic foot will be found to vary from one to three pounds on each side of the average, the amount of variation depending upon the homogeneity of the stone, a small variation being a good characteristic, in that it indicates uniformity of composition.

8th. Microscopic test.—This test, which, as applied to building stone is quite new, is said by good authority to be the best of all tests for stone. It requires to be made by one who is a specialist in both lithology and microscopy.—*Stone.*

THE sensation of the past few days in building circles, is the discovery that portions of the walks and piers of the McAllister Street wing of the New City Hall have been stuffed with rubbish, instead of being the solid, massive masonry they appear to be, and were supposed to be by the public and the City Hall Commissioners. The newspapers have made much of the affair, and given the impression that the contractors would have benefitted largely by the frauds, had they not been discovered.

The contractors claim that the inferior work was done by a single vicious mechanic, who attempted to blackmail them, and being unsuccessful, vented his spite by informing the authorities of the poor work done.

The expert appointed to examine the whole work, reports that by taking down and rebuilding certain piers and arches the injured portions can be put in proper condition to safely carry the weights they were designed to support.

It would appear to a casual observer, that a deliberate attempt at a fraud of this nature would be unsuccessful from the fact that so many men must of necessity be aware of the doings, as to render it impossible to keep the matter secret. Such does not appear to be the case, however, as others besides the mechanics employed on the job claim to have been aware of the state of things, but did not concern themselves sufficiently to take the trouble to inform the proper officials, and it remained for a discharged mason to bring the affair to light.

WHERE is now every probability that Market Street will be extended in a straight line to the Pacific Ocean.

It will be a most important improvement, and by giving access to a large tract of land at present quite inaccessible, cannot help but be of great benefit to the property in the locality it opens up.

MODELS of the four competitive designs for the City Hall statuary to beerected by the Lick Trustees, have been submitted. This is the second attempt at securing a competitive design worthy of execution; the first resulted in a fiasco, as is usually the case when a building committee, public officials, or private individuals attempt to secure *something* for *nothing*.

The management of this journal desires to extend a cordial invitation to all Architects on this Coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

Through the kindness of architect T. J. Welsh, we are enabled to give the plan and elevations of the New Supreme Court building, which is now being erected on the northwest corner of McAllister and Larkin streets. J. P. Hale is the owner.

The building fronts 120 feet on Larkin and 137 ft. 6 in. on McAllister street and is five stories in height besides the attic story. The fifth story and the attic will be used by the Supreme Court. The other stories will be utilized for office purposes, and the first floor for stores.

The materials employed are concrete, brick, and iron; the fronts are of pressed and stock brick, granite, San José sandstone and terra cotta. The building will have all modern improvements, and will cost about two hundred and fifty thousand dollars.

The perspective drawing of St. John's Church is from the designs of the architect E. A. Coxhead, The church will be erected near Valencia and Fifteenth streets in this City.

DRAWINGS FOR REPRODUCTION.

Architecture and Building for May 31, gives some excellent advice to draughtsmen and designers, on the requirements of drawings designed for reproduction, which we reproduce below:—

The art of drawing for reproduction like every kindred art has been steadily advancing. We have been repeatedly asked to indicate the principles upon which such work is done. Most of the drawings which are reproduced in our plates are very much larger in the original than in the reproduction, this fact necessitates a study of the effect of reduction upon the reproduced design.

Some draughtsman imagine that the larger the drawing and the blacker it is the better will be the reproduction, but the results are sometimes sadly disappointing. When a drawing is on a large scale, the light lines are reduced in width to such an extent as to appear to be mere scratches on the paper. If a drawing be on paper larger than 21in.x32in. all the lines should be course or heavy, widely spaced, for a fine line would simply be reduced out of sight, or lines too near together would be blurred into a confused mass of inkness. Some of our finest draughtsmen endeavor, to get in an effect of perspective distance by means of lines of uneven intensity, beginning with great firmness and depth of black and fading or vanishing into a thin gray line. This method may be well enough for a design in a pictorial sense, but if it is to be reproduced the thin gray line becomes a series of straggling dots, and as a consequence, have no visible expression. There are, of course, exceptions to this general statement. Some of our readers who have had the pleasure of seeing the original pen-and-ink sketches of Mr. E. A. Abby or Mr. J. C. Stevens, will recognize the distinction we have in mind. These men have had many imitators, but few have been successful. An analysis of their work will show that no matter how finely drawn their lines may be they are firmly drawn, with a touch that is as bold or vigorous as it is delicate, and that their meaning has been thought out before being drawn, and because the delicate, beautiful pen work tells its story so well is only another proof that in art nothing is impossible. This method, however, is so exceedingly difficult, it is a method that is naturally so innate in the man's sense of touch that we feel it is a touch which cannot be acquired, and we cannot urge its cultivation for reproductive purposes. No matter how artistically shaded and cleverly rendered a drawing may be, if there is any trickiness in the apparent effect of the original, the camera catches the deception and exposes it in the reproduction. Cross-hatching in an architectural perspective becomes under reproduction a mere succession of blots run together, and give an effect of slovenliness.

Photo engraving and photo lithography are coldly mechanical processes, and permit of fine effects only by a studied gradation in width of line. As to the printing, every full, clear line printed has the same intensity, if apparently the intensity varies it is because the line has been weakly drawn. If contrast of light and dark are wanted in a reproduction the effect can be obtained only by a nicely calculated spacing and thickening of the line on the original; it cannot be produced by a variation in the intensity of color, of say two or more lines of equal thickness. In such an event the reproduction appears spotty or thin. If bright lights are wanted they can be obtained only by leaving the paper perfectly bare of lines at the points that the brightness is wanted. In our issue of May 10, a cottage at Baychester illustrates how very clearly and how strongly a drawing may be rendered to bring out an effect of vivacity and vigor. It will be no-

ticed that some of the lines on the roof appear to be weak and faint. This may be due to an oily surface on the paper at that point, causing it to refuse the ink, or it may have been due to too light a touch or lack of firmness in drawing the lines. On the roof of the porch the same defect is observable, but outside of that the drawing is clearly and firmly rendered, and tells its story in the best manner possible. One of the great difficulties to be overcome in drawing for publication is to obtain good ink and good paper. If the ink be too thin and flowing, it leaves a weak line on the paper that in its turn is weakened by reproduction. If the paper is bibulous it absorbs a portion of the ink into its pores, spreads it out and blurs the line. The ink should not be thick, otherwise it will be impossible to obtain a fine line. The best paper in the world to draw a perspective on is a hard surfaced bristol board: next to that is a hard finished bond paper. Tracing cloth will not take ink well on either glazed or dull side, and should not be used for perspectives that are to be reproduced. Lately we have seen a very fine French parchment, which has been imported by some of our Western architects, that takes the ink in an exquisite manner, and which is capable of receiving a hard rubbing without the destruction of its texture. The principal features to secure are: first, clearness of line at every point; second, brightness of effect by judicious disposition of the shades and shadows; third, a clear understanding of the effect desired, accompanied by a firm and bold rendering; and fourth, avoid delicacy of treatment, as it is apt to degenerate into a weak, unpictorial drawing.—*Architecture and Building.*

We give elsewhere the rules and regulations of the A. I. A. Sketch Club, organized under the auspices of the San Francisco Chapter A. I. A. The subject of their first competition was the decoration of a frieze and the three designs adjudged to be the best are given in the order of their mention, on our first page of lithographs. We regret that the second design could not be well reproduced as drawn, as it exhibited very careful draftsmanship and was shaded to perfection, but was not suited for reproduction by photo lithography, aud so we were compelled to render it in line, which does not do justice to the work on the original. (In another column we give a description of some of the requirements of drawings designed for reproduction taken from *Architecture and Building*, and would call the attention of all draftsmen to the article, who have work of this description, as containing many valuable hints.

(This journal is not responsible for the opinions of its correspondents.)

THE LELAND STANFORD JR. UNIVERSITY VIEWED IN AN ARTISTIC AND UTILITARIAN LIGHT.

To Editor California Architect:

Sir:—The Leland Stanford Jr. University has progressed sufficiently now for us to judge somewhat of its appearance and fitness for its purposes.

The first thing that strikes one as one approaches is the effect of its being in a basin—being a low one-story building adds to the low effect—however, being a quadrangular building it would be no doubt awkward to build it on the slope of the hill at its back, although the first impression is considerably marred by its depression. Getting nearer the effect is better, especially when one gets into the quadrangle where the arcaded cloisters cannot but be effective in any case. The detail of the caps of the columns, however, is very poor, no life or vigor exhibited in the carving. The plan is excellent and the one-story arrangement as a college ought to be. The two deep stone transom bars at each window is a serious objection in respect to cutting off the light, and it is an open question whether there will be sufficient light in the center of the class rooms for work. Light is life and should not be sacrificed to monumental effects.

Coming to the residence building we find a different principle permeating it, and many stories predominate instead of one. We fail to find the *raison d'etre* of a five-story dormitory building in juxtaposition to a one-story class room building. It seems very ill-advised to put a building of so many stories up where there is so much ground to build upon, and unnecessary stairs, especially as the stairs have not an easy step. The ceilings of the studies and bedrooms are also altogether too low for California, being only 9 feet high in the upper stories.

These defects are excusable in the case of Eastern architects, but would not be tolerated in California ones. Those that come to live here, in a few years get, as it were, acclimatized, and then put up fine and suitable buildings. Until such time it is well not to experiment with exotic designs, especially for permanent public and monumental buildings.

In effect again the large five-story building completely dwarfs what should be the most important building, viz., the college proper, and the glaring monotonous color of the stone used does not add to its beauty.

The roof tiles being very thin do not look substantial enough for the substructure—the old fashioned thick pan tiles would have, no doubt, been more suitable, although heavier.

Yours, etc.,

Stroller.

Seattle, Wash., May 10th.

California Architect and Building News:

Gentlemen:—I would be much pleased if you would insert an item in your paper for your advertisers to mail me their circulars and price lists. Yours very truly,

W. Luff Meredith.

Miss Minerva Parker, we believe, is the only woman in America actually practicing the profession of Architecture. Her office is at 14 South Broad street, Philadelphia. She proposes for the present to confine herself to domestic architecture, and has already satisfactorily designed and executed a number of residences and dwellings. Though she encountered many difficulties in obtaining the necessary knowledge, training and experience required to establish herself in business yet she has found her sex to be no obstacle to her advancement, and has received words of encouragement both from members of the profession and the public. A preliminary sketch for a cottage designed by Miss Parker appears in the May number of the *Journal of Building.*

The Pittsburgh Master Plasterers Association have established the following schedule of prices for the year 1890:

Common plaster, 32 cents per yard; adamant plaster, 50 cents per yard; wire lething, 65 cents per yard; running cornices, 25 cents per foot; cementing, one coat, 75 cents per yard.

Fire and Water for May 31st, contains the proceedings of the tenth annual convention of the American Water-Works Association. Among other valuable and interesting papers read and discussed was one by Mr. Le Conte on "Contamination of waters in certain storage reservoirs on the Pacific Coast and the palliatives resorted to." He describes in detail the causes of the putrefaction of vegetable and animal matter, contained in reservoirs during the summer months, and suggests methods of purifying the stored waters and preventing contamination.

THE ENGINEERING AND BUILDING RECORD in its issue of May 31st has a paper by J. Nelson Tubbs on a method to be employed in determining an equitable schedule of water rates for cities and towns.

HOUSE PAINTING AND DECORATING is endeavoring to get Congress to pass a law making it a misdemeanor to falsely label any pigment or oil. We hope it will succeed. If consumers wish to use impure materials they are at liberty to do so, but they should not be deceived into buying adulterated stock under the impression that it contains nothing but pure ingredients.

THE SANITARY PLUMBER suggests that as subway tunnels will become a necessity in the near future for such cities as New York, that the proper authorities should take time by the forelock, and by investigating the subject from all points, ascertain the best form, the proper size, and all other necessary information as will enable them to decide intelligently when the time comes for a decision.

ARCHITECTURE AND BUILDING of May 10 contains the designs for the Grand Stand at Monmouth Park, N. J. There is some dispute as to who is entitled to the credit of designing the large projecting roof, as well as who originally supplied the idea, several parties claiming credit therefor. The articles on Roman Architecture by Prof. Atchison are continued.

SEMI-ANNUAL SUMMARY OF BUILDING OPERATIONS.

The first six months of this year has not been as prosperous as the indications at the beginning of the year promised. Many of the larger contracts of contemplated improvements having been postponed or altogether abandoned for reasons well understood. By a comparison with former years the contracts filed foot up less than for last year.

CITY BUILDING NEWS.

Brick work. Owner, Easton, Eldridge & Co.; architect, P. R. Schmidt; contractor, Richard McCann; cost, $4,440; signed, May 22; filed, May 24; payments first and fifteenth day of each month.

Broderick and Oak. Two-story frame; owner, Julia S. Cohn; architect, M. J. Welch; contractor, S. Sarivee; sureties, C. G. Butler and H. Ramillard, $3,000; cost, $3,900; signed May 9; filed, May 13; payments, $975, framed; $975, brown mortared; $975, completed; $973, 35 days.

Bush and Fillmore. Alterations; owner, Jas. Boyd; architect, M. J. Welch; contractor, J. E. McDonald; sureties, J. H. Kruse and J. Rothman, $4,000; cost, $4,090; signed, May 7; filed, May 9; payments, $570, first floor joists set, $500, brown mortared; $1,000, white mortared; $1,000, completed; $1,090, 35 days.

Brannan and Second. Brick and wrought iron work; owner, J. R. Tobin; architects, Huerne & Everett; contractor, Geo. D. Nagle; cost, $3,980; signed May 3; filed, May 5; payments, $1,000, basement walls up; $1,985, completed; $995, 35 days.

Brannan and Second. Carpenter work; owner, J. R. Tobin; architects, Huerne & Everett; contractor, F. Buckley; cost, $9,000; signed, May 3; filed, May 5; payments, $2,250, roofed; $2,250, brown coated; $2,250, completed; $2,250, 35 days.

Bush and Laguna. Two-story building; owner, S. Baker; architect, John Gash; contractor, A. L. Campbell; cost, $7,050; signed, May 31; filed, June 2; payments, $881, brick work done; $881, brown coated; $881, white coated; $881, doors and windows hung; $882.50, completed; $1,762.50, 35 days.

Bush and Central Ave. Two-story frame building; owner, Will Dodson; architect, A. Smith; contractor, G. G. Gillespie; cost, $2,950; signed, May 27; filed, June 6; payments, $553, framed; $553, brown coated; $553, white coated; $553, completed; $738, 35 days.

Clayton between Page and Oak. One-story dwelling; owner, F. Bryan and wife; contractor, H. Lehouse; cost, 90 days; signed, May 25; filed, May 27; payments, $800, framed: $700, brown mortared; $784, completed.

Castro and Sixteenth. Owner, F. Likens; contractor, Barrbee & Fryer; sureties, A. Christensen and E. Lord; cost, $3,444; time, 75 days; signed, May 30; filed, May 30; payments, $645 75, chimneys up; $645.75, floors laid; $647.75, brown coated; $647.75; completed; $867, 35 days.

Clara Ave. and Eighteenth street. Two-story frame; owner, Wm. Menser; contractor, Jas. Campbell; cost, $1300; time, 40 days; signed, May 20; filed, May 21; payments, $487.50, brown coated; $487.50, finished; $324; 35 days.

Castro between 14th and 15th. Frame; owner, Jno. McDonnell; contractor, S. D. Matthews; sureties, J. W. Wesson and Chas. Matthews, $4,400; cost, $4,400; signed, May 22; filed, May 23; payments, $1,000, framed; $1,000, window and door frames set; $1,500, completed; $900, 35 days.

Clement and Eighth Ave. Carpenter work; owner, Wm. N. Baronsfeather; architect, A. Steubibi; contractor, Cook and Wry; surety, Thos. Richardson, $1,000; cost, $1,950; time, 20 days; signed, May 12; filed, May 13; payments, $475, framed; $475, lathed; $500, white coated; $500, 35 days.

Diamond street. Carpenper work; owner, J. C. Scott; contractor, Jos. W. Fish; sureties, Blyth & Trott; cost, $1,360; time, 60 days; signed, May 5; filed, May 8; payments, $500, brown coated; $300, white coated; $220, accepted; balance, 35 days.

Devisadero and Oak. Two-story frame buildings; owner, J. Lutgens; architects, John and Balezynski; contractor, F. W. Kern; cost, $11,740; signed, June 3; filed, June 3; payments, $2,200, framed; $2,200, enclosed; $2,200, rough mortared; $2,200, ready for painting; $2,940, 35 days.

Devisadero and Oak. Brick and stone work; owner, J. Lutgens; architects, John & Balezynski; contractor, F. Wagner; cost, $2,289; signed, June 3; filed, June 3; payments, $1,200, foundation laid; $510, granite work done; $575, 35 days.

Ellis and Pierce. Carpenter work, etc.; owner, A. Summerfield; architects, Salfield & Kohlberg; contractor, Thos. Elain; surety, Chas. F. Doe and W. F. Meeker, $3,000; cost, $4,950; signed, April 29; filed, May 5; payments, $1,000, framed; $1,000, brown coated; $1,000, doors hung; $10, accepted; $1,240, 35 days.

325 Ellis Street. Alterations; owner, J. Ross; contractors, White Bros.; surety, F. Joost, $2,584; cost, $2,584; time, 60 days; signed, May 13; filed, May 13; payments, $1,200, third story ready for lathing; $784, completed; $2,484, 35 days.

Eddy and Levenworth. Two-story frame; owner, J. Molony; architect, M. J. Welch; contractor, J. Bruce; surety, Robt. Oxford and H. Williamson, $3,000; cost, $3,250; signed, May 7; filed, May 12; payments, $812.50, framed; $812.50, brown mortared; $812.50, completed; $812.50, 35 days.

Eddy and Franklin. Frame; owner, S. Goldstein; architect, Wm. Mooser; contractor, M. C Lynch; surety, J. H. Kruse and C. E. Gillon, $6 000; cost, $10,372; time, 150 days; signed, May 17; filed, May 20; payments, 75 per cent as work progresses; 25 per cent., 35 days.

Ellis and Pierce, Plumbing, etc.; owner, A. Summerfield; architects, Salfield & Kohlberg; contractors, S. Ochelheimer & Bro.; cost, $471; signed, April 26; filed, May 5; payments, $200, rough work; $151, finished; $120, 35 days.

Eighth and Mission. Owner, A. W. Manning; contractor R.R Rankins; cost, $8,000; signed, May 3; filed, May 5; payments, $500, foundations laid; $1,375, framed; $1,375, fronts in; $1,375, brown coated; $1,375, accepted; $1,375, 35 days.

Eddy and Franklin. Brick and iron work; owner, M. C. Lynch; architect, William Mooser; contractor, J. F. Wagner; cost, $1,393; signed, May 28; filed, May 28; payments, 75 per cent. of work done; balance, 35 days.

Fell and Laguna. Two-story frame; owner, Mary Berges; contractors, J. W. Mayden and G. W. Langhead; surety, F. T. Norman, $1500; cost, $3,500; time, 70 days; signed, May 19; filed, May 21; payments, $657, framed; $659, rooted; $656, brown coated; $656, finished; $875, 35 days.

Flint Tract. Four room cottage; owner, C. C. Bohnbacher; architects, Salsfield & Kohlberg; contractor, Jacob Klein; cost, $1,030; signed, May 3; filed, May 8; payments, $400, enclosed; $370, accepted; $260, 35 days.

Fell and Laguna. A frame; owner, H. Donnelly; architect, Wm. Mooser; contractor, W. H. Wickersham; sureties, D. F. Lewis and C. F. Holmes; cost, $6,200; time, 80 days; signed, May 23; filed, May 26; payments, 75 per cent as work progresses, 25 per cent, 35 days.

761 and 765 Folsom street. Brickwork; owner, P. G. Somps; architect, Geo. E. Voelkel; contractor, F. Hatt; cost, $1,032; signed, May 15; filed, May 23; payments, $765, second payment on contract is due; $265, third payment on contract is due as specified.

Folsom and Fifth. Two-story frame; owner, J. Canepa; architect, M. J. Welch; contractor, E. Piscasso; surety, A. J. Turner; cost, $1400; signed, May 14; filed, May 14; payments, $350, framed; $350, brown mortared; $350, completed; $350, 35 days.

Folsom and Second. Stable; owner Wells, Fargo & Co.; contractor, D. G. Crisholm; sureties, P. Connolly and Thos. Downing, $15,000; cost, $30,960; signed, April 21; filed, May 15; payments, 75 per cent. as work progresses; balance, 40 days.

Folsom and Moss. Two two-story frame buildings; owner, J. Eagan; architect, M. J. Welch; contractor, Brennan Bros.; cost, $5,310; signed, June 2; filed, June 5; payments, $1,327.50, framed; $1,327.50, brown mortared; $1,327.50, completed; $1,327.50, 35 days.

Guerrero and Twenty-fifth. Two-story frame; owner, M. Kinnery; architect, M. J. Welch; contractor, Sandy Gillogby; sureties, C. S. Holmes and Geo. Washington and Baker. Owner, A. Silverstein and wife; architect, H. D. Mitchell; contractor, W. A. Van Devort; surety, O. H. Greenwald and D. H. Bibb, $5,000; cost, $6,300; signed, May 24; filed, May 26; payments, $930, first story floor joists in place; $930, enclosed; $930, brown coated; $930, white coated; $930, accepted; $1,550, 35 days.

Washington and Steiner. Alterations and additions; owner, J. H. Meredith; architect, Chas. I. Havens; contractor, J. Furness; cost, $1,260; signed, June 3; filed, June 5; payments, $450, first coat of plaster is on; $460, entire work is finished; $350, 35 days.

York and Twenty-second. Plastering; owner, H. Ricke; contractor, Schultz & Curry; cost, $1,890; signed, May 14; filed, May 15; payments, $500, rustic on; $450, first coat of plaster on; $450, completed; $850, 35 days.

Oakland.

Mortuary Vault in St. Mary's Cemetery. Owner, Mrs. Annie McMenamin; architect, Chas. J. Devlin; contractor, D. Dwyer; cost, $1,728; time, 10 weeks; signed, May 12; filed, May 13; payments, to be paid 35 days after the entire work is completed.

Alameda and Oak streets. Two-story brick; owner, The Masonic Association of Alameda; architect, Chas. Man; contractor, J. H. Corey; cost, $31,250; signed, May 8; filed, May 9; payments, $5,814, ready for second story joists; $5,812, roofed; $5,812, brown coated; $5,812 completed; balance, 35 days.

Thirteenth and Twenty-third streets. Two-story; owner, J. Gillian; architect, R. G. Frise; contractor, J. C. Nelson; cost, $2,400; time, July 10, '90; signed, May 5; filed, May 7; payments $700, enclosed without rustic; $700, brown coated; $700, outside finish on; $700, 35 days.

Owner, First Unitarian Church of Oakland; architect, W. J. Matthews; contractor, F. W. Knight and Chas. Littlefield; cost, $17,973; signed, May 5; filed, May 19; payments, $2,695.65, two-fifths completed; $2,695.80, three-fifths completed; $2,695.95, four-fifths completed; $2,695.95, completed; $4,493.25, 35 days.

St. Charles and Railroad Ave. Cottage; owner, M. De Witt, architect, A. Stenbiht; contractor, G. A. Benseman; cost, $1,590 50; signed, May 18; filed, May 27; payments, $900, framed; $900, brown mortared $992, completed; $998, 35 days.

Isabella St. Owner, J. G. Brand; contractar, J. W. Brougham; cost, $1,620; signed, May 12; filed, May 19; payments, $450, ready for first coat of plaster; $850, ready for second coat of plaster; balance, 35 days.

Owner, J. A. Remmel; contractor, R. Gillis; surety, Wm. Dannheim and Thomas P. Frost, $6,000; cost, $6,975; time, 90 days; signed, May 20; filed, May 27; payments, $1,743.75, framed; $1,743.75, brown coated; $1,747.75, completed; $1,747.75, 35 days.

Lafayette and Railroad Ave. G. T. Wright; contractor, A. W ; cost, $2473; signed, May 26; filed, May 29; payments, 700 chimneys built; $650, brown mortar on; $600, completed; $623, 35 days.

Telegrapy Ave. and Twenty-sixth streets. Two-story frame; owner, J. Hutchison; architect, Wm. Kiok; contractors, J. E. Blethen and G. M. Walker; cost, $4296; signed, May 29; filed; May 29; payments, $1074, framed; $1074, first coat of plaster; $1074, completed; $1074, 35 days.

Haven and Peralta streets. Owner, James Holmes; contractors, H. Burns & F. J. Maurer; cost, $2,973; signed, May 2; filed, May 7; payments, $735, one-third built; $735, two-thirds built; $735, completed; bal, 35 days.

Adeline and Eighth. Two-story frame; owner, R. Abbey; architect, Wm. Kirk; contractor, P. F. Nelson; cost, $5,172; signed, May 15; filed, May 15; payments, $1,293, frame up and brick work done; $1,293, enclosed, window frames set and first coat plaster on; $1,293, completed; $1,293, 35 days.

Third Ave. and Twelfth street. Two-story frame; owner, J. P. Rynders; architect, Chas. Man; contractors, Trohig & Moore; cost, $7,824; signed, June 2; filed, June 4; payments, $1,956, ½ work, completed; $1,956, ½ work completed; $1,956, completed; $1,956, 35 days.

Dayton Ave. and Paret street. Owner, J. H. Bullock; architects, Townsend & Wyneken; contractor, N. M. Kirkwood; cost, $5,145; signed, May 28; filed, June 2; payments, $1 000, roofed sheathed; $1,400, brown coated; $1,458, completed; $1 287, 35 days.

East Oakland, between Fifth and Sixth Aves., Nineteenth and Twentieth streets. Additions; owner, B. M. Wakerly; architects J. J. & T. D. Newsom; contractor, Wm. G. Miller; sureties, J. Gregory and J. Ferguson; cost, $4,000; signed, May 15; filed, May 15; payments, $1,000, frame up and roof finished; $1,000, outside fin sh in place; $1,000, completed; $1,000, 36 days.

Alameda.

One-story frame; owner, Mrs. L. Rumel; architect, Chas. S. Shauer; contractor, D. S. Brehaut and J. Diamond; cost, $2,730; signed, May 24; filed, May 28; payments, $683.75, sheathing on; $683.75, brown mortared; $683.75, wood work done; $683.75, 36 days.

Owner, W. C. Rarig; contractors, Cameron & McDonald; cost, $3,000; filed, May 6; signed, May 28; payments, $750, framed; $750, brown mortared; $750, plaster completed; $750, 10 days.

Encinal Avenue and Union. Two story frame; owner, John Mutton; contractors, A. W. Pattiani & Co.; cost, $2,620; signed, May 17; filed, May 21; payments, $750, chimney built; $700, interior primed; $540, completed; $660, 35 days.

N. W. cor. Central Avenue and Lafayette Street. Frame; owner, F. W. Van Sicklen; architect, Clinton Day; contractor, C. A. Parker; cost, $1,684; signed, May 14; filed, May 21; payments, $2,000, roof sheathed; $2,500, interior ready for painter; $2,100, windows hung; $2,500, ready for painter; $548, completed; balance, 35 days.

Encinal Ave. and Pave St. Two-story frame; owner H. Molms; contractor, A. W. Pattiani; cost, $2,640; signed, May 7; filed, May 9; payments, $660, chimney on; $660, exterior finished; $460, completed; $660 35 days.

Grand Ave. and Webster St. Two story; owner, E. T. Miller; architect, R. G. Frise; contractors, Toohig & Moore; cost, $7,524; signed, May 9; filed, May 9; payments, $1,881, roofed; $1,881, plumbing done; $1,881, inside finish on; $1,881, 35 days.

Berkeley.

Scenic Tract. One and one half story; owners, Phelps & Richards; contractor, Ira A. Boynton; cost, $2 000; signed, May 19; filed, May 21; payments, $500, framed; $600, brown mortared; $500, completed; $500, 35 days.

Piedmont Park.

Two-story frame; owner, J. B. Richardson; architects, Schulze & Meeker; contractor, W. N. Concannon; cost, $4,792; signed, June 6; filed, June 6; payments, $900, chimney built; $1,300, coat of paint on outside; $1,394, completed; $1,198, 35 days.

BUSINESS MOSAICS.

IMPROVEMENT OF BUSINESS PROPERTY.

Property is valuable, relatively, as it becomes available for business purposes—therefore, any improvement in arrangement or construction that may add to its utility for such purpose is desirable from an architectural point of view; and when we take into consideration the increased revenue from buildings erected with abundance of light, room and air for portions heretofore unused, the advantage to owners of such property is apparent. The cantilever and arch principal as applied to the construction of sidewalks or vault coverings, by Mr. P. H. Jackson of this city, is an improvement of this kind, and should be looked into carefully by everyone who may be interested in the subject. By an inspection of the advertisement on another page, the form of construction is shown. This method of building the arch and sidewalk in combination allows about six inches additional height in the basement under the sidewalk. This is an important feature, especially in the portions of the city where the streets are low and every additional inch for height of basement is a consideration. Where brick arches are used in the usual way, the under side of the arch requires a finish by plastering, cementing or painting, while by the improved method of Mr. Jackson, the finish is included in the construction, and where the imbedded tensile rods are used, the the supporting beam may be moulded in any form desired. The forming of a separate joint between the key arch and cantilever abutments allows a very considerable margin for any unequal strains, caused by variations in the expansion and contraction under special conditions, and which may be liable to occur from unequal settlement. Arches formed in this manner are better adapted for the insertion of elevator and man-hole openings, as the frames for such can be solidly imbedded in the material of the arch.

In addition to the improved arch for sidewalks, etc., the manner of furnishing an increased amount of daylight is worthy of special mention. For a distance of a few feet next the building is placed a platform, either level with the sidewalk or raised one or more steps and formed of iron frame work set with *Hyatt's Patent Reflectors* to direct the daylight into the basement in any direction. At the line of the building the bearing beam for the support of the inner end of the light tiling is set at sufficient height to allow no projection of the beam below the light tiling. By this arrangement the reflected light is not obstructed in its diffusion throughout the upper portion of the space, while in the basement along under the front wall, the supporting pillars and columns of the building are the only obstructions to light, all supports for sidewalk at this line being left out.

At the line joining the illuminating tiling and sidewalk, Mr. Jackson has introduced a method which is a great improvement over the old way of continuing the sidewalk beams to the building line, as it was found that a very considerable portion of the oblique rays of light were obstructed by these beams. By the improved method, the ends of the sidewalk beams are connected with iron beams laid parallel with the line of building, and supported upon iron columns of size and strength to support sidewalk only, and the connecting line between the sidewalk and the illuminating tiling is made over this beam. It can readily be seen that by this form of construction the least possible obstruction is presented for the diffusion of light to the back portions of the basement.

The illuminating tiles are formed with an even upper surface of glass lenses of various forms and set in artificial stone with an iron base plate.

The form of arch construction under consideration need not necessarily be used for sidewalks only, the principle of construction being correct, it follows that floors or coverings of any kind of vault work, where strength, lightness and fire-proof qualities are wanted, this method offers many advantages, and we hope our readers will investigate for themselves by sending to Mr. P. H. Jackson, 228 and 230 First street, this city.

The Stover Manufacturing Co. of Freeport, Ills., notifies the trade that the prices heretofore in force have been revised for Common Sense, Empire and Ideal Sash Pulleys. Send for discount list.

The raising and moving of frame buildings is of such common occurrence as to pass without particular attention, but when we come to brick buildings complications ensue which requires more than ordinary apparatus and of sufficient strength and adaptability for the purpose. The ability of the person having charge of such work should be above the average. In this connection we wish to call particular attention to Mr. Kelleher, 101-103 Juniper street, who has had an extended experience in such heavy work.

When you see any fashionable whim in house building or decorating which you think you want, look in the California Architect and Building News, and see who supplies such articles. The advertising columns are as useful as the reading columns to the wise.

The improvement in closet fixtures, from a sanitary view, has been great. Yet the best is none too good. This fact has been fully realized by the veteran closet manufacturer, Joseph Budde, 43 Fremont street, who presents in this issue improved models for this class of fixtures combining the utmost safety with artistic forms.

Persons looking for ready worked materials of wood should examine the list of materials as published on our advertising page, supplies ready for use by the Excelsior Redwood Co., C. A. Hooper & Co., corner of Fourth and Channel streets, this city. This company also furnishes ready made houses which can be put up in a few hours' time. Many of those houses have been shipped to adjacent countries where they have given entire satisfaction.

Hill's Patent Inside Sliding Window Blinds have become such a necessity that no building with any pretentions to present requirements is complete without them. A perfect sun-shade having stationary or rolling slats, perfect adaptation and adjustment, easily removed for cleaning and as easily replaced. No tearing of curtains and no danger to hinges on account of projecting finish around windows. Try them and you will have no other. Manufactured by Edw. B. Hindes & Co., 411 Mission street.

During a short trip through the country we noticed a larger proportion than formerly of the warehouses and farm buildings in course of erection were being covered on sides and roof with Corrugated iron, thereby reducing the fire risks materially and to the manifest benefit of the owner. Corrugating Co. of Piqua, Ohio, manufacture and furnish this material of almost any size, and with their improved lap joint is superior to that of other makes. This material can be obtained in this city of Dunham, Carrigan & Hayden Co., 17 and 19 Beale street, 18 to 24 Main street, and of W. W. Montague & Co., 309 to 317 Market street.

While reading ancient history the student should give careful attention to the case of Samson and his method of advertising. In his first attempt he took two "solid columns" which brought a house and several thousand people to him.

R. Schmid, the sculptor, 17 Ridley street, has some important work on hand. Mr. Schmid is the sculptor who modeled the "Grizzly Bear" that adorns our editorial table.

Occasionally the architect comes in contact with a contractor who for "ways that are dark and tricks that are vain," resemble the "heathen Chinee." It is related that a well know member of the old school of Toronto architects once proved himself more than a match for a contractor of the class to which we have referred. The contractor was engaged in the erection of a large building under the architect's supervision. The latter, while paying a visit of inspection one morning observed a pile of soft bricks, and having called the contractors attention to them, told him that they must not be allowed to go into the building. The contractor professed surprise that such inferior material should have been delivered to him, and declared that he would have the manufacturer cart them back to the yard again. The architect said no more, but went and stationed himself at the upper window of an empty warehouse near by, from which he could command a view of the operations of the contractor and his employees. He saw the pile of soft bricks gradually disappear and take its place in the construction of an inner wall. The operation occupied a large portion of the day, but he remained patiently at his post until it was finished. Then he went to the contractor and told him in somewhat forcible language what he had seen, and ordered him to set to work and undo what he had done and build the wall of proper material. *The Canadian Architect and Builder.*

Where is the man who does not like to have the latest and most approved articles used in construction of his building. The advertising department of this journal acquaints one not only with the new and hitherto unknown methods, but how to apply old and tried appliances to new conditions.

A new door check has been lately introduced by Messrs. Weatherly & Jardine, No. 135 Market street. See their advertisement in another column. The adjustment of these instruments is so perfect and the door works so easily that the temptation is strong to reopen the door in order to observe more particularly the movement. At least, such is the case with the one on our office door, receiving additional praise at opening and closing.

Cement Bricks have been made in this city for some time; those already used being of such excellent quality a general demand has been the result, to meet, which, the Pacific Tile & Brick Co., have erected extensive works supplied with the latest improved machinery at 108 Utah street, where pressed cement bricks are made in all colors and shades according to formulas used by this company.

E. G. Bossi & Co., 612 Post street, are engaged on some sgraffito and fresco work, which will be more fully described in a future number.

Attention has lately turned in the direction of a more extended use of Plaster of Paris in the finish of interiors. The carrying of tons of water into a building to be dried out through saturation and evaporation seems absurd when compared with Plaster of Paris, where the water enters more fully into the hardening process. Our Pioneer—the Golden Gate Plaster Mills of Lucas & Company, 215 and 217 Main street, will probably give especial attention to the subject, so that before long slowly setting plaster will form a portion of all wall finish.

LYON MANUFACTURING CO.,

SENT IMMEDIATELY TO ANY ADDRESS ON RECEIPT OF PRICE, $15.00

59 FIFTH AVE., NEW YORK CITY.

Sole Agents.

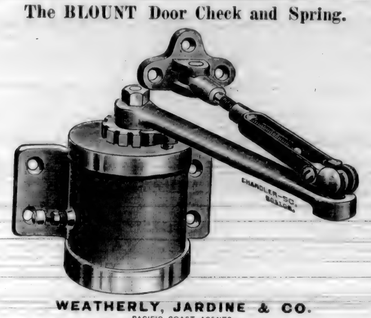
The water closet is one of the most important fixtures in a house, and should receive careful consideration. In this connection we would call attention to the Pacific Water Closet Works of W. T. Rustemeyer & Co., 215 Mission street.

Chapman's Empire Hose Reel is being used generally in new buildings. Having so many good points it becomes a great favorite wherever tried.

Persons having old buildings to be taken down or removed would do well to call on Barnard & Williams, 713 Stockton street. This firm will contract for the taking down of old buildings. They also deal in old or second hand building materials.

The Manly Manufacturing Co., of Dalton, Georgia, has lately increased their facilities for the manufacture of artistic and structural iron work for buildings. This company was, until recently, in business in Philadelphia, but decided to remove to Dalton, Georgia, where the raw materials could be furnished at the least possible cost, consequently, and with apparent reason that they can supply the finished work at correspondingly low cost.

The BLOUNT Door Check and Spring.



A perfect mechanical device with parts so arranged that all friction or wear is reduced to a minimum.

It is free from packing friction, and the frequent repairs required on all door springs using leather packing.

It will work equally well in cold or warm weather, adjusting itself to all changes of temperature.

The regulating thumb screw on side of cylinder quickly adjusts the check to slow or rapid closing of the door.

A novel feature of this door check is the ready adjustment of the spring power by turning the ratchet on upper cylinder cap, for which a wrench is furnished.

The arms are connected by a ball joint, which prevents the check from binding in case the door sags or swings out of line.

It is the best and cheapest check on the market, and everyone is guaranteed.

Agents wanted in all the large towns in Oregon and Washington.

Otto Von Geldern, Sec. Jas. Spiers, Treas.

SAN FRANCISCO CHAPTER, A. I. A.

The regular meeting of the Chapter was held July 11, President S. Babson in the chair and H. T. Bestor, Secretary *pro tem.*

After reading of minutes and the usual routine of business had been finished, the President introduced Mr. Cuthbertson who interested his audience by the reading of a paper entitled *The Scroll, the Star and the City.*

The paper was replete with fresh thought and originality, and was listened to with marked attention. On motion it was ordered printed in the next issue of the California Architect.

The committee to whom was referred the *Sketch Club* competition for gates reported:

S. C. Benson, first mention; H. J. Van Black, second; J. N. Rowell, third; C. A. Meussdorffer, fourth; and Max Rosenberg, fifth mention.

Drawing of the July competition for a hall clock was then opened for inspection and referred to a committee to report at the next regular meeting.

H. G. Lowry was elected as a student member.

A. I. A. SKETCH CLUB.

REGULAR meeting of the A. I. A. Sketch Club held July July 10, 1890. Applications of Mr. C. E. M. Hubbell and Herbert G. Lowry for membership were received and referred to the Investigation Committee.

Four designs were submitted in competition from the members, the subject being a *Hall Clock.* The competition for August to be *A Country Chapel*, seating capacity 150; scale, ⅛ inch to 1 foot. General conditions required. Plan, elevation and perspective, on sheets 15x24, rendered in pen and ink.

The Club is about to form classes for water color painting and modelling.

THE regular monthly meeting of the Technical Society of the Pacific Coast was held Wednesday evening July 9th. A paper on open channels was presented by P. J. Flynn, C. E.

B. McIntire, C. E. who is at present connected with the Vulcan Iron Works of this city, read a paper on Ropeway Construction. The ropeway described and illustrated was for the conveyance of freight for a mine in Mexico. The line was about two miles long with a fall of about fifteen hundred feet to the mile, the load being conveyed to the lower end and worked by gravity.

LEGAL INFORMATION.

With the present issue under the heading of Court Decisions, we commence furnishing our readers with abstracts from decisions rendered by the Supreme Courts of the different States, selecting such as may have special reference to the building interest on this coast.

As there are many parallel cases constantly arising in all parts of the country, the knowledge of such decisions may lighten the burden of care that often weighs heavily upon the busy architect, contractor or investor, and may assist him in shunning complications that may arise in his business relations.

THE promised *grand exposé* of rotten work in the New City Hall walls, in place of developing into the big scandal the daily papers have endeavored to make of it, has collapsed into a comparatively insignificant affair. Experts calculate that the contractors would have profited to the extent of one hundred dollars, had the poor filling not been detected and replaced with solid masonry. As the contract amounts to over eighty thousand dollars, it will be seen that the fraud does not compare in magnitude with what the public had been lead to expect, though the consequences might have been disastrous had it not been discovered.

The matter is now passing from public attention, and will soon be forgotten. We would like, however, to say a word about the injustice of one of the commissioners, who endeavored, at a meeting of the Board, to saddle on the architect the blame for not detecting the inferior work when it was being done.

To begin with, an architect's duties are many and various; he must be capable of conceiving and designing a complicated structure, of combining the various qualities of usefulness, fitness and economy into a perfect whole, he must have the faculty of so expressing his thoughts, that his drawings and specifications are as clearly understood by the workman as by himself, so that the work of each mechanic shall fit into the work of every other mechanic, as one stone fits into a mosaic, and becomes a part of the whole design. He must so handle his materials that no portion of the building be needlessly strong, to entail needless expense; neither should he err on the other side, lest his work lack the necessary stability. He must exercise a general control over the entire work, see that it progresses smoothly and harmoniously and without needless delays, must hold himself in readiness for consultation with his clients, and render decisions on a thousand and one subjects; how many, few but an architect can realize.

Now it is obvious that any man, endeavoring conscientiously to fulfill these numerous duties, cannot give his entire time to one, except by entirely neglecting the rest; for this reason, it is clearly and distinctly provided in the schedule of charges and definition of an architect's duties, adopted by the American Institute of Architects, that in all works of importance where the services and personal attention of a superintendent are required at all times, that such a superintendent or *clerk of works* shall be appointed, subject to the approval of the architect. It is the duty of such a person to be the right hand of an architect, to understand his work, and see that his orders are obeyed.

The case at our City Hall is a point in question; the architect, not being able to devote his whole time exclusively to superintending the details of construction, (which properly belongs to the foreman and the superintendent) trusted, as he had a right to do, to the faithfulness of the superintendent, and the architect was entirely justified in relying on the vigilance of the man whose *sole* duty was to see to the proper performance of the work. If a man devoting his entire time to watching the mechanics, could be imposed on, how could the blame for it be justly thrown upon the architect? We maintain that it would be quite as consistent to accuse the commissioner of direlection of duty, as for him to accuse the architect.

The Commissioner in question is paid by the city to see that it is not swindled; it is through no vigilance of the Commissioner that the city has escaped being swindled.

It is astonishing in what different lights an architect is regarded, before being engaged, and when carrying out his duties; in the former case a client thinks that all he has to do is to make a few drawings and write a little description of them; in the latter case, he must be infallible, must not make a slip, must not omit to mention every nail, must settle disputes between unreasonable beings to satisfy both parties, must be professor, lawyer and judge, and to crown all, a detective skillful enough to discover every defect that a dishonest contractor or workman may use every effort to conceal!

BRICK pavements for streets of cities and towns have many good qualities to recommend them to consideration. In this city some years ago, a system of brick paving was tried which seemed to promise superior results. As then put down, the brick were dipped in hot asphaltum and set on edge over a layer of sand. It seems as if an improved pavement could be made by this system in connection with other late improvements. Such, for instance, as a heavy bed of concrete, overlaid with bricks set in either cement or asphaltum; and in the outlying streets having light travel the upper surface could be coated with asphaltum.

Recent improvements in the manufacture of bricks, whereby various chemical substances are introduced in a manner to form soft, hard, very hard, or colored bricks suitable for any purpose intended renders it a comparatively easy matter for the manufacturer to furnish paving bricks of any degree of hardness or of any form desired. We believe it would be well for interested parties to look into this matter thoroughly, as brick or tile is destined to be the coming pavement in the near future.

THE SCROLL, THE STAR AND THE CITY.

A paper read before the San Francisco Chapter of the American Institute of Architects, Friday evening, July 11th, 1890, by W. J. Cuthbertson

It seems to me that an architect's life is not one adapted to lend aid to the getting up of a good logical and well arranged paper. So many well ordered and methodical arrangements have to be made all the time by him in properly conducting his profession in its multifarious branches and ramifications, that when it comes to doing that which is not absolutely necessary for its proper conduct, he feels, if I may judge from my own case, like I should imagine a lemon feels when squeezed of all its juice—squeezed of all the method and rules in him.

Naturally then one feels like taking a reckless plunge from the hard and fast methods of ones professional life and revelling in artistic literary abandon. This may account for the unsequentiality of this paper and the ramblingness of its remarks and thougnts.

I think myself peculiarly happy in being permitted to address the architects and through them and their organ, the citizens of San Francisco on the subjects of what constitutes a beautiful and well laid out town, which is really the subject matter of this.

Among all the cities in the world, San Francisco presents as great advantages for the display of noble building and arrangement as any other, and therefore on the other hand sustains most injury in the erection of common place and unworthy buildings and bad arrangements of laying out.

We ought to be all proud of the city, and are, counting out a few carpers and cappers, who intrude their jeers at our city in the public prints, comparing it and its building unfavorably with the monstrosities met with east of the Rockies, which I think is not only uncalled for but untrue, for this city can hold its own with any other in America in its architectures. However the duties which ought to justify this pride have been wofully neglected, and instead of building up a city as nature evidently intended, we proceed to attempt to improve upon nature, and "improve" her beauties from the face of the earth. She has given us the makings of a fair and beautiful city and we must remember that we did not raise our mountains nor shape our shores aud islands, and therefore have no right to destroy that which we can never create, and scar up the earth's surface as we have been doing heretofore to fit it to our surveyors' grades and for the ignoble purposes of a selfish commerce and it will be one of our objects to-night to find out a system by which this destructive labor may be done away with.

Any system however leading to this goal will meet with tremendous opposition as it is one of the customs of society, that any thing leading to destruction will receive immediate and energetic support while anything leading to construction or non-destruction will receive but very apathetic notice.

The order for a new destructive agent such as a new ironclad cruiser will be received with congratulations and acclaim and we will employ our government willingly to attend to this, why not rather employ it in making vessels of peace for carrying articles of utility to our people; a much less expensive proceeding, although having far more beneficial results.

Why do we set our Government to do precisely the work from which there is no return, the making of engines of war and the collection of taxes and the making of laws. Let us have our wars and laws made by contract, the same system under which the rest of our business is now being carried on and then let the Government devote itself to some useful and productive occupation, such as providing for the necessary wants of the people, under the same conditions as it as present devotes itself to the destructive part.

And coming down to our municipal government, why not instruct it to save the destructive and useless labor of digging and carrying ground from one place to the other, destroying our grand look-outs and effacing the other beauties, within the confines of our city.

Give them true work to do—to prevent the destruction of our light and the destruction of our air and our watercourses.

Land, Light and Air, the three elemental necessities of our existence, all being destroyed every day in one shape or another and the terrible work being applauded by the people and done by their appointed agents.

Hear what a teacher saith on this point: "To the Persian, the Greek and the Christian, the sense of the power of the God of Light has been one and the same. That power is not merely in teaching or protecting, but in the enforcement of purity of body, and of equity or justice in the heart; and this observe, not *heavenly* purity, nor *final* justice, but here and now actual purity in the midst of the world's foulness, practical justice in the midst of the world's iniquity.

"And the *physical* strength of the organ of sight, the *physical* purity of the flesh, the *actual* love of sweet light and stainless color, are the necessary signs, real, inevitable and visible of the prevailing presence, with any nation, or in any house, of the light that lighteth every man that cometh into the world."

Now, if we don't have an ordinance passed pretty soon limiting the light of buildings where will that light be? Those working in lower stories will become moles rather than men, is that a consummation to be wished. And if we do not leave our natural watersheds as they are giving cleansing and scouring power to the water, and have our sewers put in by day labor under direct control of the government instead of by contract what will become of our purity. And if we do not prevent one landowner using the light area provided by another adjoining owner and compel him to make an area of his own, we have not practical justice, and the light is not in us. Therefore should we agitate for an order compelling the making a certain area of yard room proportionate to the size of the house or premises.

And in the urging of some such practical work I think it is one of the missions of the Chapter of Architects to engage and the duty of the representatives of the citizens to carry out.

We have plenty of ground in this peninsula and there is no other reason for covering up every inch of land and preventing free circulation of air and light except greed. This I hope is considered a vice by all present. You cannot surely call it a virtue or morality to debar even one human being from the proper use of the elements for the purpose of being able to say that one has more pieces of paper supposed to represent coins or even more of the pretty little golden baubles themselves, than your neighbor; yet this is done when we send men into cellars and other unhealthy and overcrowded places to work.

Therefore I say, let us dot this broad peninsula of ours over with no monstrous tall buildings, but trust to the nobler essences of form and color rather than to that of brute size so to form an unique city to which the residents of all other cities where their denizens have to crane their necks backward to see the strip of sky between the gloomy enclosing walls may come to be refreshed and recuperated.

(*To be continued.*)

PERSONALS.

D. H. Burnham of the firm of Burnham & Root, Chicago, has been in town this month on business connected with D. O. Mills' proposed building on Bush street.

W. J. Cuthbertson has withdrawn from the firm of Curlett & Cuthbertson, and has associated himself with Mr. Mooser; the office of the new firm is in the St. Ann's Building, corner of Eddy and Powell streets.

A JUDGMENT FOR MR. SMITHMEYER.

Judge Nott delivered the opinion of the Court of Claims this week in the Smithmeyer case, rendering judgment for the plaintiffs for $48,000. This case was for compensation for services of the plaintiffs, Smithmeyer & Pelz, of this city, as architects of the Congregational Library Building. In 1873 they submitted plans for that structure to the joint commission, which were accepted, and for which they were paid $1,500. For several years they were engaged in the preparation of details and the examination of almost innumerable other plans that were submitted, but received no compensation. Smithmeyer, during this period, made a trip to Europe and studied various libraries and afterwards made a report to the commission. In 1886 he was appointed for the building at an annual salary of $5,000 and Pelz, his partner, was made chief draughtman at $3,000 a year. Smithmeyer held this possession for two years, and Pelz is still in the service. The court went upon the theory that the claimants were entitled to recompense for the service rendered during the period when the commission was examining plans, but the question was on the basis of the recovery. The plaintiffs alleged a right to recover on the total cost of the building as finally planned which, it is estimated, will be about $7,000,000. This would give them $175,000 as their fees as architects, using the ordinary rule of 2½ per cent. Judge Nott indicated by his remarks that he believed that the claimants should recover in a liberal measure, but that upon a vote being taken he had been overruled by a majority of the court. He said that it was his opinion that claimant's fee should be calculated upon the basis of their original estimate of the cost of the building, or $5,580,000, which would give them about $135,000. The court decided, however, that inasmuch as the plaintiffs had finally accepted salaries in lieu of their regular fees at architect's rates their compensation should be in the same measure as the compensation, and, counting the period of six years when they worked without recompense at the rate of $8,000 a year the aggregate of their joint salaries, judgment was rendered for $48,000. The case will be appealed to the Supreme Court.—*Architecture and Building.*

COURT DECISIONS RELATING TO BUILDING CONTRACTS.

ARBITRATION CLAUSE IN BUILDING CONTRACT.

Where a building contract provides that any dispute as to the meaning or scope of the specifications shall be decided by the architect, and that any dispute as to the value of the work omitted by the contractor shall be submitted to arbitration, a claim for work done under the contract, where the only defense is that the work was not properly done, need not be submitted to arbitration. Where the contractor used his best ability and effort to comply with a contract, and the other party retains and receives the benefit of his labor and materials, the fact that the work has not been fully performed and has not been well done, is only a defense to the extent of the damages caused thereby.

Gallagher v. Sharpless, Supreme Court of Pennsylvania, 19 At. Rep. 491.

CANCELLATION OF BUILDING CONTRACT FOR INCOMPETENCY.

Where a contract for the erection of a building provides that the contractor shall erect the building in the best, most substantial and workmanlike manner, and authorizes the owner to terminate it if the work is not done in accordance with the terms, the owner is justified in terminating the contract on account of the incompetency of the contractor and his workmen by reason of ignorance and dissipation. In an action by the contractor for damages sustained by the termination of the contract, recovery was sought for extra work not called for by the specifications, and it is held that if the cost of completing the building was less than the contract price, the contractor is entitled to recover for such extra work, but if the completion of the building was greater than the contract price and the value of the work, he is not.

Rector v. McDermott, Supreme Court of Arkansas, 13 S. W. Rep. 334.

FAILURE TO DELIVER MATERIALS CONTRACTED FOR.

Failure to deliver materials for the completion of a building within a reasonable time, no time being specified for their delivery, entitles the owner of the building to recover damages to the extent of a reasonable rental value of the building during the time occupied by its completion being delayed by such failure to deliver goods..

Scribner v. Jacobs, Supreme Court of New York, 9 N. Y. Supp. 856.

LIEN LAW PRECEDENT.

The Supreme Court of Pennsylvania recently decided in two seperate cases that a sub-contractor engaged in the erection of a building has no lien against the building if the contract between the owner and principal contractor proves that the building should be delivered free of liens. All contracts contain that proviso, but heretofore it was not supposed that it effected sub-contractors and material men, who are not parties to the contract and whose lien is given to them by statute as an extraordinary remedy. This interpretation of the law practically wipes out the Mechanics' lien law, which has been in operation since 1866, and makes all people who do work on or furnish material for a new building look to the principal contractor alone for their money. Under the old ruling a dishonest contractor could under bid all competitors, do part of the work, draw about half the money and then refuse to pay the men. With the fear of a lien hanging over his property the owner was compelled to pay the men, although he had already paid the contractor.—*Architecture and Building.*

BUILDING CONTRACTS.

THE LOWEST BIDDER.

We find in *The American Contractor*, under the heading "Contracts for Public Work," an article as applicable to private contracts as to public, stating facts which, if all who build would heed, would add much to the character, stability and comfort of our homes and business blocks, and peace to the minds and money to the pockets of their often distracted owners, as well as wealth and reputation to the architect who, too often, is responsible for all the trouble. Would do away with Buddenseiks and their flimsy, tumble down fire traps, and leave no employment for the self-styled "architect" and "wood butcher," who prey upon the public under the name of the "lowest bidder."

The man who builds, too often acquires his only building experience as his structure progresses, which experience rolls up upon him for years after his architect and builder are paid. With inexplicable short sightedness, considering his own ignorance of the subject, how often he turns to and trusts, not the man whose work shows his architectural ability, but the sign "Architect." How shamefully often, too, with short sightedness as great, do we find architects of real ability, prostituting their profession in their desire for business, betraying the trust of their patrons, robbing the building of all strength and comfort; letting the contracts to "the lowest bidder," some journeyman tramp with no money, no credit, no honor and no knowledge of his business, whose only thought is how he may "skin" the job with possible profit to himself. This is of yearly occurrence all over our country as all who come in contact with the subject know, and know as well, that we have architects who value their reputation; and builders, lumber dealers and mill workers, who will furnish only honest work and material whether or not they are "the lowest bidders."

The American Contractor says: "Practically all the work on public improvements or the contract to furnish supplies for same is let to the parties or firms offering to do the work or furnish the required supplies for the least amount of money. In other words it is the almost universal rule or custom to let 'to the lowest responsible bidder' all work and contracts to supply material, whether for national, state, county or municipal use. And on first view this seems to be the fairest possible means and calculated to give the greatest satisfaction to all. And this was no doubt the fact when first adopted. Without entering into the merits and demerits of this plan or calling attention to its frequent abuses, as we may find occasion at a future time to do, we wish herein to draw attention to the frequent losses resulting from a too rigid adherence to the rule of letting to the 'lowest responsible bidder.' If the parties letting the contract always had the prescience and judgment to correctly interpret that phrase, 'the lowest bidder,' well and good, but as a matter of fact it is only a question of figures. A's bid is $31,500, B's $29,900, C's $27,320. Of course the contract goes to C if he is responsible and presumably able to do what he agrees to do. And yet it is quite possible that B's bid or A's is in reality the lowest bid.

"Not long since a prominent government official accepted the proposal of a bidder whose bid was a round ten thousand dollars higher than the 'lowest bidder,' and several leading technical journals, commenting on the fact, hailed the 'new departure' as a change in the right direction, for considering the comparative quality of the materials and the repute of the bidders the higher bid was clearly the most advantageous to the government. And we have yet to learn of the success of the lawsuit threatened by the 'lowest bidder.'

In this age of multifarious shams and adulterations, and of multiplicity of things of similar name, grade and apparent quality, one cannot expect to obtain always the material desired by securing bids in open competition based on general specifications and given to the 'lowest bidder.'

"As an instance, we noticed in the specifications for a large building not long since, 'blue Bedford stone of uniform color, cut, etc.'

"In bidding on this, what a fine chance the 'lowest bidder' has! He can put in a surface stone, or qualities that will pass inspection, but in reality be much inferior to what is desired, and so make up on the low bid. But sooner or later the price must be paid by the latter. The repairs necessitated on account of the inferior quality will more than make up what was saved on the lower bid; and, in addition, the building is less durable and gives no satisfaction to the owners.

"When a firm has built up a reputation for honest work and care in carrying out their contracts according to the spirit of the requirements, that reputation ought to stand for something, and it would be extremely rare if the bid of such a firm, as the world now is, should be the lowest one. The nation, the state, the municipality are prosperous and, like the prosperous individual, are entitled to receive the best and receive it at the lowest price. But when, in construction of public works, the contracts are given to the parties who offer to do the work for the least amount of money, they do neither receive the best nor receive it for the least money, as is a matter of notorious comment. And while a change in the manner of awarding contracts or deciding which is the 'lowest bid' may not eliminate the evils or prove a panacea, it is quite evident that the present system can be revised with benefit to the public."

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all Architects on this Coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

The Engine House designed by architects Shea & Shea, is proposed to be erected to house the new water tower.

The lot chosen for the purpose is the vacant space belonging to the city at the junction of Market and Bush streets.

A good deal of opposition to the project has been made by some of our citizens, who think the space should be devoted solely to monumental purposes.

The New City Hall, Omaha, which we publish this month, was designed by architects Fowler & Beindorff. We are under obligations which we desire to acknowledge to the Omaha Engraving Company for the cut.

The first and second mention designs in the competition of the A. I. A. Sketch Club, drawn by S. C. Benson and H. J. Van Vlack respectively, are given in this issue—the third mention was awarded to Jos. W. Rowell. The subject was a country stable costing $5.000.

BOOKS & PERIODICALS.

ARCHITECTURAL EXHIBIT.

CINCINNATI, 1889.

Selections from National Exhibition of architectural drawings and sketches, held at Cincinnati November, 1889, under auspices of Cincinnati Architectural Club.

This collection partakes somewhat of a national character, and compared with all previous exhibitions, is suggestive of the rapid strides the student of architecture is making in originality of design and in the use of his pen. It contains fifty sketches, all reproduced from photographs on very fine paper, and will make a valuable addition to any library; the price being but $1.00.

A NEW WORK ON THE STEEL SQUARE.

The Second Part of "*The Steel Square and its Uses*," just issued by the Industrial Publication Co., by *Fred T. Hodgson*.

The Second Part is not in any sense a substitute for the First Part, which still remains what it always has been—a necessity to every intelligent workman. But it is an extension and enlargement of the First, giving new problems, new methods and new wrinkles for shortening work and increasing the accuracy of the workman. It is illustrated in the same handsome manner which characterized the First Part, to which it forms a companion volume.

With these two volumes in his possession, the workman has at command the entire mathematics of construction, and is prepared to lay out any piece of work more easily, quickly and accurately than it can be done by any other method.

Price, handsomely bound in extra cloth, $1.00. Sent to any address post paid. For sale by the California Architectural Publishing Co.

The July number of *Stone* is full of good things for those interested in stone construction. Among the contents are the following interesting subjects treated: "The Natural Development of Architecture," "Notes on Quarrying," "Stone and Marble in Colorado," "Symbols of Art," "The Great Ice Invasion" and "Trade Schools." In the August number we are promised illustrations of the designs offered in prize competition by the publishers of *Stone*.

The June numbers of *Architecture and Building* are full of well-timed and excellent articles, and a spicy criticism on Prof. Atchison's paper, entitled "Roman Architecture," by Max Schropp, architect. Also excellent illustrations in the way of pen sketches and architectural details.

The Manufacturer and Builder for June concludes a valuable article on "Testing Building Stones," written by George P. Merrill.

House Painting and Decorating is full of good articles as usual.

The Engineering and Building Record for June 28, has an illustrated article on "The Proposed Plan of Sewerage and Paving in Duluth," that is well worth reading by those interested in the subjects.

The Inland Architect publishes a paper read by John W. Root, before the architectural class of the Art Institute, Chicago, and entitled "A great Architectural Problem." Mr. Root treats exhaustively of the requirements, construction and design of modern office buildings, and describes in a clear and entertaining manner the subject of their foundations and their requirements in the clay soil of Chicago.

Carpentry and Building for June comes out with on increased number of pages of text and advertisements, and is full of valuable articles.

The Architectural Era prints as usual, newsy letters from various cities, besides several fine illustrations.

The American Architect.—The June numbers of this popular journal are crowded with the best of reading matter. The paper entitled "Byzantine Architecture in the East" is continued. As this is a transalation from a French work of high standing, it will be of great value to the English reading student of architecture. Taken together with the illustrations, which are considerable in number and remarkable for their variety, they form quite a volume for one month's production.

Among our foreign exchanges for this year is *Decoration-Motive* from Leipzig containing plans of panels and ceilings and full size illustrations for wall and ceiling decoration, edited by Richard Hess, decorator, Leipzig.

NOTES & COMMENTS.

Files may be cleaned and sharpened by electricity. The files being immersed in water which is decomposed by a current of electricity, the oxygen acting upon the cuttings of the file, while the hydrogen bubbles protect the edges of the teeth.

On examination of the eyes of a number of persons, it was found that seven out of eleven had stronger light in one eye than the other—two out of five had one eye out of line—four out of nine were color blind in some degree, and only one out of twelve had good sight in all respects.

This may account for some of the barbarous forms set up and called architectural beauties.—Ed.

Large quantities of lumber are being sent East, from Tacoma.

The Tacoma mill recently cut a clear timber piece 134 feet long, 24 inches wide and 18 inches thick, and contained nearly 5000 feet of lumber, board measure.

A perambulating apiary (a house for bees) is one of the late inovations in California. The hives for the bees are placed on a platform mounted on wheels, and moved from the lower regions, to higher elevations as the season advances and the blossoms appear.

Several capitalists are preparing to build near this city a million dollar slaughter, packing and cold storage house combined.

Many perishable articles may be preserved indefinitely by the electrical deposition of metal such as silver, copper, nickel, etc. A fresh egg coated with silver by this process became a work of art, which when broken after a year's time was found as fresh as when first laid. Meat, cheese or fruits may be preserved by this process. The ancient goose that lays the golden eggs could, perhaps, be embalmed in this manner and continue the deposition of golden eggs till further improvement shall render the process unnecessary.

The Chinese, who do everything in the opposite manner from the rest of the world, reflect the honor due to an illustrious name, back to the ancestors of that name, instead of to its posterity; thus showing they have a better sense of the fitness of things than we have, with all our boasted superiority.

The Supreme Court has rendered a decision in the case against the Hibernia Savings and Loan Society, charged with obstructing Olive Avenue, a small street running from Larkin to Polk streets, between Ellis and O'Farrell. The Bank claimed the street was not public property, but belonged to the Bank. The lower court decided that the street in question had been properly dedicated to public use, and this decision was sustained.

Through the exertions of Mrs. Leland Stanford, a marble monument is soon to be erected on the beach at Monterey, close to the shore, and on the same spot where Junipero Serra, the Franciscan friar, first set foot in California, in the year 1770.

Mrs. Stanford conceived the idea some months ago, and at once took steps to have her idea realized. The work is being performed by a San Jose firm, and will cost $5,000.

THE GENESIS OF ARCHITECTURE.

The following is an extract from a lecture by Louis H. Gibson, formerly editor of *Stone*, delivered some time since in Indianapolis:

One can write the history of earlier building operations without the aid of facts. We know what they must have been. In a hilly country, people found it convenient to build caves. This suggested the necessity for a porch, constructed of small tree trunks or supports, and a covering of boughs or twigs above; in a timbered country, huts with forked corner posts, and timbers reaching from corner to corner, and upper covering of slender pieces interwoven with branches and covered with leaves, and a side covering of natural and simple material. It is easy to imagine that at first only a door is required, and that afterwards a little opening was made for the purpose of securing additional light, and in that way the window idea had its early development. The first houses of this kind probably had only one room—the cooking was done outside the door. After this a crude fireplace was substituted on the inside as being the first thought which had to do with the convenience of the housewife. The development of the Ionic capital had its germ in the simplest kind of wooden construction. There was a post and on top of it a head, the ends of which were rounded off, and finally scrolled in little, and there was the thought which developed the Ionic order. That which followed was a mere matter of detail. The development of the Doric order was even more homely. An expanded cap to give more breath-bearing surface to the girders which went across it and column—itself a tree trunk.

The general forms of construction in architecture are simple enough. The vertical supports, which may be a tree, or a post, or a brick wall, or one of the granite or other stone, a horizontal support or lintel, which may be the limb of a tree or a trunk that is heavier, or a piece of stone. The tree may be left with its bark on, or it may be smooth in its form, as at the present time. The granite or the stone may be natural or it may be polished and elaborately decorated.

The *idea* of the vertical or horizontal supports are the same under any circumstances. This kind of construction is the same the world over. Everything else is a detail. We now have every form which has to do with architectural construction excepting the arch, and in the architectural histories we have discoursed on the origin of the arch, the time when it was first used, and when different kinds of arches were regularly recognized and adapted by the builders and architects of the world. In truth the arch had its origin in the upheavals of the earth. The primitive man no doubt saw it when he excavated his cave. He no doubt found it in the openings to natural caves which stood there before him, and he was able to imitate it. He piled up some stones, and, as he covered the opening, he allowed them to approach one another slightly in the center, and he dropped another one in between and he had an arch. It was taught to him by what was immediately before him. In a constructive sense we have before us all that relates to architecture. All was developed long ago; no one knew when, probably as soon as some one was sufficiently educated to want to get in out of the rain or sun.

Here we have all the constructive forms of building. We may consider the general principles leading to the development of architecture in the same way that we have the constructive features. Some barbarian built a shed and under the protection of its roof and its rude walls he enjoyed some of the luxuries of living, and his mind looked a little from the mere desire to get in out of the rain. He hung the skin of an animal on the wall to get it out of the way. This was a very ordinary housekeeping incident. It was a move in the right direction, however; it was the beginning, which led to taking things off the floor. After a time the cooking utensils found a place in some more desirable locality. This was development; it wasn't art. It was simply the beginning of the movement in that direction. He is thinking of higher things than the mere act of keeping warm. His horizon enlarges. He goes out into the forest in search of food and kills a large and powerful animal. He hangs its skin on the wall of the house, partially for the purpose of assisting in its preservation, and otherwise that his neighbor may see what he has done, in order that his neighbor may see what a great hunter is the householder. Here is the development of his pride. The placing of the skin on the wall in this way is the expression of an idea. It beautifies the house; it is *almost* art. His mind is growing; he trims the loose bark off the beams; he sees something in the grain of the wood that looks like an animal—possibly its head; he accentuates the lines and thus decorates his house; he is a sculptor, an architect; and thus his mind moves on, in time he develops a second Michael Angelo. It takes a few thousand years, but time doesn't count; it is the result. He is the father of the architect of a Greek temple.—*Stone.*

ELECTRICITY USED FOR GENERATING STEAM.

Machinery for generating steam by electricity has been set up here and zealously guarded, but a reporter managed to get into the room in which the plant is located and guarded, and this is what he found:

To a battery of two 20-horse tubuler boilers, a 10-horse engine and boiler is temporarily connected to heat the water in them; steam is raised in a small boiler, and a dynamo used to produce electricity.

The flues in the large boiler are filled with asbestos, the ends are connected with the dynamo, and the passage of the electricity through the asbestos heats it to an intense degree, causing a rapid raising of steam. When the required pressure in the large boiler has been attached, the engine driving the dynamo is attached to the large boiler, and the work goes on as before.

In this way it is claimed that but 25 per cent. of the power of the large boilers will be required to permit 40-horse power, leaving three-fourths of the power to be applied to other purposes. It is claimed that the power can be applied in this manner to any required amount. The 40-horse power could be used after starting to start up a 160-horse power and keep it moving without any cost whatever outside of keeping up the machinery.

This is the first instance on record where power could be increased; nature has always worked the other way and demanded that a stronger should work the weaker, as the 40-horse power to drive 10, and if this proves a success, as is claimed, the company have the biggest discovery ever made in America that will rank next to steam power itself.—*New Orleans Times Democrat.*

ELECTRICITY DIRECT FROM HEAT.

A dispatch from Hartford, Conn., June 2, makes the following remarkable statement: "The conversion of heat directly into electricity without the intervention of steam boilers, engines, or dynamos, is said to have been accomplished by a young Maine inventor, H. B. Cox. His experiments have proved so successful as to lead Boston and Hartford capitalists to organize a company with a capital of $1,000,000 to put the discovery into practical operation. If the claim of Mr. Cox prove true the value of his discovery is enormous, but as yet the experiments have been only on a small scale. His method of changing heat to electricity is as simple as the changing of water to steam, the current coming right direct from the glowing coals of a furnace without the aid of any machine. No power has ever been discovered that is half so cheap as would be electricity obtained by this process. He has experimented with a furness at his home, using a number of electric lights, and it now remains to be seen whether his experiments will hold on a large scale. His discovery would multiply by three at least the effective value of every ton of fuel used for generating power. —*Sanitary News.*

THE PRODUCTION OF CHEAP DESIGNS.

The efforts on the part of building committees to cut down fees of architects results in the erection of unstudied designs. The architect gives as little as he can for the little that he is offered, and thus gets even with his employers. The architect who takes a pride in doing his work as thoroughly as he can, and who devotes much time to the study of it in all its details, cannot compete with the man who is content to impose upon the community his first conception in an exceedingly crude form.—*The Canadian Architect.*

STRANGE USES OF PAPER.

PAPER is now made to serve for steel and iron. When strong fiber is used, it can be made into a substance so hard that it can scarcely be scratched. Railroad car wheels are made of it more durable than iron. A store in Atlanta, Georgia, has been built entirely of paper. The rafters, weather-boards, roof, and flooring are all made of thick, compressed paper boards, impervious to water. On account of the surface of the paper being smooth and hard, it cannot catch on fire as easily as a wooden building. It is found warm in cold, and cold in hot weather. The Breslau fire-proof chimney has demonstrated that cooking and heating stoves, bathtubs and pots, when annealed by a process that renders it fire-proof, became more lasting than iron that will not burn out. Cracks in floors around the skirting board, or other parts of a room, may be neatly filled by thoroughly soaking the newspaper in paste made as thick as putty and forced into the cracks with a paste knife. It will soon harden and can be painted. Black walnut picture frames are made of paper and so colored that no one can tell them from the original wood.

A paper piano has lately been exhibited in Paris. The entire case is made of compressed paper, to which is given a hard surface and a cream white, brilliant polish. The legs and sides are ornamented with arabesques and floral designs. The exterior, and as much of the interior as can be seen when the instrument is open, are covered with wreaths and medallions painted in minature. An Italian monk has succeeded in constructing an organ where pipes are made of paper pulp. It has 1400 pipes of various sizes.

The American Cotton Seed Oil Trust are now running a mill for making paper from the hulls remaining after all the oil has been squeezed out of the cotton seed. They are contemplating an erection of a 100-ton mill for the same purpose. These hulls have heretofore been considered worthless. It has so far proved so successful that the trust propose erecting mills at different points in the cotton raising country. Of course, this will somewhat revolutionize the paper trade.

A new mill for the manufacture of paper from moss has been recently established in Sweden. Paper of different thickness and pasteboard made of it have already been shown, the latter even in sheets three-quarters of an inch thick. It is as hard as wood, and can be easily painted and polished. It has all the good qualities, but none of the defects, of wood. The pasteboard can be used for door and window frames, architectural ornaments and all kinds of furniture. The ceiling of the Assembly Chamber, at Albany, N. Y., is made of papier mache. It is a model of its kind, and appears so like marble as to deceive the most expert eye. The latest idea is to use paper instead of wood for lead pencils, by using a patent preparation by which it can be cut as easily as the softest wood.—*The World's Progress.*

WHO ARE THE PUPILS IN THE TRAINING SCHOOLS.

THE statement is made that the sons of professional men are in the majority in the Philadelphia Public Manual Training School. It is surprising to learn that while the children of artisans are striving to get into the ranks of the struggling and poorly-paid professions, the children of professional men are taking to mechanical pursuits. Prof. William L. Sayre, the principal of the school at Seventeenth and Wood Streets, states; "It is a curious fact that of the boys now in training-school and learning the use of chisels and hammers and laths, fully three-fourths are the sons of professional and business men. We have many sons of doctors and ministers and lawyers." Of the seventy-seven occupations recorded of parents of boys now in the middle class, fifty-four are those of professional or business men and twenty-three those of men engaged in other pursuits, of whom only fourteen are artisans.—*National Builder.*

The Central Pacific R. R. Co. are pushing the repairs on the snowsheds which were damaged by the severe storms of last season.

THE ARAB HOUSE.

The term "Arab," in its application to the domestic architecture of Egypt, as well as the vast region which extends from the borders of Tripoli to the Atlantic Ocean, is misleading. It is a question whether the distinctive features, so familiar to us in every town and village from the banks of the Nile westward, do not represent a reflux of the arts of the Moors rather than the outgrowth of any civilization that can be traced as of Arab descent. The Arabs, as a distinct race, have been at all times nomadic, living in tents, a people without emulation, and possessing none of the qualifications for advancement in the ways of civilization. The Moors, on the contrary, or, more properly speaking, the inhabitants of Mauritania, were not only a people of culture, living in towns, and encouraging art, science, and literature, but they attained a high degree of splendor, and a place in history almost as marked as that of the Romans. The fusion of the conquering Arabs with the inhabitants of Mauritania in the twelfth century, and the spread of a mixed population as far eastward as the banks of the Nile, have given rise to a prevailing idea that we are indebted to the Arab rather than to the Moor for some of the most charming features in ornamental art that have ever appeared in any country. In the planning of ordinary dwelling-houses neither race displayed much skill or originality, but were content to follow the methods of the Romans in all that appertained to their domestic arrangements. So strong is the influence of tradition in this one particular that if a native architect of the present day were asked to design, unfettered, a dwelling of ordinary pretensions, the result would have been equally satisfactory to a citizen of the Empire in the time of Augustus.—*The R. I. B. A. Journal.*

SCHOOL OF ARCHITECTURE AT THE UNIVERSITY OF PENNSYLVANIA.

The University of Pennsylvania proposes establishing an Architectural department. Three meetings have already been held to discuss the matter, and although the exact scope of the school has not yet been decided on, it has been determined to make it as broad as possible. The advice and assistance of several leading architects have been asked and promised to Provost Pepper.

The new study will form one of the features of the Towne Scientific School, and an effort will be made to have practical lectures delivered by the leading architects, and their criticism of the work of the students will also be asked. In some respects the method of work will be similar to that pursued at the law school, the students being registered as draughtsmen in the office of architects and going out to the university for the lectures. A museum will be established, containing casts of details and other helps to practical work, and an effort will be made to gather together a complete library. Degrees will be conferred.

Heretofore architecture has been studied in a subordinate way at the university as part of the course of civil engineering, but it has never as yet been made a special feature of the university work. The oldest and one of the best known architectural schools in this country is that of the Institute of Technology in Boston. The course there is four years. Afterward a department was estabilsed at Columbia College, New York, and also at the schools of Mines, in New York, and a great deal of thought is given to the subject in both institutes. A chair is also supported at Yale, Cornell and some other well-known colleges.—*Architecture and Building.*

OBITUARY.

On Saturday, June 21st, John Cochran died at his residence 419 Hyde street. Mr. Cochran arrived here in '49, and has been prominently connected with the building interests of this coast. He was in his seventy-third year.

CITY BUILDING NEWS.

Bryant near Fourth. Three-story frame; owner, A. Patieclli; architect, M. J. Welch; contractors, S. Cuneo and G. Casaretto; cost, $1,500; signed, June 24; filed, June 25; payments, $1,136.75, framed; $1,136.85, brown coated; $1,136.85, completed; $1,136.85. 35 days.

Battery cor. Bush. Alterations; owner, L. and M. Sachs; contractor, R. McCann; cost, $1,771; signed, May 31; filed, June 9; payments, $1,328.25, when accepted: $142.75, 35 days.

Block bounded by Noe, Castro, Twenty-eighth and Twenty-ninth; cementing; owner, J. Carroll; architect, J. J. Mahoney; contractor, W. C. Watson; cost, $1,650; signed, June 14; filed, June 17; payments, 75 per cent. as work progresses; 25 per cent. 35 days.

Baker near Pine. Two-story frame; owner, C. Hirsch; architects, John & Balczynski; contractors, Wells & Joslin; cost, $3,945; signed, June 11; filed, June 19; payments, $800, framed; $700, partitions set; $700, white coated; $745, completed; $1,000, 35 days.

Castro near Alvarado. Two-story frame; owner, M. G. Wheeler; contractor, F. E. Wharff; cost, $3800; signed, June 19; filed, July 5; payments, frame is completed dark coat of plaster is on; 35 days; in four equal payments.

Clement near Third Avenue. Frame; owner, J. R. Bielly; contractor, C. H. Norton; cost, $2,257; time, 60 days; signed, June 9; filed, June 9; payments, 75 per cent. as work progresses; 25 per cent. 35 days.

Devisadero near Bush. Brick and carpenter work; owner, W. A. Abrams; architects, Salfield & Kohlberg; contractor, A. C. Soule; surety, W. J. Adams and C. S. Holmes, $4,000; cost, $8,857; time, 90 days; filed, June 16; payments, $1,000, framed; $1,000, enclosed; $1,000, doors hung; $2,857, accepted.

Ellis near Taylor. Alterations; owner, L. Schussler; architects, Salfield & Kohlberg; contractor, A. Bischer; cost, $2,050; time, 60 days; signed, June 13; filed, June 20; payments, $750, framed; $450, white coated; $400, accepted; $550, 35 days.

Fulton near Broderick. One-story cottage; owner, N. J. Adams and wife; architect L. J. Welch; contractors, Patterson & Ackerson; cost, $2,800; signed, June 12; filed, June 21; payments, $1,000, ready for plastering; $1,100, completed; $700, 35 days.

Golden Gate Ave. near Willard. Frame cottage; owner, H. M. Wooley; architect, M. G. Bugbee; contractor, A. C. Soule; cost, $2,000; signed, June 21; filed, June 23; payments, $300, framed; $500, brown coated; $400, accepted; $800, 35 days.

216 and 218 Grove. Alterations; owner, J. Levy; architect, J. H. Littlefield; contractor, H. A. Johnson; cost, $1,275; time, 65 days; signed, May 11; filed, June 14; payments, 75 per cent. of work done; balance, 35 days.

Hayes near Devisadero. Carpenter work; owner, Miss A. Wynne; architects, Hueme and Everett; contractor, F. J. Fernhof; surety, H. Hyde, $5,000; cost, $5,780; signed, June 24; filed, June 26; payments, $1,445, enclosed; $1,445, brown mortared; $1,445, completed; $1,445, 35 days.

Jones near Geary. Additions; owner, T. J. Moynihan; architect, T. J. Welch; contractor, A. Jackson; cost, $2,800; signed, May 9; filed, June 11; payments, $800, roofed; $700, second coat of plaster on; $1,270; completed; $800, 35 days.

Jackson near Gough. Dwelling house; owner, A. St. J. Bowie; architect, S. Newsom; contractor, Geo. R. Lang; surety, F. P. Latson, $4,000; cost, $10,625; signed, May 29; filed, July 3rd; payments, on first and fifteenth day of each month at the rate of 75 per cent. of value of work done; balance, 35 days.

Larkin near Pacific. Owner, Geo. W. Duffield; contractor, James Bruce; sureties, Blythe and Trott and B. Joest; cost, $4,850; time, 120 days; signed, May 10; filed, May 10; payments, $1,200, framed; $1,200, enclosed; $1,200, completed; $1,200, 35 days.

Larkin St. Owners, Jno R. Fairchild and wife; sureties, Blythe and Trott and B. Joest; cost, $4,910; time, 120 days; signed, May 3; filed, May 10; payments, $1,200, framed; $1,200, brown mortared; $1,200, completed; $1,310, 35 days.

Larkin, Hayes and Market. Brick work; owner, B. and J. S. Doe; architect, J. H. Littlefield; contractors, Shain & Hoffman; cost, $51,970; signed, June 13; filed, June 21; payments, 75 per cent. as work progresses; 25 per cent., 35 days.

McAllister near Baker. Two-story and basement; owner, P. Claudius; architect, R. Zimmermann; contractor, S. T. Crawford; cost, $2,755; time, September 24; signed, June 24; filed, June 24; payments, $600, framed; $800, plastered; $741.25, accepted; $713.75, 35 days.

Market near Montgomery. Brick work, etc; owner, Crocker Estate Co; contractor, P. Mitchell; cost, $104,800; signed, April 12; filed, June 21; payments, 75 per cent. on first and fifteenth day of each month as work progresses; 25 per cent., 35 days.

Market near Montgomery. Owner, Crocker Estate Co; architect, A. Page Brown; contractors, P. Degan & O. P. Brady; cost, $ 18,900; signed, April 12; filed, June 24; payments, 75 per cent. on first and fifteenth day of each month as work progresses.

Minnesota near Sierra. One-story and rough basement; Owner, M. Haskins; contractor, R. O. Davis; cost, $1,400; time, 65 days; signed, July 1; filed, July 2; payments, $650; stubbing are up; $850, brown mortared; $850, white coated; $550, completed.

Minnesota between Solano and Butte. Not specified; owner, J. O'Donnel; cost, $2550; filed, June 7; payments, $900, rustic on; $500, brown mortared; $800, white coated; $550, finished.

Market near Montgomery. Iron and steel work; owner, Crocker Estate Co; architect, A. Page Brown; contractors, Rix & Firth; cost, $163,900; signed, April 28; filed, June 28; payments, installments of 75 per cent. on the first of each month as work progresses; 25 per cent., 35 days.

923, 925 and 927½ Market street. Repairing; owner, J. P. Hale; contractor, J. M. Day; cost, $1,520; signed, June 21; filed, June 25; payments, 75 per cent. as work progresses; 25 per cent. 35 days.

Meany near Noe. One-story frame; owner, C. M. Page; architect, J. C. Newsom; contractors, Blanchard & Lane; cost, $17,000; signed, June 11; filed June 13; payments, first and fifteenth day of each month.

Minna near Fifth. Three-story frame; owner, R. Carson; architect, J. M. Welch; contractor, M. Walsh; cost, $6200; signed, June, 11; filed June 15; payments, $1822-50, framed; $1322.50, brown mortared; $1322-50, completed; $1322.50, 35 days.

Noe near Henry. Two-story frame; owner, J. O'Brien; architect, H. Geilfuss; contractor, R. Thaler; cost, $7,900; signed, May 11; filed, June 12; payments, $1,180, framed; $1,180, enclosed; $1,180, brown coated; $1,180, white coated; $1,180, completed; $2,000, 35 days.

Noe between Fourteenth and Fifteenth. Owner, L. Zeh; architect, W. H. Armitage; contractor, O. E. White; surety, C. F. Doe and J. T. Adcock, $5,000; cost, $9,700; signed, June 10; filed, June 19; payments, $2,000, framed; $2,000, brown coated; $1,275, white coated; $2,000, completed; $2,425, 35 days.

N. E. corner Fourteenth and Noe. Plastering and cementing; owner, Stelling Bros.; architect, R. Zimmerman; contractor, W. C. Watson; cost, $1,535; signed, June 18; filed, June 20; payments, $600, brown coated, $600, white coated; $335, accepted.

N. E. corner Fourteenth and Noe. Three-story frame; owner, Stelling Bros; architect, R. Zimmerman; contractor, Adam Miller; cost, $10,.50; time, Sept. 30, 1890; signed, June 18; filed, June 19; payments, $1,500, framed; $1,500, enclosed; $1,500, partitions set; $1,500, inside finish on; $1,762.50, accepted; $2,587.50, 35 days.

N. E. corner Fourteenth and Noe. Plumbing, etc.; owner, Stelling Bros.; architect, R. Zimmerman; contractor, Oekelheimer Bros.; cost, $1,922; signed, June 18; filed, June 20; payments, $500, rough work is done and first certificate accepted; $500, second certificate is delivered; $322, 35 days.

N. E. corner Green and Webster. A dwelling; owner, M. C. Bateman; architects, Smith & Freeman; contractor, G. Clements; cost, $7,550; signed, June 30; filed, July 1; payments, $1,416.25, framed; $1,416.25, ready for plastering; $1,416.25, sand finish on; $1,000, ready for painters; $416.25, completed; $1,885, 35 days.

N. E. corner Nebraska and Yuba. Two-story frame; owner, M. Windt; architects, R. H. and R. White; contractor, D. H. Matheson; surety, O. J. Preston, $6,000; cost, $8,657; time, 150 days; signed, June 27; filed, July 1; payments, 1,200, roofed; $1,300, brown coated; $1,500, standing finish on; $1,457.50, completed, $2,010, 35 days.

N. E. corner Post and Buchanan. Three-story frame; owner, L. Busenberg; architect, C. I. Harris; contractor, D. Hennessy; cost, $11,573; signed, June 16; filed, June 17; payments, $2,200, framed; $2,100, brown mortared; 12,173, hard finished; $2,200, completed; $3,000, 35 days.

N. E. corner Post and Buchanan. Plumbing and gas fitting; owner, L. Busenberg; architect, Chas. I. Hayens; contractors, Ford Bros.; cost, $1,155; signed, June 18; filed, June 21; payments, $425, all pipes in; $430, completed; $300, 35 days.

N. W. corner Eddy and Warren. Carpenter work, etc.; owner, C. E. Boynton; architect, W. H. Armitage; contractor, J. J. Mausenu; surety, A. J. Gerdan, $5,000; cost, $1,800; signed, June 23; filed, July 1; payments, $1,200, framed; $1,200, brown coated; $1,200, accepted; $1,200, 35 days.

N. W. corner Laguna and Golden Gate Ave., also Clinton, near Brannan. Painting and graining; owner, M. Frederick; architect, P. R. Schmidt; contractors, E. Price & son; cost, $1,775; signed, June 17; filed, June 19; payments, $425, second story ready for graining; $100, completed; $350, third story is primed; $350, ready for grainer; $400, completed; $450, 35 days.

N. W. corner Nebraska and Yuba. Two-story building; owner, M. White; architects, R. H. and R. White; contractor, D T Pierce; cost, $1,400; signed, June 27; filed, July 1; payments, $800, brick foundation laid; $220, completed; $350, 35 days.

N. W. corner Yolo and Nebraska. Three-story frame; owner, J. Kenny; architect, M. J. Welch; contractor, S. Sarivel; cost, $6,541; signed, June 24; filed, June 25; payments, $1,226.55, framed; $1,226.40, brown mortared; $1,226.40, white coated; $1,226.40, completed; $1,835.25, 35 days.

Oak near Fillmore. Two-story frame; owner, J. Urba; architect, M. J. Welch; contractors, Wells and Joslin; cost, $5,350; signed 15; filed, June 16; payments; $1,337.-50, framed; $1,337.50, brown mortared; $1,337.50, completed; $1,337.50, 35 days.

Powell near Ellis. Alterations; owner, Geo. Parker; architect, M. G. Bugbee; contractor, A. Nelson; cost, $1,150; signed, May 10; filed, June 11; payments, $430, brown coated; $400, finished; $200, 35 days.

Powell, between Eddy and Ellis. Bracing up building; owner, E. J. Stoddart; architect, P. R. Schmidt; contractor, R. Ringrose; cost, $1,18.; signed, May 12; filed, June 13; payments, first and fifteenth day of each month.

Richard near South Ave. One-story cottage; owners, G. H. Merchant and wife; architect, T. W. McKee; contractor, H. J. Bennett; cost, $1,400; signed, May 10; filed, June 16; payments, $200, framed; $200, brown mortared; $250, white coated; $350, 35 days.

Russ near Natoma. Plumbing; owner, W. Zeiner; architect, A. C. Lutgens; contractor, John Bohn; sureties, W. Fahrenkrug and J. W. Firsch, $1,000; cost, $1,350; signed, June 4; filed, June 9th; payments, $500, pipes tested; $512.50, completed; $337.50, 35 days.

Ridley near Sanchez. Two-story building; owner, J. A. Letz, contractor, G. Houston; cost, $3,600; time, 100 days; signed, June 12; filed, June 21; payments, $900, rustic on; $900, brown coated; $900, white coated; 906, 35 days.

Ridley near Guerrero. Three-story frame; owner, L. Boyston; architect, A. J. Barnett; contractor, O. Brault; cost, $5,355; time, 80 days; signed, June 18; filed, June 19; payments, $1,000, rustic on; $700, brown coated; $1,314, completed; $1,340, 35 days.

Seventeenth near Dolores. Two-story frame; owner, Edward O'Neil and Wife; architect, Chas. J. Devlin; contractors, T. J. Cook & W. V. Wry; surities, A. D. Moore and C. S. Holmes, $2500; cost, $3200; time, 90 days; signed, April 14; filed, May 10; payments, $900, framed; $400, enclosed; $600, first coat of plaster; $800, ready for paint; $300, completed; $600, 35 days.

Sutter near Scott. Three-story frame; owner, G. Galvin; architect, J. E. Krafo; contractor, E. McElroy; surities, B. Joost and W. Thyarks. $8000; cost, $7300; time, 90 days; signed, May 11; filed, June 14; payments, $1475, enclosed; $2000, brown mortared; $2000, accepted; $1825, 35 days.

Sutter near Broderick. Three-story frame; owner, W. J. Blackman; architect, C. Toff; contractor, W. A. Van Dervourt; surities, I. Levi and O. H. Greenwald, $8000; cost, $6,375; time 120 days; signed, June 13; filed, June, 17; payments, $900, first story joists are in place; $500, enclosed; $955, brown mortared; $1410; white coated; $1410, accepted; $1600, 35 days.

Steiner near Ellis. Three-story frame; owner, S. P. Blumenberg; architect, Fred E. Wilcox; contractor, O. Jensen; cost, $1,962; signed, June 12; filed, June 19; payments, 75 per cent. of the amount due as work progresses; 25 per cent., 35 days.

S. E. corner Fillmore and Wildey Ave. Three-story frame; owner, E. Schmidt; architect, W. H. Wharff; contractor, B. R. Bankins; surities, A. J. Turner, and B. S. McFarland, $10,000; cost, $11,656; time, 120 days; signed, May 12; filed, June 13; payments, $1000, first floor joists on; $1000, framed; $1500, enclosed, brown coated; $1500 plastered; $750, completed; $3,000, 35 days.

S. E. corner Bay and Fillmore. Two-story frame; owner, Cal. Adamant Wall Plaster Co; architect, Mr. Cottrell; contractor, Thos. Day; cost, $5,250; signed, May 10; filed, June 10; payments, 65 per cent. of value of work performed; 25 per cent., 35 days.

S. E. cor. Fillmore and Willey Ave. Grading and brick work; owner, B. R. Rankins; architect, W. H. Wharff; contractors, J. Barry and P. Turner; cost, $1400; signed, filed June 18; June 19; payments, $500, foundation laid; $500, chimneys completed; $400, 36 days.

S. E. corner Beale and Market. Hydraulic Elevaror; owners, Holbrook, Merrill & Stetson; cost, $6,14 ; filed, June 30; payments, 25 per cent. of whole contract shall be paid when completed; 25 per cent., 36 days.

S. E. corner Battery and California. Iron beams and etc; owner, Tallant & Co; architect, Pissis & Moore; contractor, Geo. Goodman; cost, $1890; signed, June 25; filed, June 28; payments, $1490, entire completion of work; $1490, 35 days.

S. E. corner Green and Scott. Frame; owner, H. S. Bridge; architect, Mooser & Cuihbertson; contractor, B. J. Malone; cost, $5900; time, 90 days; signed, June 14; filed, June 17; payments, 75 per cent as work progresses; 25 per cent., 35 days.

S. E. corner Washington and Van Ness. Frame; owner, Jas. Phelan; architect, C. Day; contractors, G. Ingerson & C. Gore; surities, C. Gore and C. Hansen, $8917; cost, $26,750; time, Jan. 15, 1891; signed, June 18; filed, June, 18; payments, $4000, framed; $5500, brown coated; $4500, ready for painting; $6,062, accepted; $6,688, 35 days.

S. W. corner California and Hyde. Carpenter work; owner, California Street R. R. Company; architect, H. C. Macy; contractor, O. E. White: cost, $15,865; filed, June 20; payments, 75 per cent. of work done, on first and fifteenth day of each month.

S. W. corner California and Hyde. Brick and iron work; owner, California Street R. R. Company; architect, H. C. Macy; contractors, McDowan & Butler; cost, $74,200; filed, June 20; payments, 75 per cent. of work done, on first and fifteenth day of each month; balance, 36 days.

S. W. corner Oak and Pierce. Plumbing, etc.; owner, J. H. Schlesselmann; architects, Salfield & Kohlberg; contractor, J. D. Welch; cost, $1,360; signed, June 23; filed, June 26; payments, $520, rough work in; $300, accepted; $340, 35 days.

S. W. corner Howard and Tenth. A new front; owner, Rev. P. Scanlan; architect, T. J. Welch; contractor, A. McDonald; cost, $2,715; signed, June 23; filed, June 24; payments, 75 per cent. as work progresses; 25 per cent. 35 days.

BUSINESS MOSAICS.

Sanitary science has made wonderful advancement during the last few years, and manufacturers have been quick to endeavor to provide the necessary apparatus. In no other one article has there been such concentrated study to secure the best possible fixture for the purpose as is represented in the modern water-closet. Mr. Joseph Budde, of the northwest corner Mission and First streets, is the leading manufacturer of water-closets on this Coast. For over a quarter of a century the Budde Closet has been the standard closet, and whenever any suggestion for a change for the better either in a sanitary or artistic sense is made, it is at once met by a corresponding improvement by Mr. Budde, until at the present time he has a large array of diplomas and medals from expositions and societies, together with piles of testimonials, all certifying to the superiority of his closets. At certain periods a grand flonrish will be made and a closet with a famous name to back it will be introduced, but after a few weeks' trial is taken out and the standard "Budde" takes its place. The business having attained such proportions that new quarters were required, the manufactory has been removed from 43 Fremont street, the old place to the new pemises, on the northwest corner of Mission and First streets.

Art glass has become one of the necessities of the present day. By no other means can we render such beautiful effects as are produced by the admission of light through a colored medium like glass—the most gorgeous hues of the rainbow of fairy land through the soft twilight to the somb:r tones of night, are all attainable through crystals of various tints and forms, which blend and tone the colors into harmonious pictures, from the ideal high art of the church down through the agricultural, mechanical and civic representations, more or less artistic, as represented by the artist employed. The above remarks have been induced by a recent visit to the art rooms of Thos. C. Butterworth, 15 Polk St., where some ecclesiastical and other art glass was on exhibition, Mr. Butterworth having recently returned from the East and Europe, where he has procured the latest and newest material obtainable for producing the highest class of work in this line.

Fretwork floors of hard wood of various colors are gaining in popularity where good work is desired. The advantages of a smooth hardwood floor is at once apparent, it being easily cleaned, is pleasing to the eye, and its artistic beauty made to harmonize with the room—it is warm and pleasant to tread upon, and is lasting and economical. Messrs Reynolds and Adams at 1237 Market street is the leading firm for this class of work, on account of the good qualities of the workmanship, and artistic ability displayed. They have recently put down 4000 feet of inlaid floors for H. Liebes & Co., Post street.

Cement bricks which are becoming so common in use at this time and taking the place of burned bricks were first patented and manufactured by Mr. Ernest L. Ransom, of this city. After numberless experiments, Mr. Ransom succeeded in making a superior brick of Portland cement and sand, which by the use of coloring material could be turned out bricks of any desired color, size or shape, of even shades or mottled appearance as desired, and of smooth or rough surface. These bricks formed an important addition to the variety of materials for the use of the architect which at once found their position in many novel and interesting features in the artistic attractions for important buildings. Mr. Ransom also invented and manufactured a compound gilder of iron rods and cement stone which is applicable in many situations where natural stone would be impractical. The Cement Brick Company are now manufacturing pressed and moulded bricks of superior quality and of all descriptions under the Ransom patent. New and enlarged works are about completed at the corner of Eighteenth and Folsom streets in this city, which, when completed will be by far the most complete on the Coast, or, in fact, in the country. In the near future they will be prepared for a very heavy increase in the demand for the pressed bricks of this company. The company will soon publish the capacity of the new works.

New articles of hardware are coming into use wherever a want is implied. Messrs. A. B. Cheney & Co., (a new firm) No. 308 Market street, have shown us some improved appliances, especially a spring sash balance with adjustable brake, a door bell which takes up the slack of the wire, also transom regulators, made rights and lefts, all of which present advantages not to be overlooked by those who require the best.

Men of business capacity and character are at a premium.

Tin roofs, "there's nothing like tin for roofs" so says the wise man, and as wisdom comes from experience, we can indorse this statement without any reservation whatever for roofs of moderate pitch. For some twenty-five years or more the N. & G. Taylor Co's brands of tin have been in use on this coast, and have grown in favor with all who have used them. Before that time it was very difficult to detect inferior tin, more especially after being laid, but when the Messrs. Taylor & Co., of Philadelphia, introduced their tin, where each sheet was stamped, it became comparatively easy to detect any deviation from the specification. The tin bearing the trade mark stamp of this company proved uniformly to be of the quality as represented. Persons interested in this matter can send to Messrs. N. & G. Taylor & Co., Philadelphia, for a book called proof positive (free on application) and containing much useful information on the subject. In looking over this book, a person will at once notice the solid business look to the buildings covered with their tin, which argues well for them, as the architects and builders of such class structures would in all probability be competent to select the best in the market. An invitation is extended to everyone interested to send for their new book "How to Secure a Good Tin Roof."

Making use of everything that can be made useful for the intended purpose is economy.

The Vulcan Iron Works at 135 to 145 Fremont street, do all kinds of architectural and ornamental iron work, cable roads and tramways, and ropeways for the conveyance of freight, etc. Mr. McIntire, the engineer who explained the construction and working of a ropeway in Mexico before the Technical Society (see notice of meeting on first page) is at present connected with these works. This company manufacture an improved clip for the attachment of the freight basket to the cable, which reduces the wear on the cable to a minimum. Also many other improvements which those interested should call and examine.

Who, in the early part of the present century, would have thought that at this day the lightning of the heavens would be subdued by man and set in the walls of our houses to furnish a quiet and brilliant light to replace the old-fashioned "tallow dip" of those times, yet such is the case.

Those in want of electric apparatus having superior claims for economical working, should call on W. W. Briggs & Co., electricians, 432 Montgomery street. Also electric bells and enunciators, and all kinds of electric work is furnished and put up complete in the best manner by Messrs. Briggs & Co.

It is an uncontroverted fact that many persons would enjoy their homes more if they would exercise more care in the selection of accessories which make houses more convenient for use and more attractive to the eye. In order to attain this end, scrutinize the advertisements in this number of the California Architect, and if not sufficiently described, write for further information.

Thou shalt not covet thy neighbors goods, without paying for them.

The Detroit Heating and Lighting Company, of Detroit, Mich., manufacture the "Combination" Gas Machine, intended for the lighting of factory or other buildings, in city or country where an independent lighting plant is desirable. This machine presents certain advantages that warrant special consideration by any parties interested. This company also manufacture the Balton Hot Water Heating apparatus which gives an even flow of pure warm air to any portion of the building. Descriptive circulars will be sent on application to the manufacturers.

Architects and Builders' edition, catalogue No. 9, for 1890–91 of the Willer Manufacturing Co., Fourth and Cedar streets, Milwaukee, Wis., has been received. It is a superior sample book and replete with designs as furnished by this company. The frontispiece is a pretty villa in imitation of a water color drawing, followed by a large number of illustrations of inside sliding blinds with details, for which this company is famous throughout the country, and showing the latest improvements; also a representation of sliding screens, and screen doors. This is followed by the stair work and hard work finish department, containing many designs for balusters, newels, rails and stair finish generally. It is a work that has been quite expensive and is a credit to the Willar Company. This catalogue will be sent *free of charge to architects only;* to others a charge of 50 cents in postage stamps, on account of the expensive character of the work. Catalogue No. 10, just issued, will be sent free on request.

NOTICE TO CONTRACTORS.

Proposals will be received at the office of Louis Hyams, city recorder of the city of Salt Lake, Utah territory, up to 12 o'clock M. Monday, the 11th day of August, 1890. Said proposals are for the furnishing of all material and labor for thee rection of a joint city and county building in Salt Lake city. Said proposals to be for the entire building complete, or for the separate parts thereof—(stone and brickwork, cast iron columns, steel beams, etc., hollow tile, fireproofing, plastering, encaustic floor tiling and mosaic floor tiling, and cement work)—all to be in accordance with plans and specifications on file in the office of the architect, C. E. Apponyi, No. 141 Second East street, Salt Lake city, Utah. All bids to be accompanied by a certified check for 2½ per cent. of amount of bid. Said check tobe made payable to George M. Scott, mayor of Salt Lake city, and if the successful bidder to whom the contract is awarded shall fail to enter into a contract within ten days after said award is made to him, and fail to furnish a good and sufficient bond in the sum of 15 per cent. of his bid, the said check to be forfeited to the city and county of Salt Lake, otherwise to be returned. The city and county committee reserve the right to reject any and all bids.

Louis Hyams.
City Recorder.

Salt Lake City, July 9, 1890. *

A Belgian firm has contracted for $3,000,000 worth of iron work to be used in constructing the new court house at Minneapolis, underbidding the manufacturers in this country.

No. 6048 A Pulley.
Page 12 in 1890 Supplement.
The above cut shows the Norris Pulley as it appears in the frame. This Pulley is made so that the Rope cannot possibly leave the wheel.

NORRIS PATENT SASH PULLEY.

STRONGEST AND HANDSOMEST PULLEY MADE.

Our Pulleys you can readily see are the only Pulleys made that do not depend upon the screws to hold them in the frame, the pin for the wheel is back of the bevel or lower end of the Pulley which causes the weight of both sash and weights to pull back, therefore the more weight the more firmly the Pulley imbeds itself in the frame.

Our Pulleys are made in over 1600 different qualities, they are made with Gun Metal Pins, Phosphor Bronze Pins, Steel Pins, Bronze Metal Face, Bronze Metal Wheel, Bronze Metal Face and Wheel. We also make a special groove for chain, which causes the chain to wear twice as long.

Our Self-Lubricating Pulleys if used a life time will always be Anti-friction.

We make a specialty of finishing our Pulleys to match the new finish of hardware now so extensiuely used, such as old Statuary Bronze, Electro Bronze, and old Copper Bronze.

We make Pulleys Plain or Engraved Face, and of Bronze Metal, or any finish required.

Architects and builders generally concede the Norris Pulley to be the Best Pulley in the world.

There are many millions in use, they have been and are used in the finest buildings in the country.

All our Pulleys are numbered, so please order by number, as the number designates size and quality.

Architects wishing a Catalogue and samples will please write us, and we will send same free of cost.

Norris Pulley can be had of any Hardware House in the country, or address

C. SIDNEY NORRIS & CO.

BALTIMORE, MD.

Samples of our Pulleys can be seen at the office of Weatherly, Jardine & Co., 132 Market Street, San Francisco.

THE OCTOBER ISSUE.

Our regular October issue will be an unusually large one, and we propose to make it a remarkably interesting and valuable number; the price of single copies of the issue will be fifty cents.

NOTICE.

Mr. George H. Wolfe, having no further connection with the business of this journal, correspondents will in future address their communications to the *California Architect and Building News*, 408 California street, San Francisco, Cal.

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute Architects, meets second Friday of each month at 408 California Street.
Seth Babson, Pres. W. P. Moore, Vice-Pres.
Oliver Everett, Sec. John W. Curtis, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at 408 California Street.
John Richards, Pres. Prof. Frank Soulé, Vice-Pres.
Otto Von Geldern, Sec. Jas. Spiers, Treas.

The regular monthly meeting of the San Francisco Chapter of the American Institute of Architects was held Friday evening, August 8th.

President Babson in the chair.

Geo. A. Bordwell was elected to fellow membership.

The awards in the monthly competition of the A. I. A. Sketch Club for hall clock were made as follows: H. J. Van Vlack, first mention; S. C. Benson, second; and Jos. W. Rowell, third.

Mr. George H. Sanders entertained the society, and the A. I. A. Sketch Club, (whose members were present by invitation) by an instructive talk on *How to Study Architecture.*

An invitation was extended to Prof. Keith, the electrician, to read a paper before the Chapter explaining the details of electric motors as applied to running elevators.

Several nominations for officers for the coming term were made, and then, owing to the lateness of the hour, the meeting adjourned for two weeks, to complete unfinished business.

The regular monthly meeting of the American Institute of Architects Sketch Club was held on Friday evening, August 8th.

Mr. C. E. W. Hubbell and Herbert Lowery were elected members of the club. The application of Harvey E. Harris for membership was received and referred to the investigating committee.

A communication was received from the Chapter extending to the club a cordial invitation to attend the lecture to be given by M. G. H. Sanders. Moved and seconded that a vote of thanks was tended the Chapter, carried unanimously.

The usual routine of business being transacted the drawings for the August competition (subject, A Country Chapel) were examined by those present. A Yacht Club House was selected as the competition for October. Required plan and perspective rendered in Sepia with a brush. Competition closes October 9th 1890.

The members then retired to the Chapter rooms to listen to the lecture by Mr. Sanders which was very instructive and which was highly appreciated.

The California Electrical Society held their two last meetings in their new apartments in the Murphy Building. The principal topic under discussion at the first meeting was electrical discharges from clouds. Many useful points were developed in relation to the security afforded buildings by the use of lightning rods. At the second meeting the subject being induction many of the members entered into the discussion. This society is taking in new members at each meeting.

The meeting of the Technical Society of the Pacific Coast was held on August 15th at their rooms, 408 California street. The principal business was the reading of a paper by the President, Mr. John Richards, on "balancing centrifugal pumps." An interesting discussion followed the reading of the paper.

The Amateur Photographic Association gave their eleventh publie entertainment at Pioneer Hall on July 31st. The subject, "Illustrated Chicago" being well represented by the lantern and an explanatory address by the speaker.

THE SCROLL, THE STAR AND THE CITY.

A paper read before the S. F. Chapter of Architects, July 1890. By W. J. Cuthbertson.

(CONCLUDED.)

Man being a gregarious animal it is necessary that quantities of men should associate together, not only in their business but also in their abiding places; this becomes a habit, and conglomerations of human beings are the consequences. Notwithstanding the periodic outcries of humanitarians, this consolidation of humanity and consequently of its habitations has been going on through the centuries, until we come to the final development of it in our modern city. It is useless to try to stem the course of this natural habit and wish of man, and therefore it becomes necessary for us to mitigate the severity of its consequences, and finally to hit upon a plan by means of which what appears now to be a curse may become a blessing.

In the course of the evolution of the city, we come across quite a number of different types:

1. We have first the African Kraal, simply a crystallized nomadic encampment, the huts thrown together indiscriminately without order and without plan—the Anarchic type—therefore nothing to learn from this.

2. The ordinary nucleus of an inland town has been some stopping place along a main road of travel, which gradually accreted itself, running out small feelers or feeders in all directions, these generally following the cow paths of the adjoining country—which especially for hilly parts will generally be found the most practicable.

The animal kingdom is given to us for an example as well as for other uses, and in this case the bovines teach us by the paths picked out and made by them to reach their pastures, the most expeditious and least wasteful way of doing this. On the slopes of hills we always find them following the contours of the hills and not making any direct ascents or descents unless absolutely necessary, and we may get some idea even from a cow. Another member of the animal kingdom, the spider, may also teach up a lesson in laying out towns and means for communication, who weaves her web in such fashion that the radiating lines allow her to dart out after prey in short order.

In the inorganic world the section of a tree has also the rings and the radiating lines, but the types I have taken are geometrical, one also being celestial and the other gravic.

These figures, the star and the scroll, have been taken as the guiding principle in designing or laying out a town, and their adaptability will be examined after we have considered the modern type of a town patterned after the rectangular, peculiarly American system. In this there is a formality and stiffness which can be called anything but beautiful. But even leaving on one side its artistic incapacity, we find it greatly lacking in that principle which the moderns pride themselves so much on—utilitarianism or practicality. Economy, another science modern society so unjustly plumes itself upon understanding and possessing, is sadly lacking in this plan.

As you are aware in traveling from one point to another in a town laid out in the rectangular plan, you are compelled to travel along two sides of a triangle instead of along its hypothenuse. This waste of time and labor is very apparent when one is traveling in the country, where your journey's end may be seen but a short distance to one side of you, but you are compelled to deviate from the direct line to it until you become abreast of it and then have to turn at right angles within an infinitely small part of a second backward; but ranchers who use the road constantly would rather be inconvenienced that way than have their ranches cut in two, but in towns that objection doesn't hold. In fact, the only mitigating circumstance seems to be that the surveyor's art is made more simple and easy, but the surveying is done only once while the locomotion is continuous.

The before mentioned waste of time and energy is even added to should the town be situated on hilly ground as in San Francisco, where one has to go up and down hill over and over again in a reckless manner to reach a point which may be nearly on the same level with the starting point.

I believe the rectangular type of town has been in use since the days of George Washington, sometimes in a pure state and at other times with sundry modifications made to help a little the inconveniences mentioned above, such as a few radiating lines for main outlets, cutting the rectangular system arbitrarily, or such as that adopted in the eastern one-half of San Francisco of one main artery with blocks at right angles to it on one side and blocks at some other angle on the other.

Taking everything into consideration, I believe we shall find the mapping of the old towns which have grown up like Topsy, haphazard and shiftless, on the lines of the old generally direct ways of travel more convenient at least for purposes of communication than the modern rectangular blocked city. But this type of city being as one might say anarchistic, i. e. put together without any guiding principle or law, it cannot be taken as a pattern throughout, but only so far as it should accidentally coincide with some law of arrangement. But a number of good points can be taken from it.

In applying any of these examples we find that non-elastic rule will not work with advantage, as the contours of the ground, proximity of the seaside harbor, etc., require modification, and therefore what we want is some system that can be easily modified to suit these abnormal conditions, and yet at the same time retain its guiding principle intact. These conditions are fulfilled, I think, in the plan based on the star and scroll forms. However, before we go into any detailed description of this ideal town, I will bring to your notice an existing instance of an adaptation of that plan.

In Barcelona here represented, (see Figure 1) each block forms an irregular octagon, otherwise the plan is based upon the rectangular system. Clipping the corners off in this way eased the inconveniences somewhat of that system, but still leaves the aspect matter untouched. However, the large open spaces at the intersection of the streets,

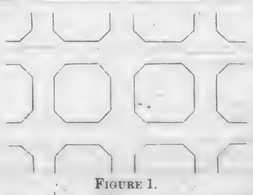

Figure 1.

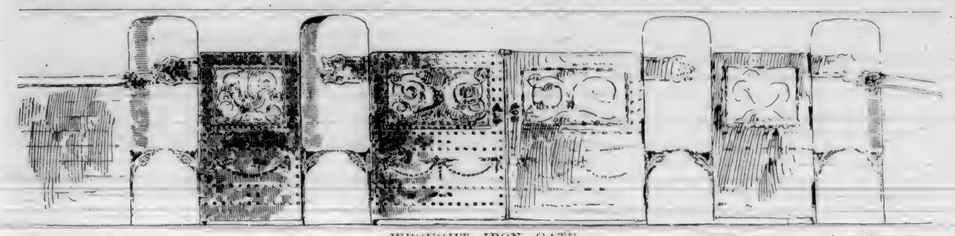

WROUGHT IRON GATE.

Second Mention. H. J. Van Black.

give plenty of light and air and the chance of getting a partial diagonal.

We will now glance at the objection to the rectangular system, and then see whether we can mend matters by the adoption of the scroll and star.

Take it all in all, I think that a no more objectionable form than the rectangular could be adopted for a city where plenty of space is available. Its adoption, no doubt, is due not by reason of its adaptability for laying off a method of connecting a conglomerated mass of habitations, but by the mania existing about the time of the Revolution, or immediately after, for doing everything by hard and fast rules and regulations. To practical men used to the simple surveying adopted in laying out the virgin lands of the new world, what came to hand so well as the same method for laying off a town. And how methodical, proper and correct it looked on paper—blocks all exactly same size, angles all similar, and those all right. No other system was it possible to introduce into the ruling minds of that period, and when once adopted, the natural inertia of humanity has never thought of change until now, when activity and boldness of intellect and life of artistic sense are the worthy characteristics of the generation and age.

The objections, then, are chiefly these:

1. Monotony of aspect.—The houses of every block facing the same points of the compass as those of the others, there remains no chance of getting variety of sunlight or of wind protection. This is aggravated by the absurd devotion to the cardinal points, causing generally the streets to run notth and south, or east and west; thus giving one-half the houses with one front constantly without sun, and the other half getting the sun on the front and back during his weakest moments; *i. e.*, early and late in the day.

2. Monotony of prospect.—A man has no choice of prospect, the houses all facing the same way, and is debarred from living in a house facing a different way from the general run, and therefore has to put up with the prospect the system turns up and no other.

3. Worst possible means of horizon travel short of going absolutely backwards.—This has been already animadverted upon.

4. Bad means of vertical travel.—The roads being arbitiarily laid out without reference to contours, cannot but necessitate the unnecessary going up in one place to go down in another. This does not apply to a town laid out on a prairie like Chicago—where it is necessary to have tall buildings to know that there is any town there.

These unmitigated obstacles to enjoyable life in a city, lead one to ponder on a means of deliverance, and I suggest the scroll and the star as such; the scroll being almost constantly before an architect's eyes when looking down, and the star being in the same condition nearly half the time when looking up. What more natural than that these forms should suggest themselves?

The scroll, when started from its centre, can be carried out into infinite space, a fit emblem for the capacity for infinite progress in the human soul.

The star, with its rays starting from its centre, likewise shooting out infinitely—a fit companion to the scroll—both typical of infinite progress. Such noble types are worthy of study and worthy of adoption for suitable purposes, and I think you will find them applicable for our present purpose "The mapping or arrangement of human habitations in bulk."

1st. They both have a centre, necessary to communal life as the heart to the body. This centre would be the location for the common meeting hall and municipal buildings—including all the Government buildings—head postoffice, telegraph office, telephones and all other buildings necessary for a proper municipal system. Here would also be the common unsectarian church, opera house, theatres, cafes, etc., and the main distributing stores and hotels for strangers all grouped around this large central space, its nearest representations being the large places in Paris.

2nd. From this central circus, place, or plaza, would radiate in straight lines the roads or rays of the star. These would only be used for purposes of communication, being supplied with cable cars. No residences would be allowed on these avenues, but only local distributing stores, local post and parcel offices, etc., and manufactories, at a decent distance from the centre. At the end of these roads would be the car houses, steam power houses, etc.

3rd. The scroll roadway would be the wide driveway planted with shade and fruit trees and clear from all car tracks, commencing from the centre and running in one curved line to the outskirts of one township to that of the next. This would be the residence street, and as it got out into the suburbs the spaces between the road would widen out, and would be used for the larger residences, gardens, etc.; and as it got still further out from the city, for fields and orchards, until the next township commenced. The large diamond-shaped spaces between the circular townships, would be used for pasturage and for large parks for the recreation of the people.

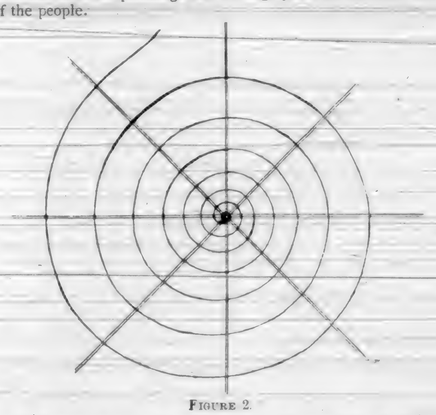

Figure 2.

All the manufactories and warehouses being on the radiating lines, freight would be carried on the cable freight cars, or a special freight cable could be used alongside the passenger one. No residences being on these avenues, the hideous and constant noise attending the running of cable cars would be an undisturbing element, and as the scroll residence road would be paved with bituminus rock or some other quiet-conducive material, peace would reign supreme amongst the domiciles, although the advantages of city life would be so close.

On this road would run a constant succession of Gurney cabs or stages both ways, so that in rainy weather or for old or feeble people, they would carry the inhabitants to the nearest radiating avenue and its cable cars.

Thus every house throughout the whole town and township would be supplied with means of travel from its own doors to any part of the world.

On a plain this system would work to perfection, but on a town of many hills, which concerns us of San Francisco, some modifications would have to be made. In this case the scroll road would not be a true scroll, but would be a continuous

broken curved line following the contour of the hills, giving splendid easy drives, while the radiating avenues would still be continued in straight lines over all obstacles for cable cars. Under this system no scars would be made on earth's breast, but it would be left in its pristine state and the street grader's occupation would be considerably reduced, together with all the squabbles and Commissioners attending the same. By following the contours, big and little, lots would be formed to suit all purchasers.

Each house would have a different aspect and prospect and be got-atable with the least possible expenditure of labor.

The enumeration of the houses could also be carried out to perfection; numbering from the centre outwards, each house would have its own number on the spiral road. The stellar avenues could be numbered in the San Francisco style.

Adaptations of these ideal figures can easily be made when dealing with a town located on the sea coast or harbor, but you will find in all cases that the scroll will answer without any material change.

An approximation to the spiral form is found in the circular or elliptical lines represented in the maps of old European cities, where the enciente of the fortifications gave that form to many of the streets. In this case, however, there is lost the continuous line obtained by the spiral.

Literature not being my profession, any angularities of style as long as they do not interfere with the meaning must be forgiven.

This paper is meant really more to contain hints than anything else, and any objection against this scheme I hope will be freely expressed; for by that means only may these papers be of benefit.

An interesting discussion followed the reading of the paper, which our limited space will not allow of us reporting this time.

LEGAL INFORMATION.

Negligence in Walking Along the Street.—Where one was walking along the street, fell into an area way which was not guarded, nor was there anything to call his attention to it; but could have been seen by looking at it, he was not as a matter of law negligent in not seeing the opening.

Matthews v. City of Cedar Rapids, Supreme Court of Iowa, 45 N. W. Rep. 894.

Goods Satisfactory to Buyer.—When one party agrees to do a thing to the satisfaction of another, and the excellence of the matter is a matter of taste, as a design for a draft, a piece of furniture, or a suit of clothes, the employer may reject it without assigning any reason for his dissatisfaction.

Gray v. Alabama Nat. Bank, City Court of New York, 10 N. Y. Sup. 5.

Building Contract and Subsequent Purchasers.—Plaintiff loaned money upon some buildings in process of erection under a contract that he should be at liberty to foreclose at any time if the completion of the buildings was unreasonably delayed. Such agreement was legal and valid between the parties, and also against all persons who dealt with the property with notice of its existence.

Metropolitan Life Ins. Co. v. Hall, Supreme Court of New York 10 N. Y. Sup. 196.

Joint Building Contract.—When one contracted with an architect to furnish plans for a building, and told him that he and his father-in-law were building it together, and the architect so entered it in his books, the contract is a joint one and the defendant is not liable on a several recovery.

Van Leyen v. Wieford, Supreme Court of Michigan, 45 N. W. Rep. 1116.

Covenant in Deed Controlling the Manner of Erecting Buildings.—Where a parcel of land is subdivided into lots shall be built on a certain line and of a certain height, and the city built on one of the lots contrary to the covenant. It will be liable in damages to a lot-owner whose casement is thus injured.

Ladd v. City of Boston, Supreme Judical Court of Massachusetts, 24 N. E. Rep. 858.

Mooser & Cuthbertson have sent plans down to Guatemala for several two-story dwelling houses to cost about $5000 each. They have also prepared plans for O. T. Davis, Florence, Arizona, for stone, brick and wood ranch house, costing $5000.

NOTICE TO CONTRACTORS.

Sealed proposals will be received at the Office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 10th day of September, 1890, for all the labor and material required for excavation, concrete foundations, stone and brick work of the basement and area walls of the U. S. Post Office, etc., building at Sacramento, Cal., in accordance with the drawings and specification, copies of which may be had at this office or the office of the Superintendent at Sacramento, Cal.

Each bid must be accompanied by a certified check for $500. The Department will reject all bids received after the time fixed for opening the same; also bids which do not comply strictly with all requirements of this invitation.

Proposals must be sealed and endorsed, "Proposal for excavation, concrete foundations, stone and brick work of the basement and area walls of the U. S. Post Office, etc., building at Sacramento, Cal," and address to,

Jas. H. Windrim,
Supervising Architect.

August, 7th, 1890.

The management of this journal desires to extend a cordial invitation to all Architects on this Coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

The double plate shows the accepted design for the new City Hall and Court House, Salt Lake City, from the drawings of the architect, C. E. Apponyi. The fronts are to be of two different kinds of stone, rock-faced, and the construction fire proof throughout.

The artotype of the California State Bank at Sacramento (of which a more extended description appears elsewhere) is to be credited to Curlett & Cuthbertson, architects.

To Editor California Architect:

Sir:—It is too bad that the Supervisors did not heed the protests from all sides against the Bush and Market street engine house; and thus another blunder will be made which will be cursed by our children as much as the present generation curses the short-sightedness of our fathers in covering up with buildings what should have been our City Hall Park, and destroying an approach equal to any in the world.

Now another of our few down-town open spaces is gone from us—and what could have been made a delightful little rest with the $25,000 fountain in the centre which our deceased esthetic minded fellow citizen, Merwyn Donahue, had presented to the city for that spot—and a little grateful shade and green around, is now given up to the tender mercies of a fire engine station and its attendant annoyances. A forbidding looking fortress, striking fear into the quailing heart of the incoming stranger, instead of inviting him onward with pleasant attractions to the more pleasurable part of the city.

DESIGN FOR A CHURCH. *From the Canadian Architect.*

But what can be said to our erring municipal authorities, when we find the State looking on with uninterested eyes upon the wanton waste and destruction of the very few redwood groves, those pleasant oases, left to us.

Look at the energy wasted by our State Representatives in pushing lunatic asylum buildings and spending millions thereon, while a paltry $100,000 to condemn and buy up a few of our remaining redwoods for the benefit and recreation of the people, would be met, even if it were possible to get a member bold enough to propose such a thing, with a howl of indignation and ridicule. But the economy of it is palpable, as any one visiting these State groves a few times a year would have no need of brick and mortar lunatic asylums. These trees can never be renewed, and therefore it is even a greater crime to look on supinely while their destruction proceeds than to help in covering our open spaces with fire engine stations, which we can clear away again when we come to our senses.

The national Government, I hope, will reserve parts of the "Giant Forest" in Tulare county for national parks, and I believe are intending to do something of the sort. Let it preserve our giant sequoias and let California attend to our Coast Range redwoods, and posterity will bless us and admire our regard for it.

* * * * * *

While glancing over one of our weeklies lately, I found illustrations of one of our surburban hostelries which has lately been added to, together with the adjacent club house and other adjuncts, with an architect's name attached whom I knew was not the architect of the building. I found out that he was the architect for certain additions made thereto; and it struck me that this inadvertance, no doubt, has left the impression on one who did not know the facts of the case, that this architect was the architect for the entire building illustrated, and not merely for the additions; which was not right, for a professional man, or any other man, for that matter, should be most punctilious in only claiming what is really his. We cannot have too much of the spirit of honesty and justice in this world.

Yours truly, STROLLER.

LIEN LAW.

The Mechanics Lien Law has heretofore been pretty badly tinkered by courts and Legislature, and it seems reserved for the present court to construe an illogical, unreasonable and unjust law in a most unreasonable manner. A decision handed down last week establishes the rule that if a contractor abandons a building for thirty days, the owner becomes liable for the contractors debts. If that be the correct principal of the Lien Law, it ought to be called "An act to discourage the erection of buildings in this State." That is really its true import to-day. It prescribes how a man shall contract for the erection of a building, not only by directing that such contracts shall be in writing, but, further, that nothing but money shall be taken as payment, and that one-fourth of the sum shall not become payable until thirty-five days after the completion, thus depriving persons of the right to make contracts for lawful purposes as they think best, and it punishes owners who contract to the contrary by making them liable for all the debts and dues of the contractor. The whole thing is a job, and an imposition on property-owners. It was railroaded through the Legislature by the lumber ring of this city. Mechanics' lien laws were originally designed to protect mechanics only. Now their operation has been extended to all and everybody who has anything whatever to do with a building. Why should a lumber merchant, who is as fully as able to look after his rights as any other business man, be preferred by law and given security for the material he sells. Other merchants have no protections or liens, nor do they need lien laws. On the other hand, it is a notorious fact that lien laws have made the merchants entitled to their benefits utterly reckless, and that they are responsible for nearly all of the numerous failures which occur among building contractors. Responsible builders are underbid by worthless ones, who are backed by lumbermen, relying in turn entirely on the lien law for their pay. The contractor is always expected to and does fail, and if the latest Supreme Court decision on this subject holds good, the owner would seem to be shorn of all and every protection. The next Legislature should be applied to to reduce the lien business to some reasonable basis again.—*S. F. News Letter.*

THE CALIFORNIA STATE BANK

AT SACRAMENTO, CAL.

We present our readers with this issue a beautiful arto-type view of the exterior of this imposing structure, together with several interior views, and below will be found the names of the persons who have been the leading instruments in the production of this grand display of art and architecture.

FOUNDATION.

The really most important part of the structure of any building, is that of which but little is to be seen after the building has been completed.

Upon foundations, in a great measure, depend the success of the enterprises for improving and beautifying our towns and cities with well constructed and imposing business blocks, bank buildings, manufactories, etc.

If care is taken and taste displayed in the construction of these improvements, the place obtains a character that makes it attractive for both the citizen and visitor. The California Bank Building, now nearly completed in Sacramento, is a structure of the kind above referred to, and the Chatain—Gilette Stone Company are to be credited with giving it a foundation that will ensure the stability of the structure for ages. Their place of business is 1219 Market street, San Francisco.

STONE.

Mr. David O'Neil of 330 Montgomery street furnish stone used on this building. It is from the Ione Quarry in Amador County. It is a red sand stone and a piece being tested by Mr. Irelan of the State Mining Bureau, stood a pressure of 9295 lbs. to the square inch before it crushed. Among the numerous buildings in which it has been used may be mentioned the following: Crocker Building, cor. Washington and Laguna street, San Francisco; Architect Perry's house, Oakland; Methodist Church, Stockton; Church of the Holy Immaculate, corner of 26th and Fair Oak streets. The new engine house, Bush and Market streets, in the Preston Industrial school buildings at Ione and the Jackson Court House erected thirty years ago.

CARPENTER WORK.

Mr. Fletcher, the well-known contractor, whose office is at 330 Pine street, was selected to do the carpenter work, and his name is a sufficient guarantee that the work has been fulfilled to the letter of the contract. He has an extensive business in this city, as well as throughout the State. Among the many fine buildings that attest his skill and workmanship may be mentioned that of Mrs. Parrott's on California street, between Montgomery and Kearny, also another for the same lady on the corner of Davis and Sacramento streets, valued at $26,000, four large buildings from three to five stories in height, for the Pacific Power Co., and many others, including the residences of James Burling, William Burling, Col. E. E. Eyre of San Mateo, and the present residence of M. H. De Young on California street. He is now engaged on the Academy of Science building on Market street, which is a gift from the late James Lick.

STAIRS.

The stairs were constructed by A. I. Sanborn, of Mission & Fremont streets, in this city.

He is one of the pioneers in his line of business, and his work adorns many of the finest houses here and throughout the coast.

The stairs are of Spanish cedar and are eight feet wide. The flight of stairs leading to each floor break into two parts, thus winding about an eight foot well running to the roof, closed in by elegant wood work in oaken balustrades, with carved oaken posts supported by mounted arches and lattice.

HOSE REELS.

The fire protection consists of four of the Schenck's hose reels, which are considered the finest fire protection for the inside of buildings it is possible to procure. Since their introduction some three years ago, hardly a prominent building has been put up but what is provided with them, and the record shows they have put out a large number of fires, and have never yet failed when called upon.

The large hotel at Coronado Beach has 87 of them in service, and 48 have just been placed in the Palace Hotel of this city. Quick and sure work and reliable aparatus is an absolute necessity for all inside fire protection, and these reels give this in perfection.

INLAID FLOOR AND FRET WORK.

The rooms of the Sutter Club have been fitted up in a style of finished elegance befitting the renown of this celebrated association. The floor of the dining room is of ornamental hard wood with wide inlaid border of oak and walnut finished in the most approved manner.

Fret work like inlaid floors has come to be almost a necessity where an attempt is made for ornamentation, it being at once structural, artistic and light, this fact is made apparent in the billiard room where a beautiful panel of intricate fret work has been placed at one end which adds to the general lightness and agreeableness of the room. The work mentioned has been done by Messrs. Reynolds & Adams of 1237 Market street, San Francisco, who are acknowledged to be at the head for the best of this class of work. From the long list of buildings where Messrs. Reynolds & Adams have put inlaid floors and fret work, we select the following: S. Hirsch, Broadway between Van Ness avenue and Franklin streets, S. L. Everett, S. W. Rosenstock and Wm. Friese, Washington and Van Ness avenue, of San Francisco, Governor Geo. C. Perkins and Geo. D. Metcalf, Oakland and A. N. Fink, Washington Market, Alameda.

VAULT WORK.

As one of the first considerations in a bank building are the safes and vaults, an architect cannot be too careful in giving out a contract of this kind so as to be sure that the parties contracting for such work are responsible people. The Hall's Safe and Lock Co., of 609 and 611 Market street, were selected to do this part of the work. There are two vaults, one 8x12 feet, steel lined, burglar and fire-proof, and closed by massive steel lined doors, secured by Hall time locks.

Beneath this main vault, in the basement, is the bank's storage vault, of similar character and size. There are 500 small steel safes for renters, each safe being fitted with the most approved safe deposit locks, with different combinations for each safe. This firm is the leading one of this kind on the Pacific Coast, and their numerous large contracts which they have on hand at the present time, aggregating $150,000, attest this fact.

ART TILE WORK.

The improved methods of fitting up the interiors of buildings for business and domestic purposes is meeting with general favor among all classes, hence the impetus that has been given to the manufacture of fine and artistic goods for that purpose. With this fact staring us in the face, one cannot deny that the esthetic side of the American character is keeping pace with the development of its general nature. Those who have never visited such establishments, would be surprised, on their first visit to such a one as W. W. Montague & Co's., where displays of goods would meet their eyes outstripping almost the highest ideal for interior fittings in the way of fire-place facings of art tile, illustrating in enduring form and color, almost every phase of domestic and civic life. They would there find tiles of the most beautiful patterns of inlaid mosaics, and brass and bronze frames, mountings, and ornaments of beautiful designs and skillful workmanship.

At the New California State Bank, now in course of completion at Sacramento, may be seen evidences of the ability and skill of the above named firm. All tile flooring, grates and fire places, as well as all of the heating and ventilating contrivances were furnished and put in place by this firm. We therefore recommend to persons who contemplate building and completing to the extent illustrated by the above named beautiful building, to call on W. W. Montague, 309 to 317 Market street, San Francisco.

SHEET METAL WORK.

The slate roofing, copper, tin and galvanized iron work on the new bank now nearly completed in Sacramento, was executed by the Eagle Sheet Metal Works located at 1213 and 1215 Market street, San Francisco.

William Cronan, the proprietor of this establishment is an old resident of this state and is well known in the building trades to be one of the foremost workers in sheet metal on this coast. His extensive contracts successfully executed have given him a standing in the building trades that inspires the fullest confidence in his ability and integrity. We commend him to those needing his services in this line.

INTERIOR BANK FITTINGS.

The counters for the Banking department are constructed of solid mahogany, of an unique design, with Tennessee marble base and bevel plate glass guards or screens set in frames of oxidized copper ornamenting the top of the counter. All this work was furnished and put up by Webber & Co., corner of Post and Stockton street, San Francisco.

GLASS AND GLAZING.

The glass and glazing of a building of this class is of the first importance. The large lights require strength and toughness as well as clearness, which in this instance are highly polished plate for the windows, and heavy glass for the dome, over the stairway. Only a firm of large resources could assume the responsibility for such an amount of high grade glass as has been used for this building. With pleasure we note that the pioneer house of the Sullivan, Kelly Company 915 and 919 Second street, Sacramento, furnished and set the glass. This of itself is a sufficient guarantee to note that this portion of the building is as it should be. This old and tried house has occupied a high position for many years on account of the superior quality of their goods, and the fair and equitable manner of dealing with their customers.

ART GLASS.

All this work has been furnished by the well known Pacific Art Glass Works, No. 1211, 1213 and 1215 Howard street, San Francisco. John Mallon, the proprietor of this establishment is now, we believe, the oldest worker in Art Glass on the Pacific Coast.

PLUMBING.

The plumbing in this building was done by Crouch & Lyman whose place of business is at No. 511 J street. They are an old established firm and their work speaks for itself. The edifice is fitted up with combination gas and electric light fixtures throughout. There are twenty-four marble top washstands fitted up with 16-inch bowls and Peck's No. 8 combination faucets, also three enamel bath tubs with faucets similar to washstands. The latrines are Boyle's patent and are set in stalls of Tennessee marble. The water-closets are of a pattern made especially for this enterprising firm. The sanitary appliances as far as drainage is concerned is complete throughout, extra heavy cast iron pipe being used in conjunction with traps and vents. They have the most complete stock of plumbing goods and gas fixtures in Sacramento.

PAINTING.

Messrs. Krebs & Co., the pioneer firm of 626 J street, Sacramento, was selected to do the painting and decorative work. From an artistic point of view they have carefully carried out their contract, the wood for interior rooms being especially selected had to be preserved as far as possible. Messrs. Krebs & Co. have by a series of experiments discovered methods of treating woods so as to give a gloss and finish equal to a piano polish.

They are the recognized leaders in their line of business, and have done work on many fine buildings, such as the State Capitol, Art Gallery, Hall of Records, County Hospital, Odd Fellow's Temple, Masonic Hall, and the residences of Albert Gallatin, the late Charles Crocker, Mrs. E. B. Crocker, Edgar Mills, General Redding and many others.

Being thorough men of business as well as competent mechanics, attentive to their work, and careful to fulfil all agreements to the entire satisfaction of their many patrons.

CITY BUILDING NEWS.

BUSINESS MOSAICS.

To meet the growing demand created by a stricter interpretation of the Fire Department orders in this city, the Forderer Cornice Works at 224–226 Mission street are constantly receiving new supplies of goods for their works. The name of the proprietor of this establishment stands as a guaranty for the work of the Company, and that the satisfactory manner in which new patrons will find their contracts completed, we are sure will induce them to continue business with them.

We desire to call the attention of the public to the excellent water closets now being manufactured and sold at a very low price by W. J. Rustmeyer & Co., 215 Mission street.

House painting and decoration, both for its preservative nature as well as for decorative considerations, is perhaps the one in which the greatest abuses and frauds are practiced. Therefore care should be taken in selecting the painter, that he have both character and reputation, A combination of such qualifications the public will find in Wm. Armstrong & Son, No. 404 McAllister street.

In letting out your plumbing work invite those who have established reputations for doing good and faithful work. For such call upon Thomas Clark & Sons, No. 611 McAllister street.

The pressure brought upon the public by the increased rates of insurance consequent upon the immense destruction of property by fire, have led the public to adopt less combustible material for the construction of buildings, hence the Iron Lath has been introduced to prevent the spread of fire in interiors. There are several patents for this material now on the market, and one of the best of its kind, probably, is that manufactured and for sale by M. J. Donovan, No. 1171 Market street, San Francisco. There are points of excellence in his which builders and others will do well to examine, which he will take great pleasure in pointing out to those who will make him a call.

Wire Works.—Since the first introduction of wire works and wire wares on this coast, a great improvement has been made, both in style and variety of the goods manufactured, and the ingenuity of the artisan continues to be taxed to produce new articles of usefulness for domestic and building purposes. Persons needing supplies for building purposes, will find a great variety of designs from which to select at C. H. Gruenhagen's San Francisco Wire Works, 669 Mission street.

A few years ago we heard for the first time of the attempt to manufacture gas in small quantities for domestic and commercial purposes. The ideas of safety then required that the crude material from which the gas was to be made must be removed at a distance from the place at which it was to be used. But modern improvements and ingenuity have banished distance for this purpose and gas is now obtained by the use of portable machines located anywhere about the premises. Such machines are now to be had of Jacob Schieber at No. 43 and 45 Stevenson street, San Francisco.

Tanks are now more frequently used for storage of water for domestic purposes than ever. With the abundance of water now known to exist beneath our feet, there is no excuse for the lack of that precious fluid in towns and country places, where there are not public water works. Fulda's Planing Mill makes a specialty of furnishing this article at No. 30 to 40 Spear street, San Francisco.

One of the laws peculiar to the State of Illinois is that pertaining to the line wall, and is the exact opposite of the law in several of the Eastern States.

When an architect commences work on a lot adjoining one on which a building stands, he sends word to the owner of said building that operations are about to be commenced, and warns him to protect his foundations. Should he fail to do so, and because of excavations made for the new building, the whole or a portion of the old one should fall on the lot on which is the building in process of construction, the owner of said lot and building may sue his neighbor for trespassing, and obtain damages as has already been ruled by the Supreme Court. It is a law which amuses and enrages the ordinary property owner, according as he is an active participant in the fray or merely a passive observer.—*American Architect.*

Mann's Patent chimneys as a substitute for brick have long been in the market and are well known among architects, builders and owners, and are acceptable to the insurance companies. With this, patent, marble mantels can be put up in any part of a wooden structure. They have been found to be both earthquake and fire proof. As the inner surface is smooth terra cotta and the joints flush, there is but little chance for lodgment of soot and can therefore be relied upon for a clean current of heated air and smoke, upwards, and down drafts are prevented by the cap surmounting the whole above the roof. This chimney is for sale by Schuster Bros., No. 306 Sutter street, San Francisco.

There seems to be a growing desire for capitalist to invest in tall buildings, as the ground in densely populated cities increases in value. That a greater rate of interest is thereby obtained, is evidently becoming a fact. In connection with this comparatively new mode of utilizing ground values, other important considerations are forced upon the investor's attention; such as safety of construction, and a safe and convenient method of access to the upper stories. To this end the elevator is now engaging the attention of the foremost inventors. Among the many contrivences for this purpose, those embodying the hydraulic principle seem to be the most in favor, and those most used in this city now are manufactured by Wm. H. Birch & Co., who have added as a factor to the safety of their elevator the Ellithorpe Air Brake and Air Cushion. Their place of business is No. 119 Beale street, San Francisco.

Formerly cement pipes were extensively used for sewers and drains, but now the iron stone pipe is manufactured and sold at such low rates that the cement pipe has been driven from the market. The best Vitrified Iron-Stone Pipe can now be found at Tracy Bros. & Co., No. 20 and 22 Eighth street.

Scarcely a day passes that does not bring to light some new invention for utilizing steam as a motor power. To produce steam in the most economical manner is now the study with mechanical engineers. Dundon's San Francisco Boiler Works is now manufacturing a portable boiler that seems to be a favorite among those who need a small amount of power. Call on Mr. Dundon at No. 314–318 Market street and examine his works.

As the season opens the inquiries for the Metallic Lath, manufactured by the Cincinnatti Corrugating Co., of Piqua, Ohio, increase, showing that it is still growing in popularity. It is found in practice that this style of lathing is the most effective as well as the most economical on the market. Especially do contractors and workmen find advantages over all other styles in the matter of putting it on. Its rigidity gives it a great advantage over all other forms of wire cloth. It forms a strong bracing to the building, and can be used over many open spaces where other styles would not be effective. This Lath generally comes in pieces about four inches wide for the narrowest, to about twelve inches wide for the widest. It runs from two to eight feet in length as circumstances require.

By the use of this Lath very smooth and solid walls and ceilings are secured. As there is no shrinkage or expansion there can be no cracks. It can be easily adapted to curved surfaces for such work as groined arches, coves, cornices, etc. It is also the best article for fire-proofing, for covering iron girders, posts and beams. The protection secured by its use is equal to that of tile, while its weight is not over one-eight as much. At the same time it costs only one-fourth as much.

Steam fitters find this Lath specially adapted to their needs, both for covering around registers and about air flues, and for use in partitions. It is extensively employed in covering hot-air pipes and boilers, and is suitable as a base on which to apply plaster-of-paris, adamant, abestos or mortar of any kind. This Lath requires no cross-furring, even with unusually wide spans. It is economical of plaster, and the mortar adheres firmly to the surface. This with the perforations makes a key the strength of which is unequaled. Further, this Lath is the only kind that can be put in place by a workingman alone.

They would be pleased to send samples and full information by mail upon application. Address the Cincinnatti Corrugating Co., Piqua, Ohio.

No. 6040S A Pulley.
Page 12 in 1890 Supplement.
The above cut shows the Norris Pulley as it appears in the frame. This Pulley is made so that the Rope cannot possibly leave the wheel.

NORRIS PATENT SASH PULLEY.

STRONGEST AND HANDSOMEST PULLEY MADE.

Our Pulleys you can readily see are the only Pulleys made that do not depend upon the screws to hold them in the frame, the pin for the wheel is back of the bevel or lower end of the Pulley which causes the weight of both sash and weights to pull back, therefore the more weight the more firmly the Pulley imbeds itself in the frame.

Our Pulleys are made in over 1600 different qualities, they are made with Gun Metal Pins, Phosphor Bronze Pins, Steel Pins, Bronze Metal Face, Bronze Metal Wheel, Bronze Metal Face and Wheel. We also make a special groove for chain, which causes the chain to wear twice as long.

Our Self-Lubricating Pulleys if used a life time will always be Anti-friction.

We make a specialty of finishing our Pulleys to match the new finish of hardware now so extensiuely used, such as old Statuary Bronze, Electro Bronze, and old Copper Bronze.

We make Pulleys Plain or Engraved Face, and of Bronze Metal, or any finish required.

Architects and builders generally concede the Norris Pulley to be the Best Pulley in the world.

There are many millions in use, they have been and are used in the finest buildings in the country.

All our Pulleys are numbered, so please order by number, as the number designates size and quality.

Architects wishing a Catalogue and samples will please write us, and we will send same free of cost.

Norris Pulley can be had of any Hardware House in the country, or address

C. SIDNEY NORRIS & CO.

BALTIMORE, MD.

Samples of our Pulleys can be seen at the office of Weatherly, Jardine & Co., 132 Market Street, San Francisco.

NOTICE.

MR. George H. Wolfe, having no further connection with the business of this journal, correspondents will in future address their communications to the *California Architect and Building News*, 408 California Street, San Francisco, Cal.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE ARCHITECTS, meets second Friday of each month at 408 California Street.
SETH BABSON, Pres. W. P. MOORE, Vice-Pres.
OLIVER EVERETT, Sec. JOHN W. CURTIS, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at 408 California Street.
JOHN RICHARDS, Pres. PROF. FRANK SOULÉ, Vice-Pres.
OTTO VON GELDERN, Sec. JAS. SPIERS, Treas.

THE Annual Meeting of the San Francisco Chapter of American Iustitute of Architects was held Friday evening September 12th. The reports of the retiring officers received and the following officers elected to serve the coming year, namely:—

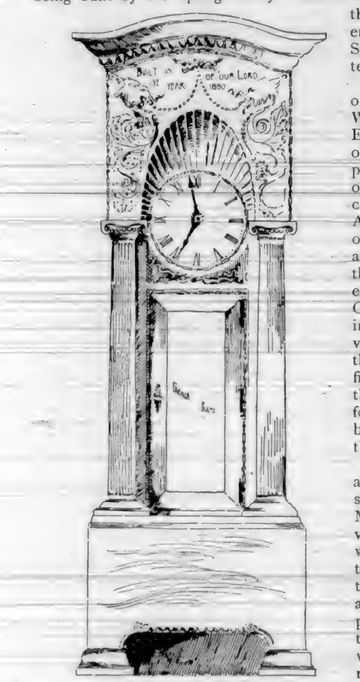
SETH BABSON, Pres. W. J. CUTHBERTSON, Vice Pres.
OLIVER EVERETT, Sec. J. W. CURTISS, Treas.
Trustees, W. P. Moore, G. W. Percy, Geo. H. Landers, Geo. A. Bordwell and E. J. Molera.

THE mentions in the monthly competition of the A. I. A. Sketch Club for August, (the subject, A Hall Clock) were as follows: First mention, S. C. Benson; second; H. J. Van Vlack; third, Hugh H. Hinds; fourth, John Williams.

THE meeting of the Technical Society of the Pacific Coast was held on September 5th, at their rooms 408 California street. The subject being Hydraulic Cements and Concrete by Mr. Calvin Brown, who is well known on this Coast as a very eminent authority, he having designed the extensive dry dock at Mare Island some years ago for the Government, having traveled throughout the Eastern States and Europe to become acquainted with the most approved technical and mechanical requirements for the production of the best possible work in that line, thus, being so thoroughly informed in the details, Mr. Brown's remarks were replete with instructive knowledge and was listened to with attention by those so fortunate as to be present.

AT a recent date the California Camera Club of San Francisco, invited their friends to an exhibition of views of Chicago. These views were prepared and presented by the Chicago Camera Club to represent the early history, and phenominal growth and modern greatness of Chicago. The views shown indicated in a marked degree the taste and judgment of the photographers in order to illustrate the magnitude of the immense structures, where in some instances, the instrument used must have taken in a field of 75 to 80 degrees. The steriopticon (a triplet) worked without a hitch, the slides being brilliantly lighted were clearly represented on the large screen, which was set (which is unusual in lantern exhibitions) so as to give the proper perspective effect. The lecturers voice was heard distinctly in every part of the large hall which was filled even to standing room. Aside from the general pleasure of the exhibition its advantages as an aid to the study of the Architecture of the Country is worthy of note, especially, to those who have not recently visited the more important Eastern cities, such illustrations being full of hints that may be turned to profit by the thoughtful, and in no other way can such realistic scenes be depicted as those by a lantern journey. The Camera Club is in a prosperous condition many of our architectural picturesque camera shooters being members.

WITH the commencement of the next volume of this Journal—1891—we propose to introduce a new heading, the design for which will be subject to competition; particulars in regard to same will appear in the October issue.



S. C. BENSON.—FIRST MENTION.

ALMOST interesting construction, from the point of view of an Architect or an Engineer, is the concrete dam now being built by the Spring Valley Water Company, to replace the present earthen dam at Crystal Springs in San Mateo County.

Upon invitation of President Charles Webb Howard, and Engineer Schussler, of the Water Company, the members of the San Francisco Chapter of the American Institute of Architects, and also the members of the Technical Society of the Pacific Coast, were lately invited to pay a visit of inspection to the works, and some fifty members of these societies were fortunate enough to be able to accept the invitation.

Leaving this city at 8:30, the party soon reached San Mateo, where conveyances were in waiting, and were then driven first to the old earthen dam at Crystal Springs, passing on the way the new structure, which is designed to replace in name and purpose the old dam; the County road will cross the reservoir at this point over a solid fill, which method was chosen on account of its economy, as it will cost but a fraction of what it would have been necessary to expend to bridge the lake, the Supervisors of the County insisting that the road should cross here to avoid a detour of several miles, which would have been necessary if the road followed the banks.

After a short stay at this place, the return was made to the main point of interest, the great concrete dam. An excellent general view of the works was had from the road above, which passes quite close, though a considerable distance had to be traversed before the dam was reached.

Arrived at the point of destination free permission was extended to inspect and question, and free use was made of the opportunity to obtain valuable information, acquired by the experience of carrying out this immense undertaking.

Mr. Schussler kindly explained the many points that would interest the professional men present; the principles underlying the design, the causes that lead to its adoption, the manner of its construction, and the materials and methods employed in the work, were all made clear to an interested audience.

Expressions of praise and admiration at the beauty of the conception, and the substantial manner of its realization, were frequent; and it was enthusiastically declared and unanimously agreed that the solid monolith of concrete now being raised, would be in existence, and serve as a monument to its builders, long after the hills which buttress it on either side, shall have wasted away, and become a part of the level plains below.

After thoroughly inspecting and reinspecting the work, lunch was served, and afterwards toasts, speeches, and a lively interchange of ideas and information were the order of the day, till Mr. Howard gave the word, "All aboard for Belmont, to see the pumping station."

More than one camera recorded some of the many interesting sights of the excursion, and furnished lasting souvenirs of a most enjoyable and instructive occasion, thanks for which are also due to Architect Geo. W. Percy, who, as a Committee on Excursions from the San Francisco Chapter A. I. A. so successfully arranged the affair.

THE boycott against brick manufactured at Verplanck's Point, New York, which we mentioned some time ago, has been carried out by the Union leaders of New York and Brooklyn, and, besides the manufacturers at Verplanck's Point, war has been declared against the Haverstraw brickmakers. The reasons given for the attack are that men are employed who do not belong to the Brick-Moulder's Union, and that wages are paid irregularly. The first, we need not say, ought not to be accepted for a moment as justifying a conspiracy against the manufacturers, but it is probably the only real reason. As the Verplanck's Point and Haverstraw manufacturers make about two-thirds of the brick used in New York, it occurred to them after the boycott had lasted two or three weeks, that they might do a little boycotting on their own accounts, and, after conferring with the other brickmakers who supply the New York market, they came to an agreement that unless the New York Union leaders withdrew, within a week, the order, under which no Union man is allowed to touch a boycotted brick, the combined manufacturers would send no more brick to New York or Brooklyn until the offensive order was cancelled. As it would be impossible, at short notice to bring brick from Philadelphia or Connecticut it would be expensive and inconvenient, this adoption by the brick manufacturers of the same tactics that have been constantly used against them by the Unions for some years past, would result in total abandonment of building operations in the two great cities, and in throwing out of work, for the period which the brick-makers would determine, nearly every member of the affiliated Unions whose leaders play so recklessly with their interests. We trust, for the sake of the mechanics and their families, that the matter will not be allowed to go on so far, but the unexpected turn which the controversy has taken should serve as a warning, that in this country the people who make bricks are just as free and combined for their own protection as those that use them, and that if those who control the immense power of workingmen's associations, chose to use without regard to decency or common-sense, they must not be surprised if any opposing combination should administer to them an occasional dose of their own medicine.—*American Architect.*

ACADEMY, ARCHITECTURE AND ANNUAL ARCHITECTURAL REVIEW. 1890.

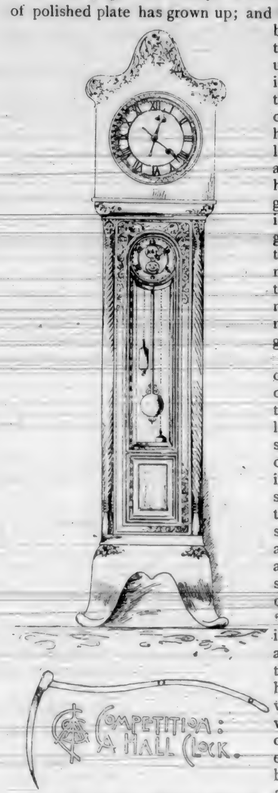
The American Edition of this work for this year is very fine, and should be in the hands of every architect in the country.

The work is edited by Alex. Koch Architect, and contains:—

1st A selection of the most prominent architectural drawings hung at the Royal Academy Exhibition.

2nd A Review of interesting architectural subjects carried out or designed during the last few years.

Mr. William Mueller of 695 Broadway, New York, who is the publisher of the *American Edition*, says, the work presents in a very concise, neat and accomplished form a large amount of matter interesting and valuable to Architects, Draughtsmen, Designers, as well as to students and lovers of art in general. The publisher's price, $1.50 per copy.



H. J. VAN VLACK.—SECOND MENTION.

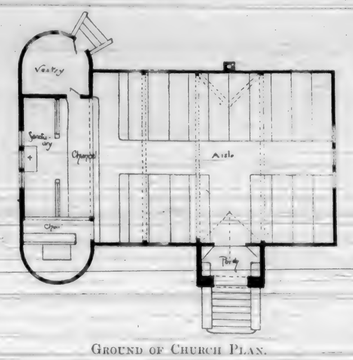
THE future of the glass industry in the United States is encouraging, for it is only since the war that the manufacture of polished plate has grown up; and there are now running, or building, enough furnaces to supply all that will be used in this country. It is within the last ten years that the manufacture of cathedral and rough plate has been thoroughly established, at first disputing and then controlling the home market against England and Belgium. The improvement in window glass has been great, and there are workmen and manufacturers who think they see the rising sun of much better days and a much better American glass.

The concentration of capital in powerful concerns must certainly lead to changes in the system of labor and are bound to insure a more finished product. A new glass recently invented in Germany is said to add marvelously to the power of the microscope. A Yale professor announces the invention of a perfect acromatic telescope lens. Legend tells of a lost invention of "malleable glass." Tiberius is said to have discouraged a genius who found the secret by beheading him, fearing that the innovation would reduce the value of gold. It is also recorded that Cardinal Richelieu was presented with a bust of malleable glass by a chemist, who purposely let it fall into fragments, and mended it before his eyes with a hammer. The inventor was promptly rewarded by perpetual imprisonment, lest his ingenuity would ruin the "vested interests" of French manufactures. But if glass may not ape the metals in malleability it may imitate them in another respect just as important. A more fortunate Frenchman (M. de la Bastie) has within a few years introduced into Europe a transparent glass, which he claims may displace cast iron. If it fulfills his expectations it will mark a new era on glass, and the old adage, "as brittle as glass" will be superceded by a new one, "as tough as glass." By his process railway sleepers, fence posts, drain pipes, tanks, etc., are cast in moulds and so toughened by a bath in oils as to be stronger than iron, though it is much lighter and costing one-third as much. But it is questioned whether his results reach what is claimed for the process. These undeveloped toughening processes augur the most astounding changes in the coming future of glass.

"Glass houses" may become the fashion and we would have to reverse our proverb about them, for they would be bomb-proof. Already transparent glass brick are made.

Extending the possibility of glass a little further, why may we not build the entire structure of glass? The walls might be cemented blocks cast like hewn stone, but it would be translucent and of any color. One could thus inhabit a huge multiform, some of them telescopic bringing distant things near; some with lenses or mirrors guiding the focused sun's heat for culinary purposes; others straining out the light or chemic rays.

Tapestries, furniture and utensils might be made of universal material. The whole would be more enduring than granite. No fire can harm it; lightning will shun it. Such a dream, blossoming from this miraculous substance, may be realized by an Alladin whose lamp is of glass.—*Exchange.*



GROUND OF CHURCH PLAN.

MANY people appear to think that all architects and draughtsmen have to do is to go to their offices at about nine o'clock in the morning and make a few pictures and plans. They seem to regard the work of the architect as little more than a pleasant pastime. This mistake arises from their ignorance of the many and complicated duties and the actual labor, serious thought and study which really belong to the profession of architecture. How little conception to the public has the intense mental strain which the conscientious architect has to endure. When it is considered that the architect has to rack his brains and bring to bear upon each design all his powers of invention in order to produce something new and fresh, and different from all his other efforts; that each design must invariably be drawn over twice, thrice and sometimes half a dozen times before the client's ambitious aspirations and the limit of his pocket book can be reconciled; that when at last this is accomplished and the contract finally signed, scores of working drawings have to be made besides the regular scale of drawings and their duplicates; that all these drawings have to be accurately figured so that every stone, brick and timber will work out right; that the specifications—requiring an amount of writing which would mean a fortune to a lawyer, but which counts little to the architect—have to be carefully written up, it will seem, perhaps, that the office of the architect is no sinecure and that his path is not strewn with roses. Nay! rather it is covered with the thorns and briars of the thousand conflicting fancies, caprices and assumptions of superior knowledge which confront him at every step. But the subject is too deep for us to consider farther at this present writing. We started out to say something on the importance and the necessity of atheletic exercises and games for the architect and his draughtsmen, and if we do not return to our original intention at once it will be like Josh Billings' lecture on milk.

The nature of the work required and the strain upon the nerves and brain demand that the architect shall have some kind of physical exercise every day for an hour or so, which shall in some measure restore his equilibrium; also, he needs a complete change of mental exercise when he leaves his office which shall impart a healthy reaction to his brain and give it a needed rest. Rest does not always mean relaxation, but more often a change of occupation; although a short period of perfect relaxation each day is undoubtedly good for most of us. Ought not a gymnasium to be considered as a necessary part of the equipment of every well regulated office—to be used not only for the benefit of the architect, but for that of his employees? The work is close, confining and wearing to both nerves and brains, and nervous and mental weariness react upon the physical forces, thus affecting the whole being. Let the architect have some hobby—it may be amateur photography, it may be fishing, rowing, riding, literature, art and drama, cycling; in fact, any manly and wholesome amusement which will bring into play an entirely different set of nerves and muscles, and thus rest his tired brain and do him good, and will prove the tonic or sedative which he he needs.—*The Architectural Era.*

San Francisco, Sept. 4th, 1890.

Editor California Architect and Building News—

Dear Sir:—I beg to call the attention of the readers of the Architect to a matter frequently overlooked in providing protection against fire in our new buildings, and which is liable to lead to serious disaster.

In buildings furnished with fire hose, it is frequently found that with 1½ inch hose, (and smaller should not be used) the standpipe is only 1½ inches. At the best a pipe of this size would afford but one good stream, therefore when, in the excitement of a suddenly discovered fire two or more hydrants are opened, it is found that the "protection" is a failure, while the reliance upon the hose has in many cases prevented the keeping in readiness of filled fire pails, the simplest, cheapest, and in inexperienced hands the most effective of fire appliances.

Three inches is quite small enough for a standpipe for effective fire service. In smaller pipes the loss of pressure, principally from friction, is so enormous as to greatly impair the service, and experience shows that to be effective, the capacity of a standpipe must be sufficient to allow for this loss, and also for errors in judgment sure to occur in the hasty use of fire hose in an emergency. Respectfully,

F. H. PORTER,
Chief Inspector.

LEGAL DECISIONS.

Loss of Profits as Damages for Breach of Contract.—When one contracts to do that for another by means of which he is to secure profits which may be ascertained with reasonable certainty, upon breach of the contract without his fault, he may recover such profits, and these may be shown by establishing the cost at which the work could be done, and deducting that from the contract price.

Ennis v. Buckeye Publishing Co., Supreme Court of Minnesota, 46 N. W. Rep. 314.

Recovery of Value of Services Performed.—Where one performs services for another, and for any reason except voluntary abandonment of his contract, fails to comply fully with the terms of the agreement. if the portion of the work which he does is of benefit and value to the one for whom they are done, he may recover their reasonable worth and value less such damage as may have been sustained by reason of the breach of the contract.

Gove v. Island City Mercantile and Milling Co., Supreme Court of Oregon, 24 Pac. Rep. 521.

Extra Work Under Building Contract.—A contractor entered into a contract with a church corporation to erect a church edifice. The contract provided that no extra work should be paid for except upon a certificate of the superintendent and building committee. A sub-contractor did some extra work under the oral direction of a portion of the building committee, for which he seeks to recover. The sub-contractor was chargeable with notice of the provision of the contract and cannot recover in absence of the certificate it called for.

Shaw .v. First Baptist Church of Winona, Supreme Court of Minnesota, 46 N. W. Rep. 146.

Subrogation of Parties.—The defendant corporation entered into a contract with a county to furnish the iron work for a county jail and to become responsible to the other contractor for all delays caused by failure to put the iron work in in time. In an action against it for damages caused by delays, the following rule governs: "When one person, for a valuable consideration, engages with another to do some act for the benefit of a third person, the latter may maintain an action against the former for breach of such engagement."

Grant v. Diebold Safe and Lock Co., Supreme Court of Wisconsin, 45 N. W. Rep. 951.

NOTICE TO CONTRACTORS.

Sealed proposals will be received at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 30th day of September, 1890, for all the labor and materials and putting in place complete the iron columns, iron floor and iron and wood roof construction, terra cotta arches, &c., for the U. S. Custom House, Post Office, &c., building at Port Townsend, Washington, in accordance with the drawings and specifications, copies of which may be had on application at this office or the office of the Superintendent.

Each bid must be accompanied by a certified check for $200.

The Department will reject all bids received after the time herein stated for the opening of the same; also bids which do not comply strictly with all the requirements of this invitation.

Proposals must be enclosed in an envelope sealed and marked, "Proposals for the Iron Columns, Iron Floor and Iron and Wood Roof construction, Terra Cotta Arches, &c., for the U. S. Custom House, Post Office, &c., at Port Townsend, Washington," and addressed to,

Jas. H. Windrim.
Supervising Architect.

September 1st, 1890.

The residence shown in our lithographs this month was designed by architects Chas. R. and John R. Wilson.

The Country Chapel, at Auburn, is from a perspective drawing furnished us by Mooser & Cuthbertson, architects, and the ground plan on another page shows the arrangement of the interior. The cost of the building will be about $5,000.

The perspective view of the Apartment House is by McDougall & Son.

THE city of Mexico is to have the finest hotel on the American continent. It is to be erected by a syndicate of Mexican capitalists, and its cost at the lowest estimate will exceed $2,000,000. Of that sum the Diaz government will provide $1,000,000 in the form of a subsidy, in addition to granting the free importation of material to be used in the construction. The hotel will be five stories in height, and will contain 400 guest chambers built about a court, the dimensions of which will be 100 by 225 feet. It will be constructed of stone quarried seventy miles from the city of Mexico, and its interior will be arranged on a scale of Oriental magnificence. The floors will be of mosaic marble and the walls inlaid with Mexican onyx, which takes a remarkable polish, while the woodwork will be of cedar, mahogany and rosewood. The entire structure will be absolutely fireproof, and the outside dimensions will be 450 by 452 feet. As an example of the magnificence of the designs it may be stated that it is the intention to expend $35,000 in fitting up the Turkish bath apartments, and the bar and fixtures will require an outlay of $80,000. The rotunda of the hotel will be taken in charge by the federal government, and it is the intention to decorate it with precious stones representing historical subjects. —*Mechanical News.*

CONSTITUTION AND BY-LAWS

—OF—

The San Francisco Chapter

—OF THE—

American Institute of Architects.

CONSTITUTION.

ARTICLE I.

The corporate name of this Society shall be The San Francisco Chapter of the American Institute of Architects.

ARTICLE II.

The objects of the Society are: To unite in fellowship the architects of the Pacific Coast, and to combine their efforts so as to promote the artistic, scientific and practical efficiency of the profession.

ARTICLE III.

Section 1. The membership shall consist of Active, Corresponding, Honorary and Student members.

Sec. 2. The condition of active membership shall be the honorable practice of the profession of architecture in accordance with the Constitution and By-Laws of this Chapter.

Sec. 3. The status of an architect is hereby defined as follows: An architect is a professional person, whose occupation consists in originating and supplying artistic and scientific data preliminary to and in connection with the construction of buildings, their appurtenances and decorations; in supervising the operations of contractors therefor; and in preparing contracts between the proprietors and contractors thereof.

Sec. 4. No member shall accept direct or indirect compensation for services rendered in the practice of his profession, other than the fees received from his client.

ARTICLE IV.

Section 1. The officers of this Chapter shall be as follows: a President, a Vice-President, a Secretary and a Treasurer and a Board of five Trustees.

The first four officers shall constitute an Executive Committee.

Sec. 2. No one shall be eligible to the office of President, unless he be a member in good standing of the American Institute of Architects.

ARTICLE V.

Section 1. The Chapter shall hold an annual meeting for the election of officers, and monthly and special meetings as provided in the By-Laws.

ARTICLE VI.

Section 1. The Constitution may be altered or amended only upon a two-thirds vote of all the active members in good standing, ascertained by a letter ballot, after twenty days written notice to each member.

BY-LAWS.

ARTICLE I.

MEMBERSHIP.

Section 1. Active members shall be practicing architects, whose professional status shall be demonstrated to comply with the constitution, residing in the State of California, or the neighboring States and Territories, who shall have practiced their profession at least one year previous to applying for membership.

Sec. 2. Candidates for active membership shall submit to the Chapter through the Secretary, an application for membership as follows:

To the San Francisco Chapter
of the American Institute of Architects:

My full name is .....

My business address is .....

The name of my firm is .....

I have practiced the profession of architecture for .... years.

The accompanying photographs, numbered respectively 1, 2 and 3, show completed buildings, erected from my plans and under my supervision:

No. 1 is a (here give general description of building).
No. 2 is (ditto).
No. 3 is (ditto).

The accompanying drawings are (here enumerate and describe such drawings as the candidate desires to submit).

We, active members of the San Francisco Chapter, A. I. A., hereby indorse Mr. .....'s application for active membership. We know him personally; we know his work; we believe him to be worthy of membership.

.....

.....

All applications of, and any further information concerning candidates shall be considered confidential by the Executive Committee which shall absolutely reject, or provisionally accept each application, and shall cause the Secretary to send to each active member of the Chapter, the name and address of each candidate provisionally accepted, together with those of their indorsers, with a ballot to be filled out and returned to the Secretary. The ballots to be opened and counted at the first regular meeting of the Chapter, held not less than twenty days after the prescribed notice of such application shall have been sent to each active member by the Secretary. If upon counting the letter ballots received, it is found that three or more ballots have been cast against the admission of any candidate, he shall be declared rejected—otherwise he shall be declared duly elected an active member. Any rejected candidate may make a new application after the expiration of one year.

Sec. 3. Members who have relinquished the practice of the profession, and thereby lost their right to active membership, also foreign architects, civil engineers and other scientific men, as well as amateurs of distinction, may be elected Corresponding or Honorary members of the Chapter, by a majority vote of members present at any regular meeting. Corresponding or Honorary members shall have all the privileges of the Chapter, except that of voting and of holding office.

The membership of any Corresponding or Honorary member residing on this continent, shall cease whenever he engages in the active practice of architecture.

Sec. 4. Student members shall include those who have studied architecture in the office of an active member for a period of at least six months previous to applying for membership.

Sec. 5. All resignations shall be made in writing, and addressed to the Secretary. But a resignation shall not release the member presenting it from any obligation to the Chapter, and all interest in the property of the Chapter of members resigning, or otherwise ceasing to be members, shall be vested in the Chapter.

ARTICLE II.

MEETINGS.

Section 1. The Chapter shall hold annual meetings on the second Friday in September of each year, for the purpose of receiving the annual reports of officers, the election of officers for the ensuing year, and the transaction of such other general business as may be presented.

Sec. 2. The regular meetings of the Chapter shall be held the second Friday in each month.

Sec. 3. Five active members shall constitute a quorum at all regular and special meetings.

Sec. 4. Special meetings of the Chapter may be called by the Secretary whenever the President or Vice-President shall be requested in writing by five active members, setting forth the purposes in full of such meeting; but no other business than that specified in the call, shall be considered at such meeting. The Secretary shall notify all members of such special meetings at least three days prior to the time fixed for said meeting.

ARTICLE III.

NOMINATION AND ELECTION OF OFFICERS.

Section 1. The officers of the Chapter shall be elected by written ballot at the annual meeting in the month of September of each year, and at other times when necessary to fill vacancies occurring from any cause.

Sec. 2. The nominations for annual election of officers shall be made at the regular meeting in the month of August of each year, either by open nominations or through a nominating committee. In either case, the names of the nominees must be presented to the Chapter at the regular meeting next prior to the time fixed for the election of officers, or at a special meeting called as provided in Section 4 of Article II. But under no circumstances shall an election be held at the time and meeting when the nominations are submitted.

Sec. 3. The officers elected as provided in this Article shall enter upon the discharge of their official duties on the evening of their election, *after* the annual reports of the retiring officers shall have been submitted to the Chapter.

Sec. 4. All officers elected as provided in this Article shall hold office for the period of one year, or until their successors are elected; except that should any elected officer fail to discharge the duties of his office satisfactorily to the Chapter, his office may at any time be declared vacant by a majority vote of those present at any regular meeting of the Chapter, and the vacancy then and there filled by nomination and election, provided the Secretary shall have notified the delinquent officer, by personal or postal service, of the intended action at least one month prior to such action being had.

ARTICLE IV.

REPORTS OF OFFICERS.

At the annual meeting in each year, the respective officers of the Chapter shall make a full report in writing of all matters intrusted to their care, custody or control, during the terms of their offices respectively.

ARTICLE V.

DUTIES OF OFFICERS.

Section 1. The President, or, in his absence, the Vice-President, shall preside at all meetings of the Chapter. In the absence of both, a presiding officer shall be chosen *viva voce*.

Sec. 2. It shall be the duty of the presiding officer to preside at all meetings of the Chapter, and preserve order therein; see that the Constitution and By-Laws are properly observed and enforced; that all officers and committees perform their respective duties; appoint all committees not otherwise provided for; have the casting vote in all cases of ties; the right to vote for admission of members and for officers of the Chapter; sign all warrants authorized by the Chapter; and perform such other duties and functions as are laid down in Cushing's Manual for presiding officers.

Sec. 3. The Secretary shall keep a record of the proceedings of the Chapter, and of all matters of which a record shall be deemed advisable by the Chapter; he shall notify members of their election, and provide a registry in which the Constitution and By-Laws are inscribed, and procure the signatures of every member thereto; he shall issue all notices of regular and special meetings, conduct all correspondence subject to the directions of the Executive Committee, and have control of the seal and archives of the Chapter; he shall preserve all documents ordered placed on file, and draw all warrants on the Treasurer (which warrants shall be countersigned by the President) for moneys ordered paid by the Chapter or the Executive Committee.

Sec. 4. The records and correspondence of the Chapter (except in reference to qualification of candidates for membership) shall at all reasonable times be open to the inspection of any member of the Chapter in good standing.

Sec. 5. The Treasurer shall collect all moneys due the Chapter, and disburse the funds only upon warrants duly drawn by order of the Chapter, or the Executive Committee, duly signed by the President and Secretary.

Sec. 6. He shall keep the accounts of the Chapter in books belonging to it, which shall be at all times open to the inspection of the officers; and shall report at every annual meeting, and oftener if required, upon the state of the funds.

Sec. 7. The duties of the Executive Committee shall be to exercise control and supervision over the affairs of the Chapter, provide rooms, make all purchases and contracts not otherwise provided for, but shall not incur any liabilities in excess of the amount of unappropriated funds in the hands of the Treasurer, except by special instructions from the Chapter, and shall perform such other service as may be for the best interests of the Chapter.

Sec. 8. The committee shall make a full written report of its acts and doings at the annual meeting, and whenever required by the Chapter, which reports shall be placed on file and spread in full on the minutes of the meetings.

Sec. 9. The Trustees shall organize as a Board as soon after their election as practicable, by the election of a Chairman and Secretary.

Sec. 10. The duties of said Trustees shall be to take charge of, and hold in trust for the Chapter, all funds over an amount in the hands of the Treasurer necessary to meet the current expenses of the Chapter; all property and valuables which may come into the possession of the Chapter by gift, purchase, transfer or otherwise; deposit all moneys in their possession, belonging to the Chapter, in such bank or savings' institution, as they may deem proper. They shall also make a full written report of their official acts, and the state and condition of the funds, investments and properties of the Chapter at each annual meeting, and whenever required by the Chapter, which reports shall be placed on file and spread in full on the minutes of the meeting. And at the expiration of their term of office, they are to deliver up all moneys, properties and valuables of every nature and kind, together with all books, papers and other things belonging to the Chapter.

Sec. 11. Each Trustee shall give a separate bond for the faithful performance of his duty, in such amount as the Chapter may from time to time require.

ARTICLE VI.

FEES AND DUES—RESIGNATIONS.

Section 1. The admission fee for active membership in this Chapter shall be six dollars, and for student membership, two dollars, which amount shall accompany the application.

Sec. 2. The annual dues for active members shall be six dollars, and for student members two dollars, payable in advance on the first day of September. Members elected during the latter half of the fiscal year shall pay one half the fee for that year.

Sec. 3. No member who shall be over one year in arrears shall be entitled to vote or hold office; but shall be considered as having been suspended and shall only be reinstated upon an affirmative vote of the Chapter, and the payment of all arrearages.

ARTICLE VII.

ORDER OF BUSINESS, AND RULES OF ORDER.

Section 1. 1. Calling the Roll.
2. Reading Minutes of Previous Meeting.
3. Reading Minutes of Special Meeting.
4. Reports of Standing Committees—Executive, Trustees, Finance, etc.
5. Reports of Special Committees.
6. Reports of Committees on Applications for Membership.
7. Balloting on Applications for Membership.
8. Propositions for Membership.
9. Annual Address.
10. Reading Communications.
11. Unfinished business.
12. New Business.
13. Reading of Papers, Debates, Addresses, etc.

Sec. 2. Rules of Order may be suspended by a majority vote of the members present. But no By-law of this Chapter shall be suspended under any circumstances, except as provided in Article XI.

Sec. 3. At the annual meeting of each year the President, or such other person as he shall designate for the purpose, shall deliver the annual address.

Sec. 4. No motion or resolution shall be debated until it shall have been duly moved and seconded and each speaker shall be confined strictly to the motion under consideration.

SEPT. 1890. VOL. XI, No. 9.

Architects.

SEC. 5. No question shall be stated by the Chair unless properly moved and seconded, nor be open for discussion until stated by the presiding officer; and while a motion is pending before the Chapter, the only motions in order shall be:

1. To Lay on the Table.
2. The Previous Question.
3. To Indefinitely Postpone.
4. To Definitely Postpone.
5. To Recommit.
6. To Refer.
7. To Amend.

Each of which shall have precedence in the order in which they are arranged; and the first three shall be decided without debate.

SEC. 6. The previous question shall be put only when demanded by a majority of members present entitled to vote. When so demanded it shall be in the following form: "*Shall the main question now be put?*" If decided affirmatively, the main question shall then be put without further debate.

SEC. 7. An amendment to an amendment shall be in order, and take precedence of the amendment; but a motion to amend an amendment to an amendment shall not be entertained.

SEC. 8. A substitute shall be considered in the light of an amendment, and shall be treated as such. But no substitute or amendment shall be entertained, the object of which shall, in purpose or effect, introduce a subject different from that under consideration.

SEC. 9. The proceedings of the Chapter, not otherwise provided for, shall be governed by the rules and parliamentary usages and practices laid down in "Cushing's Manual."

SEC. 10. Discussions of religious or political subjects shall not be permitted at any meeting of the association.

ARTICLE VIII.

DEPORTMENT AND PRACTICES OF MEMBERS.

SECTION 1. Should any member be reported to the Chapter in writing, by any responsible party, under a properly attested affidavit, as guilty of unprofessional practices or disreputable conduct, calculated to reflect reproach upon the profession and this Chapter, the matter shall be referred to the Executive Committee for investigation; and said Committee shall notify the member so charged, requesting his attendance at a meeting of the Committee appointed for the purpose; and after a full investigation of the charges and facts, the Committee shall have the power to dismiss, or report the case to the Chapter for further action.

SEC. 2. Should the Committee find the charges of sufficient importance to justify action on the part of the Chapter, they shall prepare a statement to that effect, with recommendations as to the proper cause to be pursued.

SEC. 3. Should the charges be sustained, the offending member may be reprimanded by the chair, censured by a vote of the Chapter, or be expelled by two-third vote of the active members present voting in favor thereof, provided that the offending member shall have been notified of the action of the Chapter, and allowed one month to arrange and make his defense.

SEC. 4. A vote involving censure or expulsion shall be decided by ballot. Two-thirds of those present and entitled to vote being necessary in all cases of expulsion.

ARTICLE IX.

SCHEDULE OF MINIMUM CHARGES AND PROFESSIONAL PRACTICE OF ARCHITECTS, AS USUAL AND PROPER.

Adopted by the American Institute of Architects, October 23, 1884.

Adopted by the Western Association of Architects, November 14, 1884.

Re-affirmed by the American Institute of Architects, upon the consolidation of the Western Association of Architects and the American Institute of Architects, November 20, 1889.

For full professional services, (including supervision) five per cent. upon the cost of the work.

In case of the abandonment of the work, the charge for partial services is as follows:

Preliminary studies, one per cent.; preliminary studies, general drawings and specifications, two and one-half per cent; preliminary studies, general drawings, specifications and details, three and one-half per cent.

For work that costs less than $10,000, or for monumental and decorative work and designs for furniture, a special rate in excess of the above.

For alterations and additions, an additional charge to be made for surveys and measurements.

An additional charge to be made for alterations and additions in contracts and plans, which will be valued in proportion to the additional time and services employed.

Necessary traveling expenses to be paid by the client.

Time spent by the architect in visiting for professional consultation and in the accompanying travel, whether by day or night, will be charged for, whether or not any commission, either for office work or supervising work, is given.

The architect's payments are successively due as his work is completed, in the order of the above classifications.

Until an actual estimate is received, the charges are based on the proposed cost of the work, and the payments are received as installments of the entire fee, which is based upon the actual cost.

The architect bases his professional charge upon the entire cost, to the owner of the building, when completed, including all the fixtures necessary to render it fit for occupation, and is entitled to extra compensation for furniture or other articles designed or purchased by the architect.

If any material or work used in the construction of the building be already upon the ground, or come into the possession of the owner without expense to him, the value of said material or work is to be added to the sum actually expended upon the building before the architects' commission is computed.

SUPERVISION OF WORKS.

The supervision or superintendence of an architect (as distinguished from the continuous personal superintendence which may be secured by the employment of a clerk of the works) means snch inspection by the architect or his deputy, of a building or other work in process of erection, completion or alteration as he finds necessary to ascertain whether it is being executed in conformity with his designs and specifications or directions, and to enable him to decide when the successive installments or payments provided for in the contract or agreement are due or payable. He is to determine in constructive emergencies, to order necessary changes, and to define the true intent and meanings of the drawings and specifications, and he has authority to stop the progress of the work and order its removal when not in accordance with them.

CLERK OF THE WORKS.

On buildings where it is deemed necessary to employ a clerk of the works, the remuneration of said clerk is to be paid by the owner or owners, in addition to any commission or fees due to the architect. The selection or dismissal of the clerk of the works is to be subject to the approval of the architect.

EXTRA SERVICES.

Consultation fees for professional advice are to be paid in proportion to the importance of the questions involved, at the discretion of the architect.

None of the charges above enumerated cover professional or legal services connected with negotiations for site, disputed party walls, right of light, measurement of work or services incidental to arrangements consequent upon the failure of contractors during the performance of the work. When such services become necessary, they shall be charged for according to the time and trouble involved.

DRAWINGS AND SPECIFICATIONS.

Drawings and specifications as instruments of service are the property of the architect.

ARTICLE X.

DUTIES AND RIGHTS OF MEMBERS.

SEC. 1. It shall be the duty of all members of this society to aim at excellence in conduct and qualification; to have an eye single to the interests of their employers, and to the advancement of the art; and while, in nature of society and business, each will come into competition with the other, our emulation should be to perform the *best* work, rather than the most of it.

SEC. 2. It shall be the duty of all members of the Chapter to maintain their rightful authority in the direction of all work under their charge, not recognizing the right of interference from any source; and to discourage and discountenance all methods of obtaining professional engagements, not of a worthy and reputable character, and by direct negotiations with the owners or their *legal* agents.

SEC. 3. It shall be the duty of the members of this Chapter to refrain from and discountenance any and all attempts to supplant a fellow-member by proposals abating charges, or by any other violation of the strict rules of right and honorable practice, so as to deprive him of any properly and fairly secured business advantage or engagement.

ARTICLE XI.

AMENDMENTS.

SEC. 1. These by-laws may be amended at any regular meeting of the Association, provided that the proposed amendments shall have been submitted and read at a previous regular meeting, and also a copy thereof in printed form delivered or mailed to each member at least twenty days prior to the date of proposed final action thereon. A two-thirds vote of the members present and entitled to vote shall be necessary to final adoption.

SEC. 2. All amendments adopted as provided in Section 1 shall take effect immediately after adoption, unless otherwise specially provided.

BUSINESS MOSAICS.

We wish to call the attention of our readers to several errors in relation to the names of some of the contractors who were employed in the construction of the California State Bank.

Mr. David O'Neil of 314 Montgomery street, was the contractor for the brick, stone and iron work, and will be pleased to give any information sought for about the stone used in the building.

C. F. Weber & Co., cor. Post and Stockton Sts., agents on the Pacific Coast for A. H. Andrews & Co., Chicago, Ill., were the parties who furnished and put up all the hardwood finish for the interior.

W. M. Fletcher was the contractor for all of the carpenter work, whose office is at 330 Pine Street, San Francisco.

Mr. P. H. Jackson, of No. 228 First street, has recently made some experiments in order to demonstrate the utility of a combination of iron tension rods with concrete work, the lower or tensile portion being formed of iron of special form, and bedded in the concrete mass.

The arches were constructed in three parts, the abutments and haunches each forming about a third, and the center or key portion the remaining one-third, having a clean and separated joint, viz.: not cemented to the haunches. The vertical depth of the abutments and haunches formed the beam, which in this case was 16.0 between supports. In the lower portions of these beams, or haunches, was inserted iron ties and beams to resist the tensile strain, these ties were of the smallest I beams, and bars or ties made of the form advocated by the inventor. As a general rule failures occur because of some unexpected strain or settlement takes place in some portion of the structure. This experiment followed the general rule, and herein lies the especial advantages of the separate key block construction, as through unequal settlement of the supporting walls, which were only temporary, various cross and twisting strains were brought to bear which fractured a portion of the construction, while the separate key stone prevented the fracture extending the full width, and thereby preventing the fall of the loaded platform. The improved tie rod combination proved its superior advantages over all the other forms. Mr. Jackson owns the patents for these improvements which this test has demonstrated to be of great advantage for the purposes intended. The cut on our advertising page shows the construction quite fully.

John Mallon the Pioneer Glass Cutter is still very busy at his old place, 19 Fremont Street, cutting, grinding and engraving glass. If you would like to know how the beautiful plates that ornament the front doors and transoms of our palatial residences of the city are made to tell stories and legends of the past, call and spend an hour at his manufactory and investigate the methods adopted for embellishing the crystal metal.

CITY BUILDING NEWS.

Alabama near 22nd. One-story frame; owner, M. Hayes; contractor, L. J. Arthur; cost $1,770; signed, Aug. 11; filed, Aug. 11; payments, $400; enclosed, $400; brown coated, $475; completed, $450; 35 days.

Buchanan cor. Washington. Brick and concrete work; owner, A. G. Hawes; architect, A. P. Brown; contractor, McGown & Butler; cost, $4,685; time, 60 days; signed, Aug. 20; filed, Aug. 27; payments, 75 per cent. as work progresses, 25 per cent. 35 days.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE ARCHITECTS, meets second Friday of each month at 408 California Street.
SETH BABSON, Pres. W. P. MOORE, Vice-Pres.
OLIVER EVERETT, Sec. JOHN W. CURTIS, Treas

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at 408 California Street.
JOHN RICHARDS, Pres. PROF. FRANK SOULÉ, Vice-Pres.
OTTO VON GELDERN, Sec. JAS. SPIERS, Treas.

ON and after January 1, 1891 the subscription price of this journal will be $3.00 per annum and single numbers 30 cents each.

IN our last issue the 1st mention in the Hall Clock competition should have been credited to H. J. Van Black, and the 2nd mention to S. C. Benson.

A JURY in Judge Hunt's court has given judgment for plaintiff for $250 in a suit brought for $2000 damages for injury to property caused by a quantity of earth sliding from defendant's lot on to plaintiff's premises.

THE mentions in the monthly competition of the A. I. A. Sketch Club for August should have read *A Country Chapel* instead of *A Hall Clock*.

THE regular monthly meeting of the San Francisco Chapter, American Institute of Architects, was held Friday evening, the 10th inst., at their rooms, 408 California Street.

President S. Babson in the chair.

About thirty architects were present, many of whom took an active part in the discussion of the evening.

Three applications were made for membership.

THE regular meeting of the Technical Society of the Pacific Coast was held on October 3d, at their rooms, 408 California street, President Richards in the chair.

The subject was an illustrated paper by Mr. H. C. Behr, on experimental works for metalurgical operations.

THE following is a translation of a review of the tenth volume of the CALIFORNIA ARCHITECT AND BUILDING NEWS, by *Daniel Francken* published in the *L'Emulation* of Bruxelles, the organ of the *Société Centrale D'Architecture De Belgique*. The original of which was sent to us through the kindness of *Paul Saintenoy, Architect* and *Secrétaire Général de la Société d'Archéologie Bruxelles*.

THE CALIFORNIA ARCHITECT AND BUILDING NEWS.

AT the begining of this century, California was hardly known in Europe, being then a tributary of Spain. It was acquired by the United States of America in 1848, and soon became celebrated by the discovery of its gold mines. The placers worked by new comers rushing thence from all parts of the world, produced untold riches, as much as four hundred millions of francs in one year. The other productions of the soil, silver, borax, sulphur, coal, tin, coal-oil, etc., favored the growth of a new cosmopolitan civilization of considerable extent, which caused the springing up of numerous cities rapidly and richly built. Immense forests producing trees of collossal size, consisting of firs, cedars, pines, etc., thus favoring the construction of frame dwellings by the inhabitants solely in accordance with their fancy, and somewhat in the style in vogue in their country. Hence, fancy and diversity are the chief characteristics of California architecture. Although Sacramento is the capital, San Francisco is the most important city in the State, of which the CALIFORNIA ARCHITECT gives many illustrations. This city is situated on the San Francisco Bay at the

Golden Gate, and is bounded on the west by the Pacific Ocean, and not far away are the mouths of the two great rivers, the Sacramento and the San Joaquin. This city is destined to become one of the principal ports of North America, and has been justly named the "*Queen of the Pacific.*"

The California Architect is a most interesting publication, counting already twelve years of existence, and showing the splendor of that country by means of drawings well executed, of numerous private dwellings, hotels, establishments of public utility, of luxury, of science of art, etc. Certainly in looking over that journal, the text of which is in a language with which I am too imperfectly acquainted, the mixtures or incongruous architecture here somewhat startled me. But from a more extended examination most of the plates that illustrate the journal are very neatly executed, and that notwithstanding the cosmopolitan influence, a very picturesque and most interesting style of architecture has been developed in that new country. In the first place most of the buildings are isolated, the main streets are lined with houses surrounded with gardens and terraces, hence results a perspective view of projecting roofs and walls very pleasing to the eye.

The large constructions, the buildings for revenue, the hotels, &c., are constructed of gigantic proportions. The great aim of the California constructors seems to be to astonish by enormous size, than by artistic refinement. However, certain buildings are very elegant.

The one of Messrs. Salfield & Kohlberg on Market street possesses an *avant corps* which certainly is not wanting in good qualities.

Mr. Mooser, in his Metropolitan Temple, has made a success of the upper portion of his edifice. It is to be regretted that the ground floor, and the first story are treated in a manner too empoverished.

The Hibernia Bank, by Messrs. Pissis & Moore, is conceived in the classic style, and possesses beautiful qualities, and the purity of its lines, prove for its authors, real artistic researches. The dome that crowns the rotunda blends very gracefully with the other portions of the edifice.

Messrs. Pissis & Moore have also erected a building very well proportioned; it seems to represent a private dwelling of a very fine aspect. The perspective drawing shows us the two fronts, one of which, adorned with a portico, decorated with a double arcade, preceded by an exterior stair case with a lateral flight leading to a platform forming a terrace. The second front is flanked with a two-story bay window, on graceful brackets, surmounted by a balcony, covered by a very projecting roof. The two fronts are united by a cut-off corner, ornamented by a story higher than the roof, the ground floor of which forms the principal entrance. This entrance is decorated with a semi-circular arcade resting on isolated columns after the Italian style; the first story is adorned with a handsome bay window supported by a rounded corbel.

Certain villas denote great originality, and I am sure that in execution they produce general effects very pleasing to the eye, built for the most part on an irregular plan, adorned with stairs placed on the exterior, and of large platforms covered with great roofs, of basements constructed of rough stone, they constitute very curious specimens of American architecture. The use of large semicircular arcades, and of certain elements borrowed from the Nations of the Orient, help to add still more to the picturesqueness of the City of San Francisco. Moreover, the joints of the stone work, and the mode of construction, partly sham, the very ingenious use of lumber for framing of certain buildings contribute greatly to the decorative effect of many dwellings. Here and there you find architecture recalling the Middle Ages. A porch of Messrs. Wright & Sanders is interesting, excepting the upper part, where great weight is not very graceful. Let us also call attention to a coquettish chalet of Mr. T. H. Cole, who has conceived the idea of giving to the windows of the ground floor the shape of the circle. The group of buildings by Mr. Barnett on Haight street betrays its English origin. The *Marquam*, by Mr. J. M. Wood, whose dimensions cannot find their counterpart in this country, the principal facade alone, without counting the other two, is pierced with more than two hundred windows.

The residence of Mr. W. H. Crocker erected by Messrs. Curlett & Cuthbertson, offers, although without a very definite style, a very curious *ensemble*, and is most attractive in all its parts. Erected on an enormous stylobate of rough stones, it raises itself gracefully on an irregular plan. The gables of wood are well arranged, and ornamented with balconies, chimneys and bay windows. One of the angles is flanked by a tower, a little massive perhaps, but very originally studied. The principal entrance, preceded by a flight of stone steps of generous dimensions with double ramps, is decorated with a semicircular arch, with the center raised, formed of large rough stones, and resting on sphinxes in repose. The entrance is of colossal aspect, unhappily supporting only a terrace, and has no *raison d'etre.* The balance of the building is of wood. The same plate, due to photography, shows us in the back ground an angle (or corner) of a beautiful specimen of a renaissance building, which I regret, was not reproduced in a complete state in the publication. I conclude this rather long review by congratulating our California *confréres*, and in the name of the *la Société Centrale*, thanking them for the very interesting numbers of their Journal which we have received through their courtesy.

Daniel Francken.

Correspondents must not forget to give their names and address, as the editors cannot publish anonymous communications, nor will they hold themselves responsible for opinions expressed by their correspondents.

San Francisco, Oct. 3rd, 1890.

Editor California Architect and Building News,

Dear Sir:—I beg to call the attention of your readers to the subject of the proper construction of fire-doors and shutters, a matter of vital importance in any fire, and especially so in the sweeping conflagrations which eventually come to all large cities.

Notwithstanding constant agitation of the subject, and the use of illustrated circulars to keep proper construction before the public, it is a fact that the popular idea of a fire-proof door or shutter is still one of iron, presumably because iron is not inflammable. While iron will not burn, it will so warp and twist when exposed to intense heat as to be of little or no use as a protection. So general is the predilection for iron, that frequently before openings are cut between adjoining buildings, it is inserted in the lease that the opening shall be "protected" with a "first-class iron door."

It is a well-established fact that the reliable fire-door or shutter is that made of two thicknesses of matched boards placed crossways and nailed together with iron clinch nails. Covered with tin laid as in roofing so that the nail heads are covered, carefully fitted, and properly hung, using bolts instead of screws in hangers and fastenings, such a door or shutter is invincible. To protect a communication between two buildings, (the weak point in event of a fire in either) such doors should be placed on each side of the wall, the air space between the two being an additional protection.

In making fire-doors or shutters, the standard specifications, should be followed exactly, such deviations as the substitution of iron for tin, in which case the nail heads are exposed and the nails drop out quickly when exposed to fire, or the use of screws instead of bolts in hanging, seriously impairing the efficiency of the protection. It should be remembered that if fire-doors or shutters are ever put to a test it will surely be a severe test, and experience shows that anything less than the best will be found wanting in time of need. The standard fire-door or shutter may have its wood reduced to charcoal by the intense heat, but it will be found to have kept its shape and to have kept out the fire. The cost of such protection is less than that of iron doors.

Respectfully,

F. H. Porter, Chief Inspector.

The management of this journal desires to extend a cordial invitation to all architects on this Coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE illustrations for this number are, A Perspective View of a Suburban Residence with 1st and 2nd floor plans by Seth Babson, architect.

PERSPECTIVE View and floor plan of a Bank Building suitable for a large city by F. R. Barker, architect.

A FRONT View of the Entrance to the London and San Francisco Bank, S. F. by David Farquharson, architect.

CALIFORNIA VENEERS.

California and the Pacific Coast is noted throughout the world for its wonderful productions, and not the least of these are the ornamental woods suitable for the most delicate effects of the artistic designer in fancy woods, wherever he may be found, whether in the countries of the new or old world. Their beauty is appreciable by all, from the savage to the most cultivated æsthetic taste, their rich tones and ever changing shades cannot fail to bring exclamations of approval. If the wonderful Aladin was now to build his palace the expert sprites would certainly procure their fancy woods from this part of the world.

At the Fair of the Mechanics' Institute, now being held in this city, there is an exhibit of veneers by the California Veneer Works, R. P. Hurlbut, Manager, 539 to 563 Brannan street, this city, which for beauty surpasses the most fairy dreams of the artistic wood worker. Here can be seen our native red wood in all its varied beauty, such as burls, roots, curls, curly bolts, of all shades, mottled, specked, feathery, clouded and sprayed, from the thickness of paper to two inches or more, and showing a combination of rich tones unattainable with any other wood. Here also is shown some artistic furniture and mantels, carved and plain, but all worked in a manner to display the contrast of the different shades and grains of the wood. The finish is varied throughout the large collection of woods exhibited, some showing the natural wood smoothed, but without varnish or polish, others are oil finished, varnished or polished, etc. When we view this suberb display it seems astonishing that eastern architects, designers, and manufacturers of artistic wood work should be so slow to look into the adaptability and beauty of our Pacific Coast woods.

L'UNIQUE,

A NEW ART.

More thought has been given at different periods of civilization to the obtaining of esthetic effects for the interior of residences than, perhaps, any other matter in the history and evolution of architecture, and in our sunny California it is interesting to note the growth of refined taste to which so many of our architects are now called upon to cater. Our State, we consider, is as remarkable for its architectural growth as it is for the enterprise and liberality of our many millionaires. It is suggestive to the ambitious designer, that here in the far West, the elegant portiere has within a decade or so supplanted the miner's gunny sack which once draped the openings of his mountain castle, and that the elegant "modern residence" of the Queen Anne, or other type, has taken the place of the "candle box" style which was once the pride of the "contracting architect, shingler and builder" who furnished "plans," etc., for *glory*, and made the rattle-trap thing cost in extras and repairs twice the amount of his original contract. It is, therefore, encouraging to note architectural advancements made in residences and business structures in both city and country, and, also, a real growing demand among clients for the many modern features which go to make the American home beautiful, "a joy forever." Hence, it is with much pleasure that this journal announces the introduction of a new (and a California) art—L'Unique. It is intended for the decoration of walls, ceilings, cornices, centers, pilasters, columns, arches, etc., and is susceptible of the widest range of unique design, and semi-oriental treatment. Its combination with natural wood finish together with the delicate tones and reflecting lights of art glass, stained and embossed, bring about a union of rich features that make the *ensemble* of a suite of properly furnished rooms an esthetic whole that brings a thrill of pleasure to the tired thought of the business man, or the devotee of society who, when they enter such richly equipped apartments can say, "I'm now at home." L'Unique has to be seen, neither a photograph nor words can make it clearly understood; however, we may mention that the material of its composition is the most durable known to science in the stucco art. It is susceptible of being treated in a variety of sunk, raised, geometrical or conventional figure work, which, when artistically treated in color and bronze, give effects which are decidedly Oriental in their rich character. The art as its name implies is destined, by the cultured hand, to stand alone in kind and excellence. For the housekeeper it has the advantage (although showing a roughened surface,) that it will not absorb dust, for the reason that its composition makes it entirely impervious to moisture, and when finished a coating of material is applied which forms a chemical combination, giving an enameled surface to the work to which the dust will not adhere. It constitutes the richest and most natural background yet brought out for modern furniture, and its assimulation therewith gives the impression that *the room itself* is but a part of the setting. L'Unique bears such a variety of treatment, both in ground work and in the coloring, etc., that no two apartments need be finished alike, and the eye in wandering from room to room meets with a constant yet harmonious change of surface, just decorated enough to be pleasing and appropriate.

The excellent exhibit of a large variety of designs in this art may be seen on the walls of the western end of the promenade adjoining the Art Gallery of the present Fair of the Mechanics' Institute. The inventor and patentee is Mr. T. Tucker, of No. 1816 San Pablo Avenue, Oakland, California. Mr. Tucker has finished and decorated the best apartments of many elegant residences in this style which in most instances has drawn such an influx of visitors as to hinder the workmen so that the admission of visitors was relegated to those most interested.

FIRE APPARATUS.

A fine display of fire hose, hose reels and fire apparatus is made by W. T. Y. Schenck, 222 and 224 Market street, the most noticeable being the Schenck Swinging Hose Reel rated by the Insurance Union to be the most perfect and reliable inside fire protection it is possible to procure. The reel is attached to the wall out of the way and is a very handsome ornament, forty-eight of them being recently placed on the hall walls of the Palace Hotel, and they are specified by the architects to go into all the prominent buildings now being erected.

The house manufactures all kinds of fire apparatus and is the only establishment making a specialty of such work on the coast.

USE OF GAS STOVES.

The fuel and the appliances to be used for cooking and heating for the homes of the period are subjects which are at present receiving a marked degree of attention. To the manufacturing gas companies it is of the first importance, and the manufacturers are concentrating their attention to the practical development of an article that will be satisfactory as an illuminant and at the same time have the requisite qualities for a fuel gas.

Gas stoves for cooking are supplied in various patterns from the single burner to six and eight heating places, having burners ranging from six to twenty feet each per hour. The ranges are in some cases supplied with water backs, the tops may have steel or cast iron plates, and ovens are made close or ventilated that bake quickly and evenly. Nickle plated trimmings and pipes with perfect combinations which regulate the supply of gas. The heating stoves are made plain or rich in design, many showing unique features and ornamented with tile work. With the great variety of stoves made the different systems of burners would naturally follow, thus we find the old and well tried Bunsen principal, and the small, sharp, blue flame distributed over a larger surface, each presenting superior claims for efficiency for special purposes.

After all the experience of recent years there can be no doubt of the superiority of gas over the ordinary fuel for cooking and heating purposes, and as the wants of the consumer become known new appliances will come into use to meet the demand. Among the many advantages of gas over coal are economy, security, convenience, cleanliness, being free from the smoke, ashes, soot and dust nuisance, and in lessening the labor and expense of handling the coal and ashes, also the saving of kindlings. The coming man will be surprised at our patiently enduring the smoke, ashes, soot and dust for so long a time after science had demonstrated the economic methods of gas as fuel. The efficiency of cooking by gas has been demonstrated by recent tests which showed that meat retains its weight and nutrition better when cooked by the gas process than when coal is used. With gas the cooking can be commenced at once while by the coal stove the fire must be made some time before. By the coal stove, food that required two hours and forty minutes from the time of lighting the fire till ready to serve, took only one hour and fifty minutes to do the same work equally well, and when the gas was turned off the expense was stopped, while with the coal stove the remaining charge of unburned coal and heat being lost. By the present neat gas range, which is always ready for instant service, and free from dust, soot, fuel or ashes and the attendant labor therefor, the culinary operations are a pleasure, the heat being so perfectly under control that the most delicious dishes can be prepared, done just to a shade, to suit the most fastidious taste of the discriminating epicure.

The growing demand and increasing use of gas stoves and heaters is of the highest importance to the architect. Naturally any device whereby such a radical change is made in the mode of cooking and heating as that at present taking place by the substitution of the gas system for that heretofore in use, requires special arrangements in the planning of the house in order to meet such improvements in the most complete manner.

TERRA-COTTA.

The history and manufacture of terra-cotta dates from prehistoric time, unglazed pottery of very ancient origin having been found. The potter's wheel and vessels of burnt clay were common articles among the nations that existed more than 4000 years back, and now when we want the most enduring material known we resort to the prehistoric terra-cotta. During the last few years science has greatly assisted the manufacturer so that now, prepared clay having the proper chemical constitutents can be worked for any intended purpose whatever, and colors may be introduced into the plastic mass to give any desired effect, so that this valuable product can be made to harmonize with any other material. It is only within the last few years that wooden framed walls and partitions, have been constructed with fire resisting terra-cotta hollow tiling, in such manner, as to form a complete barrier to the spread of fire. Interior columns, beams and girders encased in terra-cotta, has become so general in use that the fire proof building is the rule rather than the exception. Terra-cotta is more particularly used for the higher class of brick buildings, where more or less ornamental and art work adorns the exterior on account of its durability and fitness for moulded or modeled work of either a structural, ornamental or monumental character. Where exposed to the weather colored stone will fade, grow dull and lose its contrasting effect, while terra-cotta retains its color and gives the combination of tints and shade as originally intended by the designer. At the Mechanics Fair is an extensive and beautiful display of terra-cotta in all its various forms as manufactured by Messrs. Gladding, McBean & Co. 1358-1360 Market street, this city, which is a magnificent testimonial for the high class of the articles manufactured by them. The care and precision observed in working out the constructive details is apparent throughout all the examples. The product from this house may be seen throughout our city, such buildings as the Pioneer Hall, Chronicle Building and many others show to advantage by their use. The modeled work for heads of persons and animals shows a practical art knowledge of such subjects as fitted for special positions to produce the intended effect. Special designs of architects are taken and worked to order for particular purposes.

IMPROVEMENT FOR SASH BALANCE.

One by one the old and cumbersome methods of the past age are being replaced with new and improved appliances whereby the convenience of the household is increased to such an extent as to render life more pleasant for the rich or poor alike. As a troubled state of the mind is not considered beneficial either for health or long life, consequently, any improvement in the construction of buildings, whereby the mind is brought to a condition of calmness and contentment, must necessarily prove beneficial. Who has not heard the remark upon opening or closing a window, "I wish somebody would invent something that will work better than this." Now, just here comes in the California Sash Balance Company, who are prepared to furnish a new device, acting upon an entirely different principal from anything heretofore used for this purpose. This appliance is one of those improvements, that the more it is critically examined, the more apparent are the advantages to be derived from its use. The device is the invention of Dr. Benjamin Marshall, of this city, who has carefully studied out the details to the present practical adaptability for the purpose intended. In this new arrangement, the cords, weights, pulleys, box frames, together with the resultant annoying repairs and expenses are entirely done away with. When designing small brick or terra cotta piers between windows, it often becomes necessary, in order to make room for the boxes for weights, that such piers should be from four to eight inches larger than would be required if no boxes were used, so that with this new balance the piers may be reduced to a size calculated by the designer. The moving power which balances the sash being one or more double spiral springs which are let into the sash in a manner not to weaken the sash. For the lower sash the spring is worked into the lower rail, and for the upper sash into the upper rail. On the outer end of this spring is a cog wheel working against a toothed rack secured to the frame, while in the sash is a sunk turn-key connected with a sliding pin bolt which locks into the cog wheel, thereby locking the cog wheel to the rack, so that either the lower or upper sash can be easily locked in any desired position. In many cases, such as lower story windows, and windows opening on balconies, halls, light corridors, etc., this device is the most applicable of any yet brought forward. The springs are made of the very best spring steel to be had, and worked and tempered especially for this purpose. The tortion of the spring is set to regulate the tension to any weight of sash. The device has the elements of durability and economy, and is easily applied, owing to its simplicity; the windows cannot rattle, and the balance can be regulated to a degree of delicacy hitherto unknown. This invention has been ordered for the following new buildings in course of erection: Crocker Building, D. O. Mills Building, San Bernardino Insane Asylum, and many private residences. A window complete with this arrangement is at present on exhibition at the Fair of the Mechanics' Institute.

DISPLAY OF ORNAMENTAL WOODS.

Among the many interesting displays that meet the eyes of visitors at the Mechanics' Pavilion, there is one, which no doubt, all will examine with surprise, that of the display of ornamental native woods, by A. J. Forbes & Son, 213 Mission St.

That there should be such handsome specimens of ornamental woods obtainable from the common red wood, white cedar, and myrtle,—specimens that rival in beauty the fine woods that are imported from the countries south of us at great expense, is probably known to but few of the observers, and they may take the statement with a great deal of allowance when it is made, that the woods from which these specimens are obtained, are cut up and sold by the car load for fire-wood.

The first and most important on exhibition in its adaptability for construction of cabinet work, is the *Madrone*, this wood has a fine grain, is easily worked, and is very strong. It is unexcelled for the numerous uses to which it can be applied.

Then comes the *Myrtle* a strong and beautiful wood. The exhibitor says, "we have boards forty inches in width perfectly sound." Next in importance in the cabinet-shop is the *Port Orford Cedar*. The specimens on exhibition are probably the finest that have ever been seen, rivaling the famous *Satinwood*. The *Sycamore* is used for flooring and for the manufacture of domestic utensils. The *Nutmeg* wood is extensively used in the northern part of the state. The Red wood specimens are from the most prominent mills on the coast. A burl from C. A. Hooper's mill is, for its size (5 feet, by two feet 6 inches) the most perfect piece of burl that has been seen in this market, nor could it be matched in any country outside of California. Those from Dolbees & Carson, Fort Bragg, and from Capt. C. Nelson's mills and others from Humboldt, Mendocino and Tulare counties are also beautiful specimens of curly *redwood*. These do not comprise all the cabinet woods of the state, but these have all been tested and can be relied upon, and in the skillful hands of A. B. Forbes & Son, can be wrought into household furniture, office and store fittings, and bank decorations that will please and satisfy the most fastidious of tastes. To them we recommend all who are particular in having their work done in the most substantial manner.

BRICK.

The manufacture and use of bricks made of clay, and burnt to a degree of hardness to withstand the weather, and of strength sufficient to sustain the weight of structures erected to a considerable height was known and practiced by the nations of the earliest times. Assyrian, Egyptian and Greek history mentions bricks as a common building material. The ancient cities of Pompeii and Herculaneum were built, mostly, of bricks or tiles made 17 inches long, 11 inches wide, 1¾ inches thick. In the Coliseum at Rome the thickness ranged from 1¼ to 2 inches, and Dutch, French and English 1¾ to 2¼ inches till about the 14th century. At present the American bricks range from 2 to 2½ inches; thus from the experience of centuries in brick making it seems that not more than three to four inches thickness of material should be used to insure a substantial article. The first building erected in America of which we have any account was built on Manhattan Island in 1663, the bricks having been brought from Amsterdam. Many improvements have been made at different times in the art of making bricks so that at this time it has become a science which requires technical knowledge in combination with experience of an advanced order; and machinery of the best kind made expressly for the work in hand. By the old methods of working and molding the clay the bricks were as strong or stronger in the direction of the width as in the length, while by the present method there is formed a kind of grain running lengthways thus making a stronger brick, consequently a stronger wall than if built with the ordinary article. At the Fair of the Mechanics Institute now being held in this city, a splendid array of pressed and moulded bricks and terra-cotta work, made by the Union Pressed Brick and Terra-cotta Co. (whose office is in the Flood Building, this city,) cannot fail to please the architectural and building fraternity. Bricks and tiles are here shown ranging through all shades and tints of color, from light buff to a rich dark chocolate; and Roman tiles of various shades, also some beautiful ornamental terra-cotta, especially a mantle for a fire-place of most delicate carving. All the products from this firm show a close texture and even surfaces, square corners, clean cut moldings, and good color. They make molded bricks of any size, pattern, design, or color, having the faces picked, vermiculated, ribbed, beaded, moulded, and in imitation of any style of face cut stone work. The color of these bricks being permanent, fulfills the requirements of a material having a lasting chromatic effect.

THE GARDNER SASH BALANCE CO.
